PUBLISHERS' NOTE.

THE INTERNATIONAL CYCLOPEDIA contains a reprint in full of *Chambers's Encyclopædia* supplemented by some 20,000 copyright articles added by American editors, the whole arranged for consultation under a single alphabet. The total number of titles is now 49,646. The titles of articles from *Chambers's Encyclopædia* are in bold-faced type —**AMERICA**. The titles of the American articles, whether on new topics or enlargements of the old, are in plain capitals—AMERICA. The word *ante* refers the reader to an article from *Chambers's* reprinted in this issue. Whenever the word (*ante*) follows a title in the American additions, it indicates that that article is an enlargement of one under the same title in *Chambers's Encyclopædia*, usually to be found immediately preceding.

An asterisk (*) prefixed to an article indicates that additional information will be found under the same title in a supplement at the end of the volume.

MINNESO'TA, one of the United States, lies in lat. 43° 30′ to 49° n., and long. 89° 29′ to 97° 5′ west. It is 380 m. in extreme length from n. to s., and from 183 to 337 from e. to w., containing an area of 83,531 sq. miles. It is bounded on the n. by the British possessions, from which it is separated by the chain of lakes and rivers connecting the lake of the Woods with lake Superior, and by the 49th parallel of latitude; e. by lake Superior and Wisconsin; s. by Iowa; and w. by Dakota territory (q.v.), from which it is partly divided by the Red river of the north. It contains 75 counties, and its chief towns are St. Paul, the capital, Red Wing, Winona, Hastings, Minneapolis, etc. Minnesota contains the summit of the central table-land of the North American continent, where, within a few miles of each other, are the sources of rivers which find their outlets in Hudson's bay, the gulf of St. Lawrence, and the gulf of Mexico. The state is abundantly watered by the Mississippi, Minnesota, Red river of the north, Rainy Lake river, and their branches, and has more than 1500 m. of navigable rivers. The country abounds also in lakes and ponds. The sources of the great rivers are 1680 ft. above the level of the sea. Though the most northerly state in the union, Minnesota is one of the most beautiful, fertile, and salubrious. The winters are long and cold, but equable, and the country is rich in fertile lands and forests. The clear waters are stored with fish, and game is abundant. The scenery is varied and beautiful. The falls of St. Anthony on the Mississippi afford abundant water-power. Near these is the beautiful cascade of the Minnehaha, or laughing water, 45 ft. perpendicular, and a cavern, explored to the depth of 1000 feet. Minnesota began to be settled in 1845, though it was explored by the French and trading-posts established in 1680. The chief route to the British settlements of the Red river of the north lies through Minnesota. The state has plenty of good timber, and is rich in minerals, including gold, iron, copper, coal, and lead. In 1870 its agricultural products were valued at $33,446,400. In the same year it had 6 universities and colleges, and 2,424 public schools. In Jan., 1875, 1940 m. of railway were completed, and about 1000 more projected, towards which grants of land had been made to the extent of nearly $4,500,000. Powerful Indian tribes occupy portions of the state. The state government was organized in 1858. Pop. '60, 172,023; in '70, 439,706.

MINNESOTA (*ante*). In 1680 a party of French fur-traders ascended the Mississippi to the falls of St. Anthony, where they formed a settlement. Louis Hennepin, a Franciscan priest, accompanied them, and gave the falls the name which they have since borne. This was the first white settlement made within the limits of the state, and it soon degenerated by the adoption of Indian manners and habits. In 1763 the territory was ceded to Great Britain; in 1766 it was explored by capt. Jonathan Carver, of Connecticut; and in 1783 it become a part of the United States, and was included in the northwest territory. In 1805 a tract of land at the mouth of the St. Croix and another at the mouth of the Minnesota were purchased of the Indians, but the region was settled slowly. In 1820 fort Snelling was built, and two years later a mill was erected on the site of Minneapolis. In 1823 the first steamboat ascended the Mississippi to the falls of St. Anthony. Some time before 1830 a small colony of Swiss settled near St. Paul. It was not until 1838 that the Indian title to lands e. of the Mississippi was extinguished, and a settlement was commenced at Stillwater in 1842. In 1849 the territory of Minnesota was organized by act of Congress, the w. boundary being the Missouri river. The population of the territory at this time did not exceed 5,000. Two years later the Indian title to the lands (except the reservations) between the Mississippi and the Red river of the north was extinguished, and from this time the settlement of the territory was rapid, immigrants pouring in so fast that in 1857 congress opened the way for its organization as a state, and it was admitted to the union May 11, 1858. The new state grew rapidly in population, wealth, and intelligence. After the breaking out of the rebellion, 1861, the Sioux Indians, taking advantage of the absence of great numbers of able-bodied citizens, attacked the new settlements, massacring families, burning villages, and driving the almost defenseless inhabitants from their homes in a state of utter destitution. The assault had for excuse the injustice which has marked the whole history of the United States in its dealings with the Indians; but there could be no justification for the savage

cruelties inflicted upon the whites, nearly 1000 of whom perished. The outbreak was speedily and effectually suppressed, and the tribe removed from the state. There is still in the state a considerable body of friendly Chippewas, dwelling upon several reservations and making no trouble.

The surface of the country is, for the most part, undulating, with no mountain ranges, but with a low, broad elevation in the northern part, which divides the waters flowing toward the Mississippi from those which empty into Hudson's bay, and both these from those which find their way to the Atlantic through the St. Lawrence. The divide at its highest point of elevation is not more than 100 ft. above the adjacent country, though it is 1680 ft. above the ocean, and nearly 1000 ft. above the extreme s. part of the state, the descent toward which is so gradual as hardly to attract observation. Three-fourths of the state are rolling prairie, interspersed with oak openings, belts of timber, and innumerable small lakes, and drained by numerous streams of clear water. The remaining fourth includes the divide above-mentioned, the mineral tract near lake Superior, and the heavily wooded region around the sources of the Mississippi and the Red river of the north. The state is mostly drained by these two rivers, by the St. Louis, and their numerous tributaries. The chief affluents of the Mississippi are the Minnesota (itself a noble river, with numerous branches), the Root, Zumbrota, Cannon, Sauk, Crow Wing, Willow, St. Croix, and Rum river, the outlet of Mille Lacs lake. The Red river has several branches—the Buffalo, Wild Rice, Red lake, etc.; while the Ushkabwaka, Big White Face, Stone, Floodwood, and Savannah are tributary to the St. Louis. A multitude of small streams flow into lake Superior, while the Vermillion, Little Fork, Big Fork, and others discharge into the Rainy Lake river and the chain of lakes which form a part of the n. boundary of the state. The Mississippi is navigable within the state for 540 m., the St. Croix for 53 m., the Minnesota at high water for 300 m., the Red river for 250 m., and the St. Louis for 21 miles. One thirty-fifth of the entire area of the state is covered with lakes. The largest of these are Leech, Red, Mille Lacs, Vermillion, Winnebegoshish, Big Stone, Traverse, Cass, Otter Tail, and Itasca. The navigable waters of the state have a shore line of 2,700 miles.

Iron and copper ore of excellent quality are found in the section bordering upon lake Superior, and iron also in the s. and s.w. portions of the state. Gold and silver in moderate quantities are found in the neighborhood of Vermillion lake, but the region is so wild and inaccessible that the mines are not worked. The n. portion of the state, along the Red river valley and the basins of the lakes and streams which form the n. boundary, is one of the finest wheat-producing regions in the world. The prevailing forest growths in this region are the oak, beech, elm, and maple. The n.e., or mineral, portion of the state is less productive, though it yields fair crops. Much of it is covered with a heavy growth of pine, spruce, and other woods valuable for timber. The three-fourths of the state lying s. of the highlands is a country of unsurpassed fertility. About one-third of all the land surface of the state is covered with forest. A tract on both sides of the Minnesota river, over 100 m. long and of an average width of 40 m., is known as the Big Woods, wherein are almost every species of deciduous trees found anywhere in the northern states. On the prairies have been planted more than 20,000,000 of forest trees, the state tempting the owners of the land to this species of culture by liberal bounties. The hardier fruits, such as apples, crab-apples, pears, cherries, plums, grapes of the northern varieties, strawberries, raspberries, currants, blackberries, etc., yield abundantly. For peaches and the tenderer sorts of grapes the seasons are too short.

Among the wild animals most common are the gray and prairie wolf, bears, wild cats, raccoons, foxes, gophers, woodchucks, deer, rabbits, and squirrels. The principal fur-bearing animals are the otter, mink, beaver, and muskrat. Feathered game is abundant, including ducks, wild geese, pigeons, grouse, partridges, and wild turkeys. The smaller birds are of numerous kinds, many of them distinguished for their gay plumage or the melody of their songs. The climate is less rigorous than might be expected from the high northern latitude. The winters are indeed long, but the air is dry and the temperature even, on which account the state is a common resort of invalids, especially of those with pulmonary complaints.

The number of miles of railroad in operation in the state at the close of 1883 was 4,547. The total earnings of the roads in 1883 were $25,680,785; amount of earnings over expenses, $10,019,936. Among the principal roads are the Northern Pacific (with branches, 554 miles in state), Chicago and Northwestern, Chicago Milwaukee and St. Paul, St. Paul Minneapolis and Manitoba, St. Paul and Duluth, Chicago St. Paul Minneapolis and Omaha.

As an agricultural state Minnesota is not far from the front rank. The growth of wheat (mostly spring-sown) is immense, the yield per acre being larger than that of any other state e. of the Rocky mountains. Among the products in 1880 were: hops, 10,828 lbs.; milk, 1,504,407 galls.; butter, 19,161,385 lbs.; tobacco, 69,922 lbs.; wool, 923,170 lbs. The number of farms in 1881 was 81,089. 82,497 acres produced, in 1881, 505,717 bushels of flax-seed. Among the products in 1883 were: rye, 466,867 bush.; buckwheat, 135,270 bush.; potatoes, 13,216,868 bush.; hay, 4,372,849 tons.

Among the products in 1884 were: corn, 23,630,000 bush.; wheat, 41,307,000 bush.; oats, 36,100,000 bush.; barley, 8,618,524 bush. Nearly 500,000 gallons of sorghum syrup were produced, and the production of catawba wine equalled that of Ohio. The

entire area under cultivation was estimated at over 6,400,000 acres, and the total value of agricultural products at nearly $75,000,000. The annual product of butter exceeds in value $5,000,000. Silk worms are raised by the Mountain Lake Russian colony. The live stock in the state in 1884, was estimated as follows: horses, 318,655; mules, 10,050; cows, 364,496; other cattle, 439,897; sheep, 272,708; hogs, 431,902. In the state exhibit at the New Orleans exposition, 161 varieties of forage grasses were shown. The locust plague inflicted great injury upon the growing crops for three successive seasons, beginning in 1874. The insects, coming in vast swarms from the Rocky mountains and settling upon thriving fields, in a few hours devoured every vestige of vegetation. In 1874 the losses from this source were estimated as follows: Wheat, 2,646,802 bush.; oats, 1,816,733 bush.; corn, 738,415 bush.; potatoes, 221,454 bush.; and other crops in relative proportion. In 1875, in 16 counties, the losses were: Wheat, 1,432,573 bush.; oats, 842,965 bush.; corn, 500,958 bush. Coal abounds in the northwestern part of the state. From the mines at Vermillion Lake and elsewhere in the northwestern part of the state, a fine quality of specular hematite iron ore is obtained. The production of pig-iron in 1883 was 8,000 tons. Copper ore and plumbago are found on the north shore of lake Superior. Three districts manufactured, in 1882, over 788,000,000 feet of lumber.

The water-power of Minnesota is so abundant and so thoroughly diffused as to afford in every part of the state all the manufacturing facilities that could be desired. In 1880 the number of manufacturing establishments was 3,493, with a capital of $31,004,811; producing goods valued at $76,065,198; persons employed, 21,212. Among the principal lines and their productions are: Flour, lumber, sash, blinds, and doors; carriages, wagons, etc.; machinery, locomotives, etc.; agricultural implements, blacksmithing. The flouring mills number about 450, with capacity for manufacturing nearly 40,000 barrels daily. The total product in 1884 was 8,800,000 barrels, more than half of which was from the Minneapolis mills. The saw mills in 1884 produced lumber, lath and shingles valued at $18,000,000. Superior qualities of brick and stoneware are manufactured, and the hydraulic cement of Minnesota has a wide reputation. The flour manufactured in the state maintains the first rank. The assessed value of real estate in 1885 was $386,547,387; of personal property, $79,204,827.

The total receipts into the state treasury during the year ending Dec. 31, 1883, were $3,362,562; the sum disbursed was $2,729,354. The funded debt of the state in 1884, including $2,849,000 of the school fund investment, amounted to $4,482,000. The foreign commerce is carried on through the ports of Duluth and St. Paul, and by steamers on the Red river to Pembina, which is the port of entry for the "Minnesota district." The imports at the former place, in 1882, were valued at $50,989; exports, $591,492; imports at Pembina, $954,162; exports, $3,721,972. The shipping of M. in '84 consisted of one sailing and 66 steam vessels, and 12 barges. There were in the state in 1884, 50 national bank, with capital of $11,350,000; circulation, $1,995,849. There were in 1882, 22 state banks and trust companies with a capital amounting to $971,307; 109 private banks, and 4 savings banks. The insurance risks written in the state amounted to $122,070,500; the premiums collected, $1,596,353. The population of Minnesota in 1870 was 446,056; in 1875, 609,777; in 1880, 780,773. In 1881–82 over 100,000 immigrants settled in the state. The white natives in 1880 numbered 509,373; foreigners, 267,511, of whom a large proportion were of Scandinavian origin. The first settlers of the state were chiefly from New England, and they went to the new state with a fixed determination to establish therein schools and colleges of a high order of excellence; accordingly much has been done to this end. In 1882 the children of school age (5 to 21 years) numbered 315,950, of whom 196,643 were in school during some portion of the year. The number of school districts at that time was 4,637; number of school-houses, 4,260; valuation of all school property, $3,997,857; number of teachers in winter schools, 4,386; average monthly wages of male teachers, $36.50—of female teachers, $28.50. The average time in days of the schools was 100, and the whole amount expended for their support was $1,993,364. Five kindergärten schools were reported. There are high schools in many of the cities and larger towns, in which pupils are fitted to enter the university. The school fund amounted to $5,295,101; and it is expected that by the sale of lands devoted to the purpose it will be eventually augmented to $10,000,000. The state has 3 normal schools, one each at Winona, Mankato, and St. Cloud. The legislature appropriates $3,000 yearly for teachers' institutes. Women enjoy the right to "vote at elections for school officers and in matters pertaining to the schools," and are "eligible to hold any office pertaining solely to their management." The university of Minnesota, organized at Minneapolis in 1867, embraces seven departments, viz.: collegiate, scientific, literature, and the arts, agriculture and the mechanic arts, medicine, and law. In all these courses it is intended to be as thorough as any institution of the kind in the United States. It is endowed with both the university and agricultural college lands, which are expected ultimately to produce the sum of $1,000,000. Among other colleges are: St. John's, near St. Joseph's, a Roman Catholic institution, Carleton college (Congregational) at Northfield; Macalester (Presbyterian), and Augsburg (Ev. Lutheran) colleges, at Minneapolis, Gustavus Adolphus college (Swedish), at Vasa, Hamlin university (Meth. Epis.), at Hamlin; several seminaries especially for girls, and two or three business colleges. There are also three theological schools—the

Augsbury evangelical seminary at Minneapolis, St. John's Roman Catholic seminary, and the Seabury divinity school (Episcopal) at Faribault. The public institutions of the state are the reform school of St. Paul, the institution for the deaf, and dumb and the blind at Faribault, a soldiers' orphans' home at Winona, hospitals for the insane at St. Peter's and Rochester, the state prison at Stillwater, and the training school for idiots and imbeciles at Faribault. There is a private orphan asylum at St. Paul, and another at Shakopee.

In 1880, 223 newspapers were published in the state, 16 of which were dailies; in 1884 the number was estimated at 275. The principal denominations in '85 were Adventists, Baptists, Christians, Congregationalists, Episcopalians, Lutherans, Methodists, Presbyterians, Reformed Church, Roman Catholics, and Universalists. In 1881, as a result of foreign immigration, chiefly, the Roman Catholics stood first numerically, and the Lutherans second. The latter, in 1885, represented at least five nationalities: Germans, Swedish, Norwegian, Danish and Finnish. It was estimated in 1885 that one-fourth of the entire population of Minnesota was Scandinavian; their political prominence being shown by the fact that Scandinavians were treasurers in 30 counties, registers of deeds in 25, judges of probate in 17, auditors in 14, and sheriffs in 7. The Norwegians, in 1880, numbered 62,500, the Swedes, 39,176, the Danes, 6,071.

The governor and other state officers are chosen by a plurality vote for a term of two years. The governor receives an annual salary of $3,800. The legislature, composed of a senate and house of representatives, the number of whose members is fixed from time to time by law, meets annually, the sessions being limited to 60 days. St. Paul is the capital. The election takes place on the Tuesday succeeding the first Monday in November. The supreme court consists of a chief-justice and two associate judges, elected by the people for 6 years. The former's salary is $4,500. It has original jurisdiction in cases prescribed by law, and appellate jurisdiction in matters of law and equity. In this court there are no jury trials. There are 11 judges of the district courts, each of whom is elected by the people of a district for a term of seven years. In Ramsey co., embracing the city of St. Paul, and Hennepin co., embracing the city of Minneapolis, there are courts of common pleas, whose judges have the same tenure of office as those of the district courts. Minnesota furnished to the army and navy during the war for the suppression of the rebellion more than 25,000 men. The electoral votes of the state for president and vice-president of the United States have been cast as follows: 1860, 4 for Lincoln and Hamlin; 1864, 4 for Lincoln and Johnson; 1868, 4 for Grant and Colfax; 1872, 5 for Grant and Wilson; 1876, 5 for Hayes and Wheeler; 1880, 5 for Garfield and Arthur; 1884, 7 for Blaine and Logan.

MINNESOTA, or ST. PETER'S **RIVER**, rises near the eastern boundary of Dakota territory, United States, runs s.e. 300 m. to South bend, then n.e. 120 m., and falls into the Mississippi at Mendota. It is navigable for 40 m. by steamboats.

MINNESOTA, UNIVERSITY OF, at Minneapolis, Minn., founded in 1868 under state control, consists of the collegiate departments, with 4 courses of study; the college of science, literature and the arts; the college of agriculture; the college of mechanics' arts; and the college of medicine. The department of law is not yet organized. It is governed by a board of 10 regents, 7 of whom are appointed for 3 years by the governor; the governor, the president of the university, and the superintendent of public instruction are members *ex officio*. Tuition is free to both sexes. There are 25 instructors, and the library contains about 15,000 vols. The present endowment is about $220,000, and will ultimately reach $1,000,000 by the sale of lands. The annual income is about $30,000. The state geological and natural history surveys are in charge of the faculty. President, Cyrus H. Northrop.

MINNETAREES, or HIDATSA, a tribe of Indians, originally part of the Crow tribe, but for nearly a century associated with the Mandans, and settled on the upper Missouri river. Their number is not more than 450 or 500, having gradually decreased for many years. Treaties have been made with them by the government and a reservation in Montana set apart for them, but they prefer to remain where they are, gaining their living entirely by hunting and fishing. Though friendly to the whites, they have had many wars with the Sioux and other tribes. A dictionary and grammar of the language has been printed.

MIN'NOW, *Leuciscus phoxinus*, a small fish of the same genus with the roach, dace, chub, etc., of a more rounded form than most of its congeners, a common native of streams with gravelly bottoms in most parts of Britain. It seldom exceeds three inches in length, the head and back of a dusky olive color, the sides lighter and mottled, the belly white, or, in summer, pink. Minnows swim in shoals, feed readily either on animal or vegetable substances, if sufficiently soft, and are said to be very destructive to the spawn of salmon and of trout. Very young anglers generally begin their sport by catching minnow. The minnow is a fish of very pleasant flavor. A casting-net affords the means of taking it in a sufficient abundance. It is a favorite bait for pike and large trout or perch.

MINO BIRD. See MINA BIRD, *ante*.

MINOR, a term used in music. 1. In the nomenclature of intervals. The interval between any note and another is named according to the number of degrees between them

ENGRAVED FOR THE AMERICAN UNIVERSAL CYCLOPÆDIA. COPYRIGHT, 1883, BY CHARLES M. GREEN.

on the scale, both notes included. The interval between C and E is called a third; that between E and G is also a third; but these intervals are unequal, the one consisting of four semitones, the other of three; the former is therefore distinguished as a major, the latter as a minor interval. 2. The term is also applied to one of the two modes in which a musical passage may be composed. The scale of the minor mode differs from that of the major mode in the third of its key-note being a minor instead of a major third. See MUSIC, MODE.

MINOR is, in Scotch law, the term describing a person who, if a male, is between the ages of 14 and 21; and if a female, is between 12 and 21. In the preceding period he or she is called a pupil. In England the technical term is an infant (q.v.), which includes all persons, male and female, under the age of 21. In Scotland a minor is for many purposes *sui juris*, and can marry without anybody's consent, and can also make a will of movable property. For the purposes, however, of managing his real property and making contracts, curators are often necessary. See INFANT, RESTITUTION, MAJORITY.

MINOR BARONS. The word baron, in the earliest period of feudalism, signified one who held lands of a superior by military tenure. The superior might be the sovereign, or he might be an earl or other eminent person, who held of the sovereign. According as he was the one or the other, the baron was, in the earliest sense of the distinction, a greater or lesser baron. At the conquest a large part of the soil of England was parceled by William the Norman among his military retainers, who were bound in return to perform services, to do homage, and to assist in administering justice, and in transacting the other business done in the court of the king. 400 of these tenants-in-chief of the crown are enumerated in Domesday (q.v.), including among them "vice-comites" and "comites," who together constituted the body of men called the barons of England. As the sovereign was entitled to demand from the barons military service, homage, and attendance in the courts, so, many of the principal barons, particularly such of them as were earls, had military tenants, from whom they in turn received homage and assistance in administering justice in their baronial courts. These tenants were barons of the barons, or, in the earliest sense, minor barons; but by the usage of England, from the conquest downwards, they were seldom called barons, that term having been generally restricted to the former class, the holders of land direct from the crown, who were next to the king in dignity, formed his army and his legislative assembly, and obtained the great charter from king John. The subinfeudation which produced the minor barons was checked by a statute of Edward I., directing that all persons acquiring lands from a subject should hold, not of that subject, but of his superior.

Out of the "commune concilium" of the king, at which all his barons were bound to attend, arose the parliament. It is not till the close of Henry III.'s or beginning of Edward I.'s reign that we find a select number instead of the whole barons attending. The exact period of the change, and the way in which it was made, are still among the obscure points of English history; it has been thought that after the rebellion which was crushed at the battle of Evesham, Henry III. summoned only those barons who were most devoted to his interest. From this period a new distinction between major and minor barons arose, the latter term being no longer applied to the barons of the barons, but to those barons of the crown who were no longer summoned by writ to parliament. The word baron was more and more used in the restricted sense of a baron of parliament, and the right or duty of attendance came in process of time to be founded, not on the tenure, but on the writ.

In Scotland the barons (or lairds) were such persons as held their lands directly of the crown. They were the king's advisers, witnessed his charters, and possessed a civil and criminal jurisdiction. All had to give attendance in the Scottish parliament, which consisted of the earls and barons sitting together. After the reign of James I. some of the more powerful barons appear more exclusively as lords of parliament, those whose incomes were below a certain amount obtaining a dispensation from attendance; yet all possessed a right to attend parliament till 1587, when the barons not specially created lords of parliament were required, in place of personally attending, to send representatives of their order from each sheriffdom. The term baron, however, still continued in Scotland to be applied to the whole body of tenants *in capite*, such of them as were lords of parliament being distinctively major, and the others minor barons; but all continuing up to 1747 to possess an extensive civil jurisdiction and a criminal jurisdiction, from which only treason and the four pleas of the crown were excluded. The representative minor barons sat in the same house with the major barons, and their votes continued down to the union to be recorded as those of the "small barrounis."

MINOR, ROBERT C. See page 881.

MINORCA, the largest of the Balearic isles (q.v.) after Majorca, from which it is distant 25 m. n.e. It is 31 m. long and 13 m. in greatest breadth, with an area of about 300 sq. miles. Pop. 37,262. Its coast, broken into numerous bays and inlets, is fringed with islets and shoals, and its surface, less mountainous than that of Majorca, is undulating, rising to its highest point in mount Toro, 4,793 feet above sea-level. Its productions are similar to those of the larger island, although it is neither so fertile in soil nor so well watered as Majorca. The chief towns are port Mahon (q.v.), and Ciudadela. The annual exports are worth £110,000; the imports £100,000.

MINORITES, a name of the Franciscan order (q.v.), derived from the original later denomination adopted by their founder, *Fratres Minores.* This name has left its trace in the popular designation of several localities both in English and foreign cities.

MI'NOS, the name of two mythological kings of Crete. The first is said to have been the son of Jupiter and Europa, the brother of Rhadamanthus, the father of Deucalion and Ariadne, and, after his death, a judge in the infernal regions. The second of the same name was grandson of the former, and son of Lycastus and Ida. To him the celebrated *Laws of Minos* are ascribed, in which he is said to have received instruction from Jupiter. He was the husband of that Pasiphaë who gave birth to the Minotaur (q.v). Homer and Hesiod know of only one Minos, the king of Cnossus, and son and friend of Jupiter.

MINOT, GEORGE, 1817–58; b. Mass.; read law in the office of Rufus Choate, and was admitted to the bar in 1839. He soon obtained a large practice in Boston. He reported the decisions of judge Levi Woodbury of the circuit court, and edited, in association with Richard Peters, jr., 8 vols. of the *U. S. Statutes at Large,* and was sole editor of that work from 1848 to 1858. He published in 1844 *A Digest of the Decisions of the Supreme Court of Massachusetts,* and edited, between 1853–54, the *English Admiralty Reports* in 9 vols.

MINOT, GEORGE RICHARDS, 1758–1802; b. Boston; educated at Harvard, and called to the bar. From 1781 to 1791 he was clerk of the Massachusetts house of representatives, and was secretary of the convention called to ratify the federal constitution. He continued the practice of his profession till 1792, when he was appointed judge of probate for Suffolk county. In 1799 he was made chief-justice of the court of common pleas, and from 1800 till his death he was judge of the municipal court of Boston. He published a *History of Shay's Rebellion,* 1788, and a *History of Massachusetts Bay,* 2 vols., 1798–1803. The latter work is in continuation of Hutchinson's.

MINOTAUR (i.e., the bull of Minos), one of the most repulsive conceptions of Grecian mythology, is represented as the son of Pasiphaë and a bull, for which she had conceived a passion. It was half-man half-bull, a man with a bull's head. Minos, the husband of Pasiphaë, shut him up in the Cnossian labyrinth, and there fed him with youths and maidens, whom Athens was obliged to supply as an annual tribute, till Theseus, with the help of Ariadne, slew the monster. The Minotaur is, with some probability, regarded as a symbol of the Phenician sun-god.

MINOT'S LEDGE, a light-house on a ledge of Cohasset rocks from which a fixed light is exhibited and a fog bell is rung. It is 16 m. from Boston, and 8 m. s.e. of Boston light, on the s. coast, a position of great peril to incoming vessels. It is indispensable, as without it, from the nature of the entrance to the harbor, in a n.e. gale vessels would with certainty be driven on the rocks if they failed to make the entrance. It is 1½ m. from land, and the rock on which it stands, 25 ft. in diameter, is visible only at low water, when the height is for a short time about 3½ ft. above the water line. In 1847 congress made an appropriation for the construction of a light-house at this point, called the Outer Minot, surmounted by a dwelling placed at the height of 55 ft. above the highest rock. A skeleton iron light-house was designed and erected by capt. W. H. Swift of the U. S. engineers at a cost of less than $40,000. It was formed of 8 heavy wrought iron piles, solid 10 in. skeleton shafts, with one additional in the center. The piles were each in 2 parts, connected by cast iron tubes 3 ft. long, the piles being secured to the tubes by large steel keys passing through the tubes and piles; and in its entire construction it was thought to be as secure as modern science could make it; but it stood only 2 years. On April 17, 1851, during one of the heaviest gales known on the coast, it was completely wrecked. A 5½ in. hawser, anchored to a block of granite in the sea 50 fathoms from the base of the light, was attached at the other end to the top of the structure 63 ft. above the rock used ordinarily for raising boxes, etc. The keeper had carelessly allowed some stores, that should have been below, to remain out on the scaffolding. This was supposed to be one cause of the disaster; and another was the quantity of ice that adhered to the piles. The money for the present structure was appropriated in 1852, and the plans were made in 1855, the success of the enterprise being due to the late chief engineer gen. J. G. Totten, his plans being executed by gen. Barton S. Alexander. It is of conical form 30 ft. at the base, built of granite, the height of the stone work being 88 ft., solid for 40 ft. from the base, the stones dovetailed, and bound together by galvanized wrought iron pins 3 in. in diameter. The portion above this solid work is divided into the apartments of the keeper, 5 stories, with 4 iron floors, his store rooms, and the light on the 6th floor. Two years were required to level the foundation rock, working from April 1 to Sept. 15, and then only when the tide served. The first stone was laid on July 9, 1857; 4 stones were placed in position during the season. In 1858 six courses were laid; the following year the structure reached a height of 60 ft.; and in 1860 it was completed at a cost of about $300,000, and the beacon was lighted.

MINSIS INDIANS. See MUNSEES.

MINSK, a government and province of western or White Russia, lies s.e. of Wilna, and contains 34,860 sq.m., with a population (1880) of 1,451,950, composed chiefly of Russians, Lithuanians, Poles, and Jews, with a small percentage of Tartars and gypsies.

Five-sevenths of the population profess the Greek religion. The chief articles of export are timber, salt, and corn, which are brought by river-carriage to the Baltic and Black sea ports. The principal manufactures are fine cloths, linen, and sugar. The soil is not fertile, and is covered to a large extent with woods and marshes, while in many other places it is a sandy waste; but in general the native products suffice for the wants of the inhabitants. The climate is very severe in winter. Cattle and sheep breeding are pursued with tolerable success. The inhabitants of the south or marshy portion of the province are subject to that dreadful disease, the *plica polonica* (q.v.).

MINSK, the chief t. of the government of the same name, is situated on the Svislocz, an affluent of the Beresina. It is mostly built of wood, but has many handsome stone edifices, among which are the Greek and Roman Catholic cathedrals and seminaries, the church of St. Catharine, a number of educational and philanthropic establishments, a public library, and a theater. The chief manufactures are woolen cloth and leather. Pop. '80, 44,000, many of whom are Jews.

MINSTER. See MONASTERY.

MINSTREL, a musician of the middle ages who was also a poet and singer: the term is applied to a class of persons who were to administer their skill in poetry and music for the amusement of their patrons. The various ways in which the word was written have perplexed the etymology. It appears, however, to have been no more than a consequential usage of the French *ministre* and the Latin *ministri*. They are in low Latin sometimes called plainly ministri; by Chaucer, in his *Dream*, "ministers," and in the old paper roll printed by Leland we find "ministers" who were appointed "to syng." The minstrels appear to have accompanied their songs with mimicry and action, and to have practiced such various means of diverting as were most admired in those rude times, and supplied the want of more refined entertainment. These arts rendered them extremely popular and acceptable in England and all the neighboring countries, where no high scene of festivity was considered complete that was not set off with the exercise of their talents, and where, so long as the spirit of chivalry subsisted, they were protected and caressed, because their songs tended to honor the ruling passion of the times, and to encourage a martial spirit. The minstrels seem to have been the genuine successors of the ancient bards, who, under different names, were admired and revered, from the earliest ages, among the people of Gaul, Britain, and, indeed, through almost all Europe, whether Celtic or Gothic; but by none more than by the early Germans, particularly by the Danish tribes. Among these they were distinguished by the name of sealds, a word which denotes "smoothers and polishers of language." Their skill was considered as something divine, their persons were deemed sacred, their attendance was solicited by kings, and they were everywhere loaded with honors and rewards. When the Saxons were converted to Christianity this rude admiration began to subside, and poets were no longer considered a peculiar class or profession. The poet and the minstrel became two persons. Poetry was cultivated by men of letters indiscriminately, and many of the most popular rhymes were composed amidst the leisure and retirement of monasteries. But the minstrels continued to be a distinct order of men, and obtained their livelihood by singing verses to the harp at the houses of the great There they were hospitably received. and retained many of the honors conferred upon the bards and the scalds. Although some of them only recited the compositions of others, many of them still composed songs, and all of them could probably invent a few stanzas upon occasion. Some of the longer metrical romances were written by monks, but the shorter narratives were probably composed by the minstrels who sung them, and there is no doubt that most of the old heroic ballads were produced by this order of men From the striking variations which occur in different copies of these old pieces it is evident that they made no scruple to alter one another's productions; and the reciter added or omitted whole stanzas, according to his own fancy or convenience. In England the profession of minstrel was a popular and privileged one from the time of the conquest, but this entertaining class never met with so much royal patronage as during the reign of Richard I. This brilliant crusader, himself an adept in the minstrel's art, invited to his court many minstrels and troubadours from France, and loaded them with honors and rewards such as arms, clothes, horses, and money. The well-known story of Richard's favorite minstrel, Blondell de Nesle, discovering his royal master by singing a French chanson under the walls of a German castle in which he was a prisoner, has never been authenticated but it presents a popular illustration of the traditional devotion of the royal minstrel to his art. The instances of regard shown to minstrels during subsequent reigns are abundant. Edward II. rewarded his minstrel William de Morle, known as "Roi de North," with certain houses which had previously belonged to the degraded minstrel John de Boteler, called "Roi Brunard." We also find from Rymer that in 1415, when Henry V. was on his voyage to France, he was accompanied by eighteen minstrels, who were to receive twelve pence a day. Indeed, the minstrels were often in those days more amply paid than the clergy. From the time of Edward IV., however, the real character of the original minstrels was gradually lost; and they were seldom called upon to furnish a specimen of their venerable art except when some great personage condescended on a public occasion to patronize the rude pastimes of his ancestors. The genuine minstrel was seldom to be found in England, and the name had become so far

degraded as popularly to denote a mere musician. It is true that at the magnificent entertainment of queen Elizabeth by Leicester, at Kenilworth castle, in 1575, a person was introduced to amuse the queen, in the attire of an ancient minstrel, who called himself "a squire minstrel of Middlesex," but this was no doubt a part of the masquerade. Before Elizabeth closed her reign the degradation of minstrelsy was completed. By a statute in her 39th year, minstrels, together with jugglers, bear-wards, fencers, common players of interludes, tinkers, and peddlers, were included among rogues, vagabonds, and sturdy beggars, and were adjudged to be punished as such.

MINT, *Mentha*, a genus of plants, of the natural order *labiatæ;* with small, funnel-shaped, 4-fid, generally red corolla, and four straight stamens. The species are perennial herbaceous plants, varying considerably in appearance, but all with creeping root-stocks. The flowers are whorled, the whorls often grouped in spikes or heads. The species are widely distributed over the world. Some of them are very common in Britain, as WATER MINT (*M. aquatica*), which grow in wet grounds and ditches, and CORN MINT (*M. arvensis*), which abounds as a weed in cornfields and gardens. These and most of the other species have erect stems. All the species contain an aromatic essential oil, in virtue of which they are more or less medicinal. The most important species are SPEARMINT, PEPPERMINT, and PENNY-ROYAL.—SPEARMINT or GREEN MINT (*M. viridis*), is a native of almost all the temperate parts of the globe: it has erect smooth stems, from 1 ft. to 2 ft. high, with the whorls of flowers in loose cylindrical or oblong spikes at the top; the leaves lanceolate, acute, smooth, serrated, destitute of stalk, or nearly so. It has a very agreeable odor.—PEPPERMINT (*M. piperita*), a plant of equally wide distribution in the temperate parts of the world, is very similar to spearmint, but has the leaves stalked, and the flowers in short spikes, the lower whorls somewhat distant from the rest. It is very readily recognized by the peculiar pungency of its odor and of its taste.—PENNY-ROYAL (*M. pulegium*), also very cosmopolitan, has a much-branched prostrate stem, which sends down new roots as it extends in length; the leaves ovate, stalked; the flowers in distant globose whorls. Its smell resembles that of the other mints.—All these species, in a wild state, grow in ditches or wet places. All of them are cultivated in gardens; and peppermint largely for medicinal use and for flavoring lozenges. *Mint sauce* is generally made of spearmint; which is also used for flavoring soups, etc. A kind of mint with lemon-scented leaves, called BERGAMOT MINT (*M. citrata*), is found in some parts of Europe, and is cultivated in gardens. Varieties of peppermint and horse-mint (*M. sylvestris*), with *crisped* or inflato-rugose leaves, are much cultivated in Germany under the name of CURLED MINT (*Krause-minze*); the leaves being dried and used as a domestic medicine, and in poultices and baths. All kinds of mint are easily propagated by parting the roots or by cuttings. It is said that mice have a great aversion to mint, and that a few leaves of it will keep them at a distance.

Peppermint, penny-royal, and spearmint are used in medicine. The pharmacopœias contain an *aqua, spiritus,* and *oleum* of each of them; the officinal part being the herb, which should be collected when in flower. *Peppermint* is a powerful diffusible stimulant, and, as such, is antispasmodic and stomachic, and is much employed in the treatment of gastrodynia and flatulent colic. It is also extensively used in mixtures, for covering the taste of drugs. *Penny-royal* and *spearmint* are similar in their action, but inferior for all purposes to peppermint. The ordinary doses are from 1 to 2 ounces of the *aqua*, a dram of the *spiritus* (in a wine-glassful of water), and from 3 to 5 drops of the *oleum* (on a lump of sugar).

MINT (Lat. *moneta*), an establishment for making coins or metallic money (see MONEY). The early history of the art being traced under the head NUMISMATICS, the present article is mostly confined to a sketch of the constitution of the British mint, and of the modern processes of coining as there followed.

The earliest regulations regarding the English mint belong to Anglo-Saxon times. An officer called a reeve is referred to in the laws of Canute as having some jurisdiction over it, and certain names which, in addition to that of the sovereign, appear on the Anglo-Saxon coins, seem to have been those of the moneyers, or principal officers of the mint, till recently, an important class of functionaries, who were responsible for the integrity of the coin. Besides the sovereign, barons, bishops, and the greater monasteries had their respective mints, where they exercised the right of coinage, a privilege enjoyed by the archbishops of Canterbury as late as the reign of Henry VIII., and by Wolsey as bishop of Durham and archbishop of York.

After the Norman conquest, the officers of the royal mint became to a certain extent subject to the authority of the exchequer. Both in Saxon and Norman times, there existed, under control of the principal mint in London, a number of provincial mints in different towns of England; there were no fewer than 38 in the time of Ethelred, and the last of them were only done away with in the reign of William III. The officers of the mint were formed into a corporation by a charter of Edward II.; they consisted of the warden, master, comptroller, assay-master, workers, coiners, and subordinates.

The seignorage for coining at one time formed no inconsiderable item in the revenues of the crown. It was a deduction made from the bullion coined, and comprehended both a charge for defraying the expense of coinage, and the sovereign's profit in virtue of his prerogative. In the reign of Henry VI., the seignorage amounted to 6d. in

the pound: in the reign of Edward I., 1s. 2½d. By 18 Car. II. c. 5, the seignorage on gold was abolished, and has never since been exacted. The shere, or remedy, as it is now called, was an allowance for the unavoidable imperfection of the coin.

The function of the mint is in theory to receive gold in ingots from individuals and return an equal weight in sovereigns; but, in point of fact, gold is now exclusively coined for the bank of England, for, though any one has still the right to coin gold at the mint, the merchant or dealer has ceased to obtain any profit for so doing, as the bank is compelled to purchase all gold tendered to it at the fixed price of £3 17s. 9d. an ounce. The increment on the assay (q.v.), or on the fineness of the metal, which augments the standard weight, and therefore the value of the gold, is a more considerable source of profit to the importer of gold. The ordinary trade assay, on which the importer purchases the bullion, does not, by usage, come closer than $\frac{1}{8}$ of a carat grain, or $7\frac{1}{2}$ grains per lb. troy. Before being coined the gold is subjected to a second and more delicate assay at the mint, and the importer receives the benefit of the difference, amounting to about $\frac{1}{16}$ of a carat grain = $3\frac{3}{4}$ troy grains, or nearly 8d. per lb. weight.

Silver, which was formerly, concurrently with gold, a legal tender to any amount, has, by 56 George III. c. 68, ceased to be so. There is a seignorage on both silver and copper money, amounting in silver to 10 per cent. when the price of silver is 5s. per ounce, which, however, from the tear and wear of the coin, brings small profit to the crown. On the copper coinage the seignorage is no less than 100 per cent on the average price of copper. The profits of the seignorage, formerly retained by the master of the mint to defray the expense of coinage, have, since 1837, been paid into the bank to the credit of the consolidated fund.

A new mint was erected on Towerhill in 1810. In 1815 some alterations were made in its constitution; and in 1851 a complete change was introduced in the whole system of administration. The control of the mint was vested in a master and a deputy master, and comptroller. The mastership, which had in the early part of the present century become a political appointment held by an adherent of the government, was restored to the position of a permanent office, the master being the ostensible executive head of the establishment. The operative department was intrusted to the assayer, the melter, and the refiner. The moneyers, who had from early times enjoyed extensive privileges and exemptions, and were contractors with the crown for the execution of the coinage, were abolished, and the contracts with the crown were entered into by the master of the mint, who also made subordinate contracts for the actual manufacture of the coin. Further changes were made on the administration of the mint in 1869. The mastership was added to the duties of the chancellor of the exchequer, without any addition of salary, and the offices of deputy master and comptroller were amalgamated. A yearly saving of £10,000 is believed to have been effected by the changes of 1851, and a further £8,000 by those of 1869, with an increase of efficiency. It is at present in contemplation to remove the mint from Towerhill to the rear of the Thames embankment at Whitefriars, with new and improved machinery. Mints have lately been established at Sydney and Melbourne to coin the gold so largely found in Australia.

Processes of Coining.—Down to the middle of the 16th c. little or no improvement seems to have been made in the art of coining from the time of its invention. The metal was simply hammered into slips, which were afterwards cut up into squares of one size, and then forged round. The required impression was given to these by placing them in turn between two dies and striking them with a hammer. As it was not easy by this method to place the dies exactly above each other, or to apply proper force, coins so made were always faulty, and had the edges unfinished, which rendered them liable to be clipped. The first great step was the application of the screw, invented in 1553 by a French engraver of the name of Brucher. The plan was found expensive at first, and it was not till 1662 that it altogether superseded the hammer in the English mint. The chief steps in coining as now practiced are as follows: The gold or silver to be coined is sent to the mint in the form of *ingots* (Ger. *eingiessen*, Du. *ingieten*, to pour in, to cast), or castings; those of gold weighing each about 180 oz., while the silver ingots are much larger. Before melting, each ingot is tested as to its purity by assaying (q.v.), and then weighed, and the results carefully recorded. For melting the gold, pots or crucibles of plumbago are used, made to contain each about 1200 oz. The pots being heated white in furnaces, the charge of gold is introduced along with the proper amount of copper (depending upon the state of purity of the gold as ascertained by the assay), to bring it to the standard, which is 22 parts of pure gold to 2 of copper (see ALLOY). The metal when melted is poured into iron molds, which form it into bars 21 in. long, $1\frac{1}{4}$ in. broad, and 1 in. thick, if for sovereigns; and somewhat narrower if for half-sovereigns. For melting silver (the alloy of which is adjusted to the standard of 222 parts of silver to 18 of copper), malleable iron pots are used, and the metal is cast into bars similar to those of gold.

The new copper, or rather bronze coinage, issued in 1860, is an alloy consisting of 95 parts of copper, 4 of tin, and 1 of zinc. The coins are only about half the weight of their old copper representatives. The processes of casting and coining the bronze are essentially the same as in the case of gold and silver.

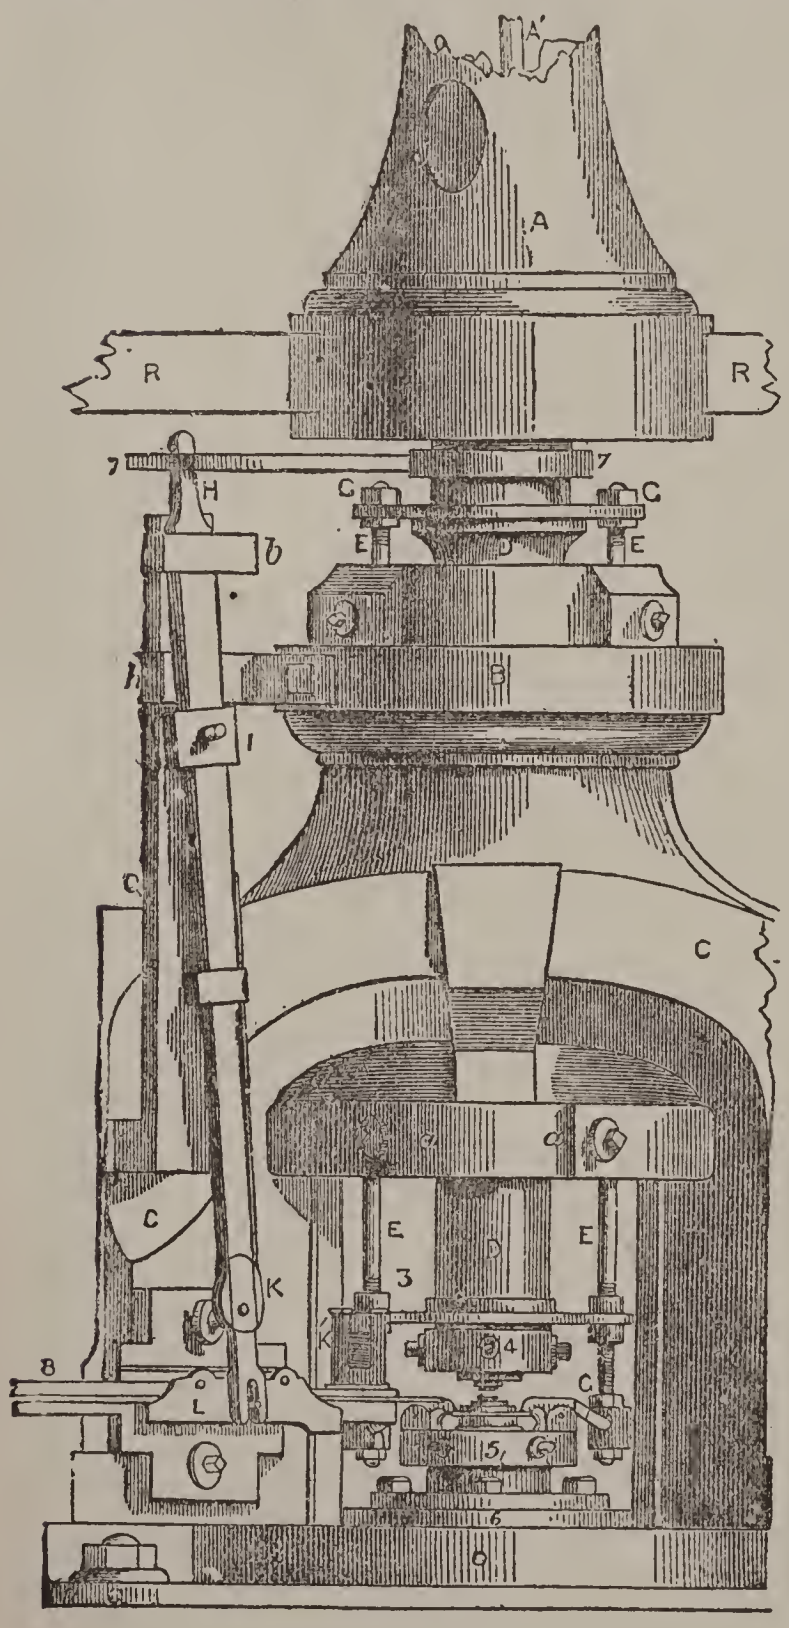
The operation of *rolling* follows that of casting. It consists in repeatedly passing the bars between pairs of rollers with hardened steel surfaces, driven by steam power; the

rollers being brought closer and closer as the thickness becomes reduced. At a certain stage, as the bars become longer, they are cut into several lengths; and to remove the hardness induced by the pressure they are annealed. The finishing rollers are so exquisitely adjusted that the *fillets* (as the thinned bars are called) do not vary in thickness in any part more than the ten-thousandth part of an inch. The slips are still further reduced in the British mint at what is called the "draw bench," where they are drawn between steel dies, as in wire-drawing, and are then exactly of the necessary thickness for the coin intended.

The fillets thus prepared are passed to the tryer, who, with a hand-punch, cuts a trial-blank from each, and weighs it in a balance; and if it vary more than $\frac{1}{8}$th of a grain, the whole fillet is rejected.

For cutting out the *blanks* of which the coins are to be made, there are in the British mint 12 presses arranged in a circle, so that one wheel with driving cams, placed in the center, works the whole. The punches descend by pneumatic pressure, and the fillets are fed into the presses by boys, each punch cutting out about 60 blanks a minute. The scrap left after the blanks are cut out, called *scissel*, is sent back to be remelted.

Each blank is afterwards weighed by the automaton balance—a beautiful and most accurate instrument, which was added to the mint about 20 years ago. It weighs 23 blanks per minute, and each to the 0.01 of a grain. The standard weight of a sovereign is 123.274 grains, but the mint can issue them above or below this to the extent of 0.2568 of a grain, which is called *the remedy*. Blanks which come within this limit are dropped by the machine into a "medium" box, and pass on to be coined. Those below the required weight are pushed into another box to be remelted, but those above it into another, and are reduced by filing. The correct blanks are afterwards rung on a sounding iron, and those which do not give a clear sound are rejected as dumb.



Coining-Press.

To insure their being properly milled on the edge, the blanks are pressed edgeways in a machine between two circular steel-plates, which raises the edges, and at the same time secures their being perfectly round. After this they are annealed to soften them, before they can be struck with dies; they are also put into a boiling pot of dilute sulphuric acid, to remove any oxide of copper from the surface. Subsequently they are washed with water, and dried with great care in hot sawdust, and finally in an oven at a temperature slightly above boiling water. Without these precautions, the beautiful bloom upon new coin could not be secured.

We now come to the press room, where the blanks receive the impression which makes them perfect coins. The coining press is shown in the fig., and there are eight of them in all, ranged in a row upon a strong foundation of masonry. CCB is the massive iron frame into which the screw D works, the upper part B being perforated to receive it. On the bottom of this screw the upper steel die is fixed by a box, the lower die being fixed in another box attached to the base of the press. The dies have, of course, the obverse and reverse of the coin upon them. See DIE SINKING. The blank coin is placed on the lower die, and receives the impression when the screw is turned round so as to press the two dies forcibly towards each other. A steel ring or collar contains the coin while it is being stamped, which preserves its circular form, and also effects the milling on the edge. In cases where letters are put on the edge of

a coin, a collar divided into segments working in center-pins, is used. On the proper pressure being applied, the segments close round, and impress the letters on the edge of the coin.

The screw of the press is put in motion by means of the piece A, which is worked by machinery driven by steam-power, and situated in an apartment above the coining-room. The steam-engine exhausts an air-chamber, and from the vacuum produced, an air-engine works a series of air-pumps, which communicate a more exact and regular motion to the machinery of the stamping presses than by the ordinary condensing engine. The loaded arms RR strike against blocks of wood, whereby they are prevented from moving too far, and run the risk of breaking the hard steel dies by bringing them in contact. The press brings down the die on the coin with a twisting motion, but if it were to rise up in the same way, it would abrade the coin; there is, in consequence, an arrangement which, by means of a wide notch in the ring 3, allows the die to be raised up a certain distance before it begins to turn round with the screw.

On the left side of the figure, the arrangement for feeding the blanks and removing the coins as they are stamped, is shown. A lever HIK, moving on a fulcrum I, is supported by a bar Q, fixed to the side of the press. The top of this lever is guided by a sector, 7, fixed upon the screw D. In this sector there is a spiral groove, which, as the screw turns round, moves the end H of the lever to or from the screw, the other end K being moved at the same time either towards or away from the center of the press. The lower end of the lever moves a slider L, which is directed exactly to the center of the press, and on a level with the upper surface of the die. The slider is a thin steel-plate in two pieces united by a joint, and having a circular cavity at the end, which, when its limbs are shut, grasps a piece of coin by the edge. This piece drops out on the limbs separating. There is a tube at K which an attendant keeps filled with blank pieces; it is open at the bottom, so that the pieces rest on the slider. When the press is screwed down, the slider is drawn back to its furthest extent, and its circular end comes exactly beneath the tube. A blank piece of coin now drops in, and is carried, when the screw rises, to the collar which fits over the lower die. The slider then returns for another blank, while the upper die descends to give the impression to the coin. Each time the slider brings a new blank to the die, it at the same time pushes off the piece last struck. An arrangement of springs lifts the milled collar to inclose the coin while it is being struck.

It is found on examining the coins that about 1 in 200 is imperfectly finished; these being rejected, the rest are finally weighed into bags, and subjected to the process of *pyxing*. This consists in taking from each bag a certain number of sovereigns or other coins, and subjecting them to a final examination by weight and assay, before they are delivered to the public.

MINT (*ante*). The first U. S. mint was established at Philadelphia by the coinage act of April 2, 1792; and the first production of the new mint was the copper cent of 1793. Silver dollars were first coined in 1794 and gold eagles in 1795. Branches of the Philadelphia mint were organized at New Orleans, Dahlonega, Ga., and Charlotte, N. C., in 1835; at San Francisco, Cal., in 1854, and at Carson City, Nev., in 1870. Those at New Orleans, Dahlonega, and Charlotte have been given up. Assay offices were set up at New York in 1854, at Denver in 1864, and Boise City, Idaho, in 1872. The act of April 1, 1873, put all the mints and assay offices on the same footing as a bureau of the treasury department, under the superintendence of the director of the mint, who is appointed by the president for a term of 5 years, and is under the supervision of the secretary of the treasury. The director of the Philadelphia mint, who had hitherto been called director of the mint, was now known as superintendent of the Philadelphia mint. Every mint has a superintendent, melter and refiner, assayer, and coiner, and the Philadelphia mint has an engraver, who supervises the manufacture of the dies used in all the U. S. mints. The total production of the mints for 1884 was: gold coin, $27,932,824.00; silver, $28,773,387.80; minor coins, $1,174,709.73. The director of the mint in 1885 was Horatio C. Burchard, of Illinois.

MINTO, Gilbert Elliot, Earl of, 1751–1814; entered the British parliament as a whig in 1774. He was minister to Denmark from 1788 to 1794, then went to Corsica as viceroy. On his return in 1797 he was created baron Minto, and two years later he became ambassador to Vienna. On his reappearance in the house of lords he became an advocate of the union of Ireland with England, and afterwards strenuously opposed Roman Catholic emancipation. He was governor-general of Bengal from 1807 to 1813, and in the latter year received the titles of earl Minto, viscount Melgund.

MINTURN, Robert Bowne, 1805–66; b. N. Y.; entered mercantile life at an early age in New York city, and became eventually a partner in the well known shipping house of Grinnell, Minturn & Co., in which he accumulated a large fortune. He was chiefly noted as an active promoter of the city's charities; as one of the founders of St. Luke's hospital; for patriotic service during a visit to Europe in 1861; and as an earnest worker in behalf of the freedmen. At the time of his death he was president of the Union League club of New York.

MINU'CIUS, Felix Marcus, an eminent apologist of the Latin church in the 3d century. He was a native of Africa, but removed to Rome, where he was a successful advocate until his conversion to Christianity. Jerome and Lactantius speak of him as much admired for his eloquence. He wrote a work entitled *Octavius* in the form of a dialogue between a Christian called Octavius and a heathen called Cæcilius. Octavius defends the Christians from the calumnies which were circulated against them, charging them with crimes in their secret religious meetings. He, on the other hand, exposes the licentious practices of the heathen. The style of the work is argumentative and pure, and much information is given concerning the manners. customs, and opinions of that period. As an apology for Christianity his work compares favorably with those of Justin, Tertullian, and other early advocates of the Christian faith, and with those of Lactantius, Ambrose, and Eusebius of the 4th century. It was at one time ascribed to Arnobius as a part of his treatise *Adversus Gentes;* but Baldwin in a *Dissertation on Minucius*, shows that Minucius was the author. It has passed through many editions at Leyden and Cambridge, Eng., the latter containing numerous notes by Dr. Davis, and a dissertation or commentary by Baldwin. It has been translated also into French and German.

MINUET, the air of a most graceful dance, originally from Poitou, in France. It is performed in a slow tempo. The first minuet is said to have been composed by Lully the elder, and was danced by Louis XIV. in 1653 at Versailles with his mistress. The music of the minuet is in $\frac{3}{4}$ time, and is still well known in England by the celebrated *minuet de la cour*, which is frequently introduced in stage performances.

MINUIT, MINUITS, or MINNEWIT, Peter, 1580–1641; b. Germany; a deacon in the Protestant or Walloon church in Wesel, who removed to Holland early in the 17th c., and after a residence there of some years received from the Dutch West India company the appointment of governor and director-general of New Netherland. He reached the seat of his government, Manhattan island, May 4, 1626, and proceeded to establish in permanency his tenure and that of the company by purchasing the island from the Indians, obtaining it for the sum of sixty guilders, about 24 dollars. He built fort Amsterdam, and defended the claim of the Dutch to rightful possession of the island with great courage and determination, while he administered the affairs of his office judiciously and to the general satisfaction of the colony, which advanced in power and prosperity. The fact that the patroons were successful in establishing titles to enormous tracts of land became objectionable to the Dutch West India company, who recognized the introduction of abuses in this course and placed the responsibility on the shoulders of gov. Minuit. In 1631 he was accordingly recalled by the company, and sailed for Holland in the following spring, but was driven into Plymouth, Eng., by a gale. Here a charge was set up against him of having prosecuted illegal trading within English dominions, and his vessel was attached on complaint made by the New England council. It required a protest from the ambassador of Holland in London to obtain the release of the vessel, and the discharge of the complaint; and this was not effected until the latter part of May. Minuit now made every effort to re-establish himself in the favor of the Dutch West India company, but without success, and at length offered his services to the government of Sweden for colonizing purposes. His proposition was favorably considered by the celebrated Oxenstiern, who was then chancellor, and through his influence a Swedish West India company was organized, and Minuit was commissioned by the queen to establish a Swedish colony in America. He accordingly gathered together sufficient Swedes and Finns for this purpose, and sailed for the port of Gothenburg, Sweden, in 1637, bound for the w. coast of Delaware bay, which point had been selected for the site of the new colony. He arrived in Chesapeake bay in the spring of 1638, and built fort Christiana, near where the city of Wilmington, Del., now stands. The Swedish colonization scheme was bitterly opposed by the Dutch, who threw every possible obstacle in the way of its success, and eventually captured the colony and annexed it to their possessions in 1655. But while it was under the direction of Minuit, during which time it was called New Sweden, the Dutch were unable to accomplish its absorption. Minuit died at fort Christiana.

MINUTE, a rough draft of any proceeding or instrument; so called from being taken down shortly and in *minute* or small writing, to be afterwards engrossed. See Engross. —Minute, in law, is a memorandum or record of some act of a court or of parties; in the latter sense, it is used chiefly in Scotland, as in the case of minute of agreement, minute of sale, etc.

MINUTE, the 60th part of an hour; also the 60th part of a degree of a circle. See Sexagesimal Arithmetic.—Minute, in architecture, is the 60th part of the diameter of the shaft of a classic column, measured at the base. It is used as a measure to determine the proportions of the order.

MI'OCENE (Gr. less recent), a term introduced by Lyell to characterize the middle tertiary strata, which he supposes to contain a smaller proportion of recent species of mollusca than the newer pliocene. and more than the older eocene. He estimates the proportion of living to fossil species in the miocene at 25 per cent.

Strata of this age occur in Britain in two limited and far separated localities—in the

island of Mull, and at Dartmoor in the s.e. of England. In this last district, they exist at Bovey Tracey, in a flat area of 10 m. long by 2 m. broad, and consist of clay interstratified with beds of imperfect lignites. Pengelly and Heer have recently examined the strata of this small basin, and have found that all the plants are of miocene age, and belong to the same species as those found in similar deposits, not only on the continent, but in Iceland, Greenland, and Arctic America. Their *facies* indicates a warmer climate than the present, and the geographical range of the species is unexampled in the existing flora. The Mull beds are situated at the headland of Ardtun, and consist of interstratified basalts, ashes, and lignites. There are three leaf-beds, varying in thickness from 1½ to 2½ ft., separated by two beds of ash, the whole resting on and covered by strata of basalt. The whole thickness is 131 feet. It is supposed that the leaf-beds were deposited in a shallow lake or marsh, in the vicinity of an active volcano. One of the beds consists of a mass of compressed leaves without stems, and accompanied with abundant remains of an equisetum, which grew in the marsh into which the leaves were blown. The leaves belong to dicotyledons and coniferæ, and are of species similar to those of Bovey Tracey.

The Fahluns of France are of this age, as are also part of the Mollassi of Switzerland, and the Mayence and Vienna basins. Of the same period are the highly fossiliferous deposits in the Sewalik hills, India, containing the remains of several elephants, a mammoth, hippopotamus, giraffe, and large ostrich, besides several carnivora, monkeys, and crocodiles, and a large tortoise, whose shell measured 20 ft. across. The European beds contain the remains of the dinotherium (q.v.).

MIOHIPPUS. See Horse, Fossil.

MIÖSEN, a lake in Norway, 36 m. n.e. of the city of Christiania, from which it may be reached by railroad. It is formed by the Lougen river, which empties into the lake at the little village of Lillehammer, and is 56 m. long and 12 m. in its greatest width. The scenery is very picturesque, and, as the climate of that part of Norway is most invigorating, the vicinity of the lake is very popular as a summer resort.

MIRABEAU, Honoré Gabriel Riquetti, Comte de, was b. Mar. 9, 1749, at Bignon, near Nemours. He was descended, by his own account, from the ancient Florentine family of Arrighetti, who, being expelled from their native city in 1268, on account of Ghibelline politics, settled in Provence. Jean de Riquetti or Arrighetti purchased the estate of Mirabeau in 1562; his grandson, Thomas, happened to entertain here, in 1660, Louis XIV. and cardinal Mazarin, on which occasion he received from the monarch the title of marquis Victor Riquetti. Marquis de Mirabeau (b. 1715, d. 1789), the father of Honoré, was a vain and foolish man, wasted his patrimony, wrote books of philanthropy and philosophy, as *L'Ami des Hommes* (5 vols. Par. 1755), and was a cruel tyrant in his own house. He procured no fewer than 54 *lettres de cachet* at different times against his wife and his children. Honoré, his eldest son, was endowed with an athletic frame and extraordinary mental abilities, but was of a fiery temper, and disposed to every kind of excess. He became a lieut. in a cavalry regiment; but continued to prosecute various branches of study with great eagerness, whilst outrunning his companions in a career of vice. An intrigue with the youthful wife of an aged marquis brought him into danger, and he fled with her to Switzerland, and thence to Holland, where he subsisted by his pen, amongst other productions of which his *Essai sur le Despotisme* attracted great attention. Meanwhile, sentence of death was pronounced against him; and the French minister, at his father's instigation, demanding that he should be delivered up to justice, he and his paramour were apprehended at Amsterdam, and he was brought to the dungeon at Vincennes, and there closely imprisoned for 42 months. During this time he was often in great want, but employed himself in literary labors, writing an *Essai sur les Lettres de Cachet et les Prisons d'état*, which was published at Hamburg (2 vols. 1782), and a number of obscene tales, by which he disgraced his genius, although their sale supplied his necessities. After his liberation from prison, he subsisted chiefly by literary labor, and still led a very profligate life. He wrote many effective political pamphlets, particularly against the financial administration of Calonne, receiving pecuniary assistance, it was said, from some of the great bankers of Paris; and became one of the leaders of the liberal party. When the states-general were convened, he sought to be elected as a representative of the nobles of Provence, but was rejected by them on the ground of his want of property; and left them with the threat that, like Marius, he would overthrow the aristocracy. He purchased a draper's shop, offered himself as a candidate to the third estate, and was enthusiastically returned both at Aix and Marseilles. He chose to represent Marseilles, and by his talents and admirable oratorical powers soon acquired great influence in the states-general and national assembly. Barnave well characterized him as "the Shakespeare of eloquence." He stood forth as the opponent of the court and of the aristocracy, but regarded the country as by no means ripe for the extreme changes proposed by political theorists, and labored, not for the overthrow of the monarchy, but for the abolition of despotism, and the establishment of a constitutional throne. To suppress insurrection he effected, on July 8, 1789, the institution of the national guard. In some of the contests which followed, he sacrificed his popularity to maintain the throne. The more that anarchy and revolutionary frenzy prevailed, the more decided did he become in his resistance to their prog-

ress; but it was not easy to maintain the cause of constitutional liberty at once against the supporters of the ancient despotism and the extreme revolutionists. The king and his friends were long unwilling to enter into any relations with one so disreputable, but at last, under the pressure of necessity, it was resolved that Mirabeau should be invited to become minister. No sooner was this known than a combination of the most opposite parties, by a decree of Nov. 7, 1789, forbade the appointment of a deputy as minister. From this time forth Mirabeau strove in vain in favor of the most indispensable prerogatives of the crown, and in so doing exposed himself to popular indignation. He still continued the struggle, however, with wonderful ability, and sought to reconcile the court and the revolution. In Dec., 1790, he was elected president of the club of the Jacobins, and in Feb., 1791, of the national assembly. Both in the club and in the assembly he displayed great boldness and energy; but soon after his appointment as president of the latter, he sank into a state of bodily and mental weakness, consequent upon his great exertions and his continued debaucheries, and died April 2, 1791. He was interred with great pomp in the church of St. Genevieve, the "Pantheon;" but his body was afterwards removed to make room for that of Marat. A complete edition of his works was published at Paris in 9 vols. in 1825–27. His natural son, Lucas Montigny, published *Mémoires Biographiques, Littéraires et Politiques de Mirabeau* (2d edit. 8 vols. Par. 1841), the most complete account which we have of his life. See also Carlyle's sketch of Mirabeau in his *Miscellaneous Essays* and his *French Revolution*.

MIRACLE, a term commonly applied to certain marvelous works (healing the sick, raising the dead, changing of water into wine, etc.), ascribed in the Bible to some of the ancient prophets, and to Jesus Christ, and one or two of his followers. It signifies simply that which is wonderful—a thing or a deed to be wondered at, being derived directly from the Latin *miraculum*, a thing unusual—an object of wonder or surprise. The same meaning is the governing idea in the term applied in the New Testament to the Christian miracles, *teras*, a marvel, a portent; besides which, we also find them designated *dunamenis*, powers, with a reference to the power residing in the miracle-worker; and *sēmeia*, signs, with a reference to the character or pretensions of which they were assumed to be the witnesses or guarantees. Under these different names, the one fact recognized is a deed done by a man, and acknowledged by the common judgment of men to exceed man's ordinary powers; in other words, a deed *supernatural*, above or beyond the common powers of nature, as these are understood by men.

In the older speculations on the subject, a miracle was generally defined to be a violation or suspension of the order of nature. While, on the one hand, it was argued (as by Hume) that such a violation or suspension was absolutely impossible and incredible; it was maintained, on the other, that the Almighty, either by his own immediate agency, or by the agency of others, could interfere with the operation of the laws of nature, in order to secure certain ends, which, without that interference, could not have been secured, and that there was nothing incredible in the idea of a law being suspended by the person by whom it had been made. The laws of nature and the will or providence of God were, in this view, thus placed in a certain aspect of opposition to each other, at points here and there clashing, and the stronger arbitrarily asserting its superiority. Such a view has, with the advance of philosophical opinion, appeared to many to be inadequate as a theory, and to give an unworthy conception of the divine character. The great principle of law, as the highest conception not only of nature but of divine Providence, in all its manifestations, has asserted itself more dominantly in the realm of thought, and led to the rejection of the apparently conflicting idea of "interference" implied in the old notion of miracle. Order in nature, and a just and uncapricious will in God, were felt to be first and absolutely necessary principles. The idea of miracle, accordingly, which seems to be now most readily accepted by the advocates of the Christian religion, has its root in this recognized necessity.

All law is regarded as the expression, not of a lifeless force, but of a perfectly wise and just will. All law must develop itself through natural phenomena; but it is not identified with or bound down to any necessary series of these. If we admit the mainspring of the universe to be a living will, then we may admit that the phenomena through which that will, acting in the form of law, expresses itself, may vary without the will varying or the law being broken. We know absolutely nothing of the mode of operation in any recorded miracle; we only see certain results. To affirm that these results are either impossible in themselves, or necessarily violations of natural law, is to pronounce a judgment on imperfect data. We can only say that, under an impulse which we must believe proceeds from the divine will, in which all law exists, the phenomena which we have been accustomed to expect have not followed on their ordinary conditions. But from our point of view we cannot affirm that the question as to *how* this happens is one of interference or violation; it is rather, probably, one of higher and lower action. The miracle may be but the expression of one divine order and beneficent will in a new shape—the law of a greater freedom, to use the words of Trench, swallowing up the law of a lesser.

Nature being but the plastic medium through which God's will is ever manifested to us, and the design of that will being, as it necessarily must be, the good of his creatures, that theory of miracle is certainly most rational which does not represent the ideas of

laws, and of the will of God as separate and opposing forces, but which represents the divine will as working out its highest moral ends, not against, but through law and order, and evolving from these a new issue, when it has a special beneficent purpose to serve. And thus, too, we are enabled to see in miracle not only a wonder and a power, but a sign —a revelation of divine character, never arbitrary, always generous and loving, the character of one who seeks through all the ordinary courses of nature and operation of law to further His creatures' good, and whose will, when that end is to be served, is not restricted to any one necessary mode or order of expression. Rightly interpreted, miracle is not the mere assertion of power, or a mere device to impress an impressible mind; it is the revelation of a will which, while leaving nature as a whole to its established course, can yet witness to itself as above nature, when, by doing so, it can help man's moral and spiritual being to grow into a higher perfection.

The evidence for the Christian miracles is of a twofold kind—external and internal. As alleged facts, they are supposed to rest upon competent testimony, the testimony of eye-witnesses, who were neither deceived themselves, nor had any motive to deceive others. They occurred not in privacy, like the alleged supernatural visions of Mohammed, but for the most part in the open light of day, amidst the professed enemies of Christ. They were not isolated facts; nor wrought tentatively, or with difficulty; but the repeated, the overflowing expression, as it were, of an apparently supernatural life. It seems impossible to conceive, therefore, that the apostles could have been deceived as to their character. They had all the means of scrutinizing and forming a judgment regarding them that they could well have possessed; and if not deceived themselves, they were certainly not deceivers. There is no historical criticism that would now maintain such a theory; even the most positive unbelief has rejected it. The career of the apostles forms throughout an irrefragable proof of the deep-hearted and incorruptible sincerity that animated them. The gospel miracles, moreover, are supposed in themselves to be of an obviously divine character. They are, in the main, miracles of healing, of beneficence, in which the light equally of the divine majesty and of the divine love shines—witnessing to the eternal life which underlies all the manifestations of decay, and all the traces of sorrow in the lower world, and lifting the mind directly to the contemplation of his life.

MIRACLE PLAYS. See MYSTERIES.

MIRACLES, ECCLESIASTICAL. The position of the reformed churches generally with regard to miracles is that they ceased in the church after the apostolic age, while the Romanists contend that the power to perform miracles has remained with the church and will continue forever. The arguments of the reformed are that when the work of the apostles was finished the necessity for miracles ceased, and that during the first hundred years after the death of the apostles we hear little or nothing of the early Christians working miracles. Bishop Douglas says: "I can find no instances of miracles mentioned by the fathers before the 4th century." In the 4th c. they speak of the age of miracles as past, and say that they were no longer to be expected. This is frequently asserted by Augustine, and Chrysostom testifies the same in his sermons on the resurrection and the feast of pentecost. And even when they relate remarkable deeds performed by Christian believers, and which the Roman Catholics pronounce miraculous, they declare them to be *natural* results. Bishop Douglas says that these wonderful workings were confined to "the cures of diseases, particularly the cures of demoniacs, by exorcising them; which last seems, indeed, to be their favorite standing miracle." Even prof. Newman, contrasting the scriptural and ecclesiastical miracles, says: "The miracles of Scripture are, as a whole, grave, simple, and majestic; those of ecclesiastical history often partake of what may not unfitly be called a romantic character, and of that wildness and inequality which enters into the notion of romance." Yet Butler says: "Roman Catholics, relying with confidence on the promises of Christ, believe that the power of working miracles was given by Christ to his church, and that it never has been and never will be withdrawn from her." And Bellarmine argues that the Protestant church, lacking this power, is manifestly not of God. Romanists refer to what Ignatius, of the 1st c. after Christ, relates of the wild beasts let loose upon the martyrs being restrained from hurting them, and to the miracle which prevented the apostate Julian from rebuilding the temple of Jerusalem. As to the first, Ignatius regarded the occurrence as wholly in the line of natural events. It is important to notice the fact that the writings of the ante-Nicene church are more free from miraculous and superstitious elements than the records of the middle ages, and especially of monasticism. Dr. Isaac Taylor remarks: "From the period of the Nicene council and onward, miracles of the most astounding kind were alleged to be wrought from day to day. But these miracles were, in *almost every instance*, wrought expressly in support of those very practices and opinions which stand forward as the points of contrast distinguishing Romanism from Protestantism, as the ascetic life, the supernatural properties of the eucharistic elements, the invocation of the saints, and the efficacy of their relics, and the reverence or worship due to certain visible and palpable religious symbols." Dr. Schaff makes the following remarks concerning the miracles of the Latin church: 1. Many of them have a much lower tone than those of the Bible, making a stronger appeal to our faculty of belief. 2. They serve not to confirm the Christian faith in general, but to support the ascetic life and many superstitious practices. 3. The farther removed from

the apostolic age the more numerous they are. 4. Most of the church fathers allowed falsehood for the glory of God. 5. Several church fathers concede that in their time extensive frauds with the relics of saints were already practiced. 6. The Nicene miracles were doubted and contradicted even among contemporaries. 7. The church fathers contradict themselves sometimes respecting the prevalent faith in miracles, and again maintaining that miracles in the biblical sense had long since ceased. Yet Dr. Schaff remarks that a rejection of these miracles by no means charges intentional deception in every case, for between the proper miracle and fraud there are many intermediate steps of self-deception: clairvoyance, magnetic phenomena and cures, and unusual states of the human soul, which is full of deep mysteries. Constantine's vision of the cross, for example, may be traced to a prophetic dream, and the frustration of Julian's attempt to build the Jewish temple to a special providence or a natural historical judgment of God. A conclusive argument against many, at least, of these so-called miracles is that they are trifling and childish; others indecorous; others irreverent, and even blasphemous. Those contained in the Breviary and Roman ecclesiastical histories are too numerous to recite. Finally, it may be said that many distinguished Roman Catholic authors do not accept these as genuine miracles; even pope Gregory XI., who had been persuaded by the prophecies of St. Catharine of Sienna to return to Rome from Avignon, warning all on his death-bed to beware of human beings, whether male or female, speaking under pretense of religion the visions of their own brain, for by these, he said, he had been led away.

MIRACULOUS CONCEPTION, The, denotes the supernatural formation of the bodily human nature of Jesus Christ from the substance of the Virgin Mary by the operation of the Holy Ghost. The proof by which this central article of Christianity is established was furnished, before the conception took place, by divine revelation to Mary herself and afterwards to Joseph her espoused husband. It is implied also by several particular declarations of Scripture and by its general teaching concerning the incarnate Son of God. It is the point from which is dated by most of the Christian theologians the union of the divine and human natures in the person of the Redeemer; and it gives completeness and consistency to the revelation concerning him. It exalts even his human nature by its immediately divine origin above that of the race to whom he was in all respects made like, yet without sin; and gives the necessary basis for the innumerable implications of the New Testament that his personal relation to the Father was unique in kind as well as degree. As a miracle, it accords with and is no more amazing than the miracle of his character. See Incarnation; Jesus Christ.

MIRAFLORES, Manuel De Pando, Marquis of, and count of Villapaterna, 1792-1872, b. Madrid. He was sent as ambassador to London in 1834, and to Paris in 1838. In 1846 he was president of the council of ministers, and filled the same office in 1863. He was ambassador to Vienna in 1861, and several times president of the senate. He wrote a number of works which are of value for the political history of Spain during the last fifty years. The most important is *Memoirs for the history of the first seven years of the Reign of Isabel II.*

MIRAGE', a phenomenon extremely common in certain localities, and as simple in its origin as astonishing in its effects. Under it are classed the appearance of distant objects as double, or as if suspended in the air, erect or inverted, etc. One cause of mirage is a diminution of the density of the air near the surface of the earth, produced by the transmission of heat from the earth, or in some other way; the denser stratum being thus placed *above*, instead of, as is usually the case, *below* the rarer. Now, rays of light from a distant object, situated in the denser medium (i. e., a little above the earth's level), coming in a direction nearly parallel to the earth's surface, meet the rarer medium at a very obtuse angle, and (see Refraction) instead of passing into it, are reflected back to the dense medium, the common surface of the two media acting as a mirror. Suppose, then, a spectator to be situated on an eminence, and looking at an object situated like himself in the denser stratum of air, he will see the object by means of directly transmitted rays; but besides this, rays from the object will be reflected from the upper surface of the rarer stratum of air beneath to his eye. The image produced by the reflected rays will appear inverted, and below the real object, just as an image reflected in water appears when observed from a distance. If the object is a cloud or portion of sky, it will appear by the reflected rays as lying on the surface of the earth, and bearing a strong resemblance to a sheet of water; also, as the reflecting surface is irregular, and constantly varies its position, owing to the constant communication of heat to the upper stratum, the reflected image will be constantly varying, and will present the appearance of a water surface ruffled by the wind. This form of mirage, which even experienced travelers have found to be completely deceptive, is of common occurrence in the arid deserts of lower Egypt, Persia, Tartary, etc.

In particular states of the atmosphere, reflection of a portion only of the rays takes place at the surface of the dense medium, and thus double images are formed, one by reflection, and the other by refraction—the first inverted, and the second erect. The phenomena of mirage are frequently much more strange and complicated, the images being often much distorted and magnified, and in some instances occurring at a considerable distance from the object, as in the case of a tower or church seen over the sea, or a

vessel over dry land, etc. The particular form of mirage known as *looming* is very frequently observed at sea, and consists in an excessive apparent elevation of the object. A most remarkable case of this sort occurred on July 26, 1798, at Hastings. From this place the French coast is fifty miles distant; yet, from the sea-side the whole coast of France from Calais to near Dieppe was distinctly visible, and continued so for three hours. In the Arctic regions it is no uncommon occurrence for whale-fishers to discover the proximity of other ships by means of their images seen elevated in the air, though the ships themselves may be below the horizon. Generally, when the ship is above the horizon, only one image, and that inverted, is found; but when it is wholly or in great part below the horizon, double images, one erect and the other inverted, are frequently seen. The faithfulness and distinctness of these images at times may be imagined from the fact, that capt. Scoresby, while cruising off the coast of Greenland in 1822, discovered the propinquity of his father's ship from its inverted image in the sky. Another remarkable instance of mirage occurred in May, 1854, when, from the deck of H. M. screw-steamer *Archer*, then cruising off Oesel, in the Baltic, the whole English fleet of nineteen sail, then nearly thirty miles distant, was seen as if suspended in the air upside down. Besides such phenomena as these, the celebrated *Fatà Morgana* (q.v.) of the straits of Messina sinks into insignificance. The *Specter of the Brocken*, in Hanover, is another celebrated instance of mirage. Its varieties are indeed numberless, and we refer those who wish for further information to Brewster's *Optics*, Biot's *Traité de Physique*, and for the mathematical theory of the mirage to the works of Biot, Monge, and Wollaston. See also REFLECTION and REFRACTION.

MIRAMICHI' RIVER, the second largest river in New Brunswick. It is formed by the junction of its two branches, the n.w. and s.w. Miramichi. It flows, after a course of about 100 m., into the bay of Miramichi, a part of the gulf of St. Lawrence. Pine woods line the banks of the river, which is navigable for vessels of moderate size for a distance of 40 m. from its mouth.

MIR'AMON, MIGUEL, 1832–67; b. Mexico, of French extraction. He was educated at the military academy at Chepultepec, near the city of Mexico, and was one of the defenders of that stronghold against the American assault, Sept. 8, 1847, being wounded and taken prisoner. At the end of the war he was released, and filled his term in the academy. In 1852 he was regularly enlisted in the Mexican army, and two years later had gained the rank of capt. He was distinguished in several revolutionary engagements, and was promoted to be a col. in 1855. The existing political situation becoming reversed, and Alvarez being president, Miramon found his position in the army a very delicate one. Being sent on an expedition against the enemies of the new government, he rebelled on his own account, and turned his force over to the revolutionists, whom he commanded in a successful attack on Puebla. That city being besieged by order of Alvarez, Miramon defended it with remarkable skill and spirit on two occasions. It capitulated to an overpowering force in the latter part of 1856, and Miramon, having escaped, conducted an independent fight until he was wounded and captured in the following year. He succeeded in obtaining his release, and continued to resist the government until Comonfort, who had succeeded Alvarez, retired from the presidency. The struggle now began which has passed into Mexican history as the "war of reform," in which Miramon was conspicuous on the side and at the head of the church party. Zuloaga had already succeeded Comonfort in the presidency, and on a new election Miramon was named as his successor, but declined. On the retirement of Zuloaga, however, he was appointed president *pro tem.*, when at the head of the army he continued the war against the liberals and Juarez. He was concerned in, and partly responsible for, the miserable massacre of Tacubaya in 1859. In the latter part of 1860 the liberals were successful, and Miramon fled the country. He traveled in Europe until the French intervention and the accession of Maximilian as emperor, when he received a diplomatic position abroad. In 1866 he returned to Mexico, and, with Marquez, was placed in command of Maximilian's army. He was captured May 15, 1867, and, with the emperor and gen. Mejia, was shot June 19.

MIRANDA, FRANCISCO, about 1750–1816; b. Caraccas, South America. He accompanied the French forces in their campaign in aid of American independence, then returned to South America and attracted attention by endeavoring to incite a revolution among the Spanish troops over whom he was col. He was compelled to flee, however, and next traveled in Europe, where he obtained the friendship particularly of the Russian empress Catherine II., William Pitt, and leaders in the French revolution. While in Paris, in 1790, the Girondists appointed him a maj.-gen., and he attended Dumouriez in his campaign against the Prussians. Though he was a skillful commander, the forces under his command met with little success; and a defeat at Neerwinden was attributed to his treachery, a suspicion that caused his arraignment before the revolutionary tribunal. After the fall of the Girondists he was threatened with transportation, and fled to England. In 1803 Napoleon banished him again, and he visited New York, where he obtained assistance in a second attempt to overthrow the power of Spain in South America. Two vessels were fitted out for him, and he sailed for South America in 1806. But the undertaking came to nothing, and it was not until 1810 that he succeeded in gaining a triumph, and compelled the subjugation of Valentia,

Puerto Cabello, and nearly the whole of New Granada. This lasted a yea . The Spanish monarchy then gained the ascendency; Miranda was forced to surrender; and, in violation of the conditions, he was sent to Spain, where he died in the dungeons of the inquisition.

MIRANDOLA, a t. of northern Italy, in the province of Modena, and 20 m. n.n.e. of the city of that name. It stands in the midst of a low-lying and somewhat unhealthy flat, and contains numerous churches, a cathedral, and a citadel. Rice is much cultivated in the vicinity, and the breeding of silk-worms is an important branch of industry. Pop. of town, '71, 3,059; of commune, 13,170.

MIRANDOLA, Pico della. See Pico, Giovanni della Mirandola, *ante.*

MIRBEL, Luzinska Aimée Zoë Rue, 1796–1849; b. at Cherbourg, France. Most of her life was spent in Paris, where she married in 1820 the celebrated naturalist, Charles François Brisseau Mirbel, and won a high reputation as a miniature and portrait painter.

MIRECOURT, a t. of France in the department of Vosges, in a picturesque district, 20 m. s. of Nancy. It is famous for its manufactures of lace, and of church organs and stringed musical instruments. Pop. 5,500.

MIRÈS, Jules, 1809–71; b. in Bordeaux, of Jewish parentage. He opened in Paris as a broker, became director in a gas company, and in 1848 purchased the *Journal des Chemins de Fer* in company with Moïse Millaud. They afterwards purchased the *Conseiller du Peuple,* the *Constitutionnel,* and other journals; then founded the *Caisse des Chemins de Fer,* or railway bank, and, by means of all these agencies skillfully employed, acquired great fortunes. In 1860 Mirès negotiated a Turkish loan. In 1861 he was arrested for fraud and condemned to five years' imprisonment and a fine. Appealing from the first decision to the imperial court the judgment was confirmed; the court of cassation set it aside; but on a second trial before the same court the judgment was finally affirmed, and Mirès served in the penitentiary till 1866, when he returned to Paris, resumed banking, and published *Un Crime Judiciére.*

MIRFIELD, a manufacturing village of the West Riding of Yorkshire, England, three m. e. of Dewsbury. The manufactures are fancy and other woolen fabrics, and cotton goods. It is one of the chief railway centers in the country. Pop. '81, 11,512.

MIRIAM (Gr. *Mariam,* Lat. *Maria,* Eng. *Mary*), the sister of Moses, the leader and lawgiver of the Hebrews. She is presumed to be the sister who watched him when an infant concealed in a basket on the banks of the Nile. On occasion of the deliverance of Israel from Pharaoh and his host at the Red sea, she led the Israelitish women forth with music, taking up in response the song of Moses, and enjoining her followers to "Sing to the Lord." She is styled Miriam the prophetess, and in the book of Micah is classed with Moses and Aaron in the words, "I sent before thee Moses, Aaron, and Miriam." She seems, however, to have been the instigator as well as a sharer in the rebellion of Aaron against Moses on occasion of the coming of Moses's wife to the camp, as the whole punishment was visited upon her. She died, and was buried in the first month after the 40th year of the Exodus, at Kadesh-barnea, where her sepulcher was still shown in the time of Eusebius.

MIRKHOND', 1433–98; b. Persia; the author of a voluminous work relating to Persian history, entitled *Garden of Purity in the History of the Prophets, Kings, and Caliphs,* of which there are manuscripts in the libraries of London, Paris, Berlin, and Vienna. Besides the fragments in Wilkins's Persian grammar, portions of the work have been published in Persian and Latin in *The History of the Persian Kings,* by the German scholar Jenisch; also, in Silvestre de Sacy's *Mémoires sur diverses Antiquities de la Perse,* in Jourdain's *Notice de l'Histoire Universelle de Mirkhond,* and in English by David Shea under the title of *History of the Early Kings of Persia* (London, 1832).

MIRPUR', a flourishing t. of India, in Sinde, on the left bank of the Piniari, 45 m. s. of Hyderabad. It contains a fort capable of accommodating 200 men, and which commands the route from Hyderabad to Cutch. The surrounding district is fertile and well cultivated. Pop. 3,000.

MIRROR, a reflecting surface, usually made of glass, lined at the back with a brilliant metal, so as strongly to reflect the image of any object placed before it. When mirrors were invented is not known, but the use of a reflecting surface would become apparent to the first person who saw his own image reflected from water; and probably for ages after the civilization of man commenced, the still waters of ponds and lakes were the only mirrors; but we read in the Pentateuch of mirrors of brass being used by the Hebrews. Mirrors of bronze were in very common use among the ancient Egyptians, Greeks, and Romans, of which many specimens are preserved in museums. Praxitcles taught the use of silver in the manufacture of mirrors in the year 328 B.C. Mirrors of glass were first made at Venice in 1300; and judging from those still in existence—of which one may be seen at Holyrood palace, in the apartments of queen Mary—they were very rude contrivances, compared with modern ones. It was not until 1673 that the making of mirrors was introduced into England. It is now a very important manufacture; and mirrors can be produced of any size to which plate glass can be cast. After the plate of glass is polished on both sides, it is laid on a perfectly level table of great

strength and solidity, usually of smooth stone, made like a billiard table, with raised edges; a sheet or sheets of tin foil sufficient to cover the upper surface of the glass are then put on, and rubbed down smooth, after which the whole is covered with quicksilver, which immediately forms an amalgam with the tin. The superfluous mercury is then run off, and a woolen cloth is spread over the whole surface, and square iron weights are applied. After this pressure has been continued a day and night, the weights and the cloth are removed, and the glass is removed to another table of wood, with a movable top, which admits of gradually increasing inclination until the unamalgamated quicksilver has perfectly drained away, and only the surface of perfect amalgam remains coating the glass, and perfectly adherent to it.

Heat is reflected like light; so that a concave mirror may be used to bring rays of heat to a focus. In this way combustible substances may be set on fire at a distance from the reflector whence they receive their heat. Thus used, a mirror is called a *burning-mirror*.

MIRTA, a t. of India, in the Rajpoot state of Jodhpur, stands on high ground, near the source of a tributary of the Luni, 230 m. s.w. of Delhi. Mirta is supplied with good water from three large tanks. Pop. estimated at 25,950.

MIRZA, a contraction of *Emir Zadah*, "son of the prince," is, when *prefixed* to the surname of the individual, the common title of honor among the Persians; but when *annexed* to the surname, it designates a prince or a male of the blood-royal.

MIRZAPUR, a t. of British India, capital of the district of the same name, on the right bank of the Ganges, which is here half a mile wide, and crossed by a ferry, 40 m. s.w. of Benares. It has some manufactures of carpets, cottons, and silks, and is the greatest cotton-mart in India. Pop. '72, 67,274. The *district* of Mirzapur, in the *North-west Provinces*, is watered by the Ganges and the Sone. Lat. 23° 50′ to 25° 30′ n.; long. 82° 11′ to 83° 39′ e. Area, 5,235 sq. miles. Pop. '72, almost all Hindus, 1,054,413. The chief productions, besides the usual cereals, are cotton, indigo, and sugar. The climate is, on the whole, unhealthy for Europeans.

MISCEGENATION. See page 881.

MISDEMEA′NOR is one of the technical divisions of crimes, by the law of England and Ireland. The usual division of crimes is into treason (which generally stands by itself, though, strictly speaking, included in), felony, and misdemeanor. The offense of greatest enormity is treason, and the least is misdemeanor. The original distinction between felony and misdemeanor consisted in the consequences of a conviction. A party convicted of felony, if capital, forfeits both his real and personal estate; if not capital, his personal estate only. A party convicted of misdemeanor forfeits none of his property. The distinction is not kept up between the two classes of crimes by any greater severity of punishment in felony, for many misdemeanors are punished as severely as some felonies. But it has been the practice of the legislature, when creating new offenses, to say whether they are to be classed with felony or misdemeanor; and when this is done, the above incidents attach to the conviction accordingly.

MISDEMEANOR (*antè*), in the United States, is such a criminal act under common law or statute as is not included in common law or statutory felonies and is not treason. The term does not include, in its legal application, offenses against police regulations, city by-laws, and the like, though in common language it may extend to any misbehavior. It is evident that what is a statute-felony in one state may be a misdemeanor in another, and it is therefore impossible to give a complete classification of such offenses. They may be crimes against public justice, peace, health, or trade; against personal or property rights of individuals; or may be mere attempts and solicitations. Bouvier defines the word as applied to "all those crimes and offenses for which the law has not provided a particular name. Sometimes, but in this country rarely, the term *misprision* is used to include all higher classes of misdemeanor. Misdemeanor may be punished by trial brought either after indictment or information—that is, presentation by either a grand jury or a public prosecutor; and in most states the rule prevails that where felony is charged in the indictment but the evidence proves only an offense amounting to misdemeanor, conviction may be had of the latter.

In some states it is provided that upon acknowledgment of satisfaction by the injured party, in such cases as assault and battery or malicious mischief, the criminal procedure shall, with the consent of the magistrate, be dropped; a course which, obviously, would be improper in dealing with felonies.

MISE′NO, a promontory of the province of Naples, 9 m. s.w. of the city of Naples. On the outskirts of the promontory are the extensive ruins of the ancient city of Misenum, including a vast church and theater. Miseno is much visited on account of its wonderful grotto Draconara, and a curious subterranean building or labyrinth, called the Hundred Chambers, supposed to have been anciently employed as dungeons.

MISERE′RE, the name by which, in Catholic usage, the 50th psalm of the Vulgate (51st in authorized version) is commonly known. It is one of the so-called "Penitential Psalms," and is commonly understood to have been composed by David in the depth of his remorse for the double crime which the prophet Nathan rebuked in the well-known parable (2 Sam. xii.). Another opinion, however, attributes this psalm to Manasses, or to some of the psalm-writers of the captivity. The Miserere is of frequent occurrence

in the services of the Roman church; and in the celebrated service of Tenebræ, as performed in the Sixtine chapel at Rome, it forms, as chanted by the pope's choir, one of the most striking and impressive chants in the entire range of sacred music. It is sung on each of the three nights in holy week (q.v.) on which the office of Tenebræ is held, with different music on each of the three occasions, the three composers being Bai, Baini, and the still more celebrated Allegri.—Misereré is also the name of one of the evening services in Lent, which is so called from the singing of that psalm, and which includes a sermon, commonly on the duty of sorrow for sin.

MISERERE, a projection on the under side of the seats of the stalls of mediæval churches and chapels, etc. They are usually ornamented with carved work, and are so shaped that when the seats proper are folded up, they form a small seat at a higher level, sufficient to afford some support to a person resting upon it. Aged and infirm ecclesiastics were allowed to use these during long services.

MISFEA'SANCE, in legal language, means the doing of a positive wrong, in contradistinction to nonfeasance, which means a mere omission. Acts are sometimes followed with different legal consequences, according as they fall under the head of misfeasance or nonfeasance.

MISHAWA'KA, a village in n. Indiana, a part of the township of Penn, on the s. bank of the St. Joseph river, navigable to this place, and furnishing good water-power; pop. '80, 2,640. It is 4 m. e. of South Bend, and 11 m. w. of Elkhart, and has a station on the Northwestern Grand Trunk railway, and the Lake Shore and Michigan Southern. It has excellent public schools, 7 churches, 1 bank, water-works, and important industries, comprising the manufacture of flour, axes, refrigerators, wind-mills, pumps, brushes, furniture, agricultural implements, etc., and a variety of stores.

MISH'MEE BITTER, the root of *Coptis teeta* (see COPTIS), a plant found in the mountainous regions on the borders of India and China; of the same genus with the golden thread of the northern parts of the world, and not unlike it. The root is in much use and esteem in some parts of the east as a stomachic and tonic, and has begun to be known in Europe.—The root of *C. trifoliata* is also used as a bitter.

MISHNA (from Heb. *shana,* to learn; erroneously held to designate repetition) comprises the body of the "oral law," or the juridico-political, civil, and religious code of the Jews; and forms, as such, a kind of complement to the Mosaic or written law, which it explains, amplifies, and immutably fixes. It was not, however, the sole authority of the schools and the masters on which these explanations and the new ordinances to which they gave rise depended, but rather certain distinct and well-authenticated traditions, traced to Mount Sinai itself. No less were certain special letters and signs in the written law appealed to in some cases, as containing an indication to the special, newly issued, or fixed prohibitions or rules. See HALACHA. The Mishna (to which the Toseftas and Boraithas form supplements) was finally redacted, after some earlier incomplete collections, by Jehudah Hanassi, in 220 A.D., at Tiberias. It is mostly written in pure Hebrew, and is divided into six portions (Sedarim): 1. Zeraim (Seeds), on Agriculture; 2. Moed (Feast), on the Sabbath, Festivals, and Fasts; 3. Nashim (Women), on Marriage, Divorce, etc. (embracing also the laws on the Nazirship and vows); 4. Nezikin (Damages), chiefly civil and penal law (also containing the ethical treatise Aboth); 5. Kadashim (Sacred Things), Sacrifices, etc.; description of the Temple of Jerusalem, etc.; 6. Tehoroth (Purifications), on pure and impure things and persons. See also TALMUD.

MISILME'RI (corrupted from *Menzil-al-Amir*, village of the Emirs), a t. of the island of Sicily, in the province of Palermo, 7 m. s.e. of Palermo city. It is a straggling, poverty-stricken town. It was at Misilmeri that Garibaldi, in May, 1860, joined the Sicilian insurgents; and it was by a short cut from Misilmeri to Palermo, through the pass of Mezzagna, that he advanced on the latter city and took it by a *coup de main.* Misilmeri used to be a notorious harbor of banditti. Pop. 7,250.

MISKOLCZ', the principal t. in the co. of Borsod, Hungary, situated at the extremity of a beautiful valley, 25 m. n.e. of Erlau. It is connected with Debreczin by railway, and contains numerous churches, two gymnasia, and other educational institutions. Wine and melons are extensively cultivated. From the iron obtained in the vicinity, the best steel in Hungary is made. The chief trade is in wine. Pop. '80, 24,319.

MISNIA. See MEISSEN, *ante.*

MISNO'MER is the giving of a wrong name to a party in a suit. Formerly the objection of misnomer was of some importance, but now is of none, as it is easily cured by amendment.

MISNOMER, an instance of erroneous or erratic nomenclature, often proceeding on the *lucus a non lucendo* principle, as in the case of the so-called "German silver," which is not silver, was not invented or discovered by a German, and was in use in China ages ago. Among the large number of expressions which may be called misnomers the following are in common use in the English language: Black-lead, which is compounded of carbon and iron; blind-worms, which are not blind; Brazilian grass, which is not grass, but strips of palm-leaf, and comes from Cuba and not Brazil; Burgundy pitch is

not pitch, but is prepared from frankincense and comes from Hamburg; catgut is the gut of sheep, instead of cat's; china, applied to porcelain, whether English, French, or of other countries; cuttle-bone, which is not bone, but a chalky deposit contained in a sac occurring in the body of the cuttle-fish; Cleopatra's needle, which was erected by Rameses the great, and had no reference to Cleopatra; Dutch clocks, made in Germany instead of Holland; galvanized iron is not galvanized, but coated with zinc in a bath of muriatic acid; Gothic architecture was not the architecture of the Goths, but originated in England and France at a period prior to the renaissance; Indians (North American), applied to the aborigines of America by the early voyagers, who supposed that country to be a part of India; Irish stew, a dish unknown in Ireland; lacquer, which is made not from lac, but from a resin obtained from a nut-tree (*anacardiaceæ*); kid gloves, which are made of lamb, sheep, or rat skins; lunar caustic (nitrate of silver), so called because silver is the astrological symbol of the moon; meerschaum (foam of the sea), which is a compound of silica, magnesia, and water; pen, from the Latin *penna*, a wing, referring to the quill, becomes inappropriate when applied to a fabrication of steel or gold; Pompey's pillar was not erected by or in honor of Pompey; rice-paper, which is made not from rice, but from the pith of a Chinese plant of totally different character; salt, which is not chemically a salt; scuttle, applied to opening a hole in a ship, really means to close or bar; sealing-wax, which is not wax, but is composed of shellac, turpentine, and cinnabar; slave, which originated in a word (slavi) meaning illustrious, noble; tube rose, which is not a rose; turkeys, which did not originate in Turkey, but in North America; whalebone, which is not a bone.

MISPICK'EL, a mineral that occurs in trimetric crystals and which is composed of 33.54 per cent of iron, 33.42 per cent of arsenic, and 21.08 per cent of sulphur. Its color is silver-white, inclining to steel-gray; its hardness, 5.5 to 6; and its specific gravity, 6 to 6.4. Heated in a tube, it first yields a red or brown sublimate of sulphide of arsenic, then a black sublimate of metallic arsenic. Nitric acid decomposes it, with separation of sulphur and arsenious acid; nitro-muriatic acid, with separation of sulphur alone, which may be completely dissolved by prolonged digestion. It is found principally in crystalline rocks, especially associated with silver, tin, lead, and zinc ores; and is used chiefly in the manufacture of white arsenic.

MISPRIS'ION is, in English law, a clerical error made in drawing up a record of a court of law.

***MISREPRESENTA'TION**, in point of law, or, as it is most frequently termed, fraudulent misrepresentation, is that kind of lie for which courts of law will give redress. It consists in a willful falsehood as to some material thing connected or not with some contract; the object being that the party deceived should act upon it as true. The legal result is, that if the party so relying on its truth and acting on it suffer damage, he can sue the deceiver for such damage. It has sometimes been supposed that the deceit or misrepresentation must have reference to some contract, or arise out of some confidential relation between the parties, and that the party making it should have some private interest to serve; but this is mistake; and recent cases have established, that if a person willfully—i.e., either not knowing anything at all one way or the other about the matter, or knowing the real truth, misrepresent something with the intention that a stranger should act on such misrepresentation, and such stranger does so act on it, and suffer damage, then the right of action accrues to the deceived party. One remarkable exception to this doctrine, however, occurs in the case of the contract of marriage, where either party has in general no remedy whatever against the other for misrepresentations as to his or her property, connections, etc. It is not necessary that the misrepresentation should be made in writing, in order to give rise to the action, except in cases where the party gives representations as to the conduct, credit, ability, trade, or dealings of a third party, in order that such third party shall obtain credit, money, or goods thereby. The doctrine of misrepresentation has acquired great consequence of late, owing to the extension of the system of joint-stock companies, and the practice of the directors and officers publishing or being parties to fraudulent reports, accounts, and circulars as to the credit and stability of such undertakings. It is now settled, that not only every director, but every clerk in the service of the directors, who knowingly and willfully concurs and takes a part in publishing or circulating such false reports, whereby strangers are led to believe and act on them, and thereby suffer pecuniary loss, is liable to an action of damages at the suit of such strangers. It is also a general rule affecting contracts (other than marriage), that misrepresentation in some material point bearing on the contract, and likely to induce the party to enter into such contract, will render the contract void; but in order to make a trifling misrepresentation have the same effect, the party must warrant such representation to be true; in which case, whether trifling or not, or whether willful or not, a misrepresentation avoids the contract; and this is generally the case in contracts of life and fire insurance. Against such a practice lord St. Leonards lately remonstrated, as one involving great hardship to the class of insurers, who, after paying premiums for years, find at last their security gone. Another class of fraudulent misrepresentations, of great consequence, and now brought within the criminal law to a large extent, is that of counterfeiting trademarks, as to which, see TRADE-MARKS. See *Supp.*, page 881.

MISSA DI VO'CÉ, a term used in the art of singing, meaning the gradual swelling and again diminishing of the sound of the voice on a note of long duration.

MISSAL, the volume containing the prayers used in the celebration of the mass. Anciently, considerable variety in minor details prevailed among the books in use in different countries, and even in different churches of the same country. With the view of restoring uniformity, the pope, in virtue of a decree of the council of Trent, in 1570, ordered that all churches which had not, for a clearly ascertained period of 200 years, enjoyed an uninterrupted use of a peculiar service-book of their own, should henceforth adopt the Roman missal. Of this exemption, several churches in Germany, France, and even in Italy, availed themselves; but in later times the great majority have conformed to the Roman use. The Roman missal has twice since that date been subjected to revision and correction—in 1604 by Clement VIII., and in 1634 by Urban VIII. The latter recension still continues in use. The missals of the oriental rites differ from that of the Roman church, each having for the most part its own proper form. See LITURGY.

MISSAL (*ante*), Lat. *missale plenarium* or *plenarium*, the book which contains the ritual for the celebration of the various masses of the Roman church, was called in the early western church *sacramentarium*, but at that time it contained only parts of what is now included in the missal. Those copies which contained the gospels, the sacramentary, prayers, prefaces, benedictions, the canon, lectionary, epistles and the antiphon were called *plenars;* but commonly these parts of the missal were in separate volumes. The entire missal was required when the priests began to say low masses. The earliest Gothic or Gallican missals of the 6th c. contained only the canon, prayers, and prefaces, which were recited by the bishop or priest; afterwards, those of small churches had the introit, gradual, alleluia, offertory, sanctus and communion. To meet a general desire for an emendation of the missal it was decided by the council of Trent, after a protracted discussion, to recommend to the pope the reform of the breviary, missal, and rituals. He consented, and the work was begun in Rome under Pius IV., and finished under Pius V. in 1570. The new missal consists of an introduction, three parts, and an appendix. The introduction gives the calendar and the general rubrics; the three parts give the formularies for the successive services of the year, those for the celebration of the mass on special feasts of saints, etc.; the appendix gives the annual mass, masses for the dead, some benedictions, and masses for certain prescribed feasts.—In the English church before the reformation the missals were very different, and even after the compilation of the Roman missal, the English were generally used; but at the end of the 16th c. the Jesuits forced the Roman missal upon the Roman Catholic churches of England. Before the invention of printing, the missals were elegantly written, ornamented with beautiful initials, and superbly bound. In the 13th c. large letters were used in writing the missals.

MISSAU'KEE, a co. in central Michigan, drained by Clam lake, Muskrat lake, and the headwaters of the Muskegon, Manistee, and Clam rivers; 576 sq.m.; pop. '80, 1553—994 of American birth. Its surface is considered fertile, is generally level, with a large proportion of timber land, and very thinly settled. Capital, Lake City.

MISSINNIP'PI RIVER. See CHURCHILL RIVER, *ante.*

MISSION, a term used by Roman Catholics and English and American ritualists in a sense similar to the word *revival.* Among Roman Catholics a mission consists of special religious services conducted generally by one who has no parish, and belongs to a monastic order. In this sense the word is modern. In the church of England and the Protestant Episcopal church in the United States the word denotes "a series of services in which prayer, praise, preaching, and personal exhortation are the main features, and is intended to call souls to repentance and faith, and deepen the spiritual life in the faithful." It is held in a parish or several parishes under the direction of the rector, or by some experienced priest whom he obtains to assist him. "Its themes are heaven, hell, the judgment, sin, the atonement for sin, God's justice and God's mercy." "The purpose is the proclamation of the old foundations of faith and repentance to souls steeped in worldliness and forgetful of their destiny, whether they be the souls of the baptized or the unbaptized." The usual time for the "mission" is Lent. In England it has been a custom for several years, and is approved by the bishops, who prescribe no rules for its observance, but leave it to the good judgment of the clergy. It is not yet favored by many in the Episcopal church in the United States. In these services the prayers are, or at least may be in part, extemporaneous; much preaching is allowed, and the preaching is earnest, personal, and practical; familiar hymns and tunes are used, and the singing is congregational. *The Church Journal and Gospel Messenger* favors the "mission."

MISSIONS, enterprises of the Christian church for the conversion of the nations to Christianity, by sending to them teachers called *missionaries.*

The first Christians displayed great zeal in preaching the gospel to the heathen, Christian teachers continued to go forth for this purpose into heathen countries until about the 9th c., and although other and less worthy means were too often employed, the labors of Palladius in Ireland, of Columba in Scotland, of Augustine in England, of Gallus and Emmeran in Alemannia, of Kilian in Bavaria, of Willibrod in Franconia, of Swidvirt in Friesland, of Siegfried in Sweden, of Boniface in Thuringia and Saxony, of

Adalbert in Prussia, of Cyril and Methodius amongst the Slavonians, and of many such early missionaries, were unquestionably very instrumental in the extension of Christianity in Europe. After the reformation, the Roman Catholic church, roused to activity by its losses and dangers, not only sent forth missionaries to confirm its adherents in Protestant countries, and to win back Protestants, but also sought to repair its losses by new acquisitions from the vast domain of heathenism. With this view, the *Congregatio de Propagandâ Fide* was constituted by Gregory XV. in 1622, and the *Collegium de Propagandâ Fide* (see PROPAGANDA) by Urban VIII. in 1627, and in a number of places institutions called *seminaries* were established for the training of missionaries. Jesuit missionaries earnestly prosecuted their work amongst the Indians of South America, from the middle of the 16th c. to the middle of the 18th, when they were expelled by the Portuguese and Spanish governments, because their political power had become too formidable. They are accused of administering baptism with too great readiness; but they were certainly successful in extending civilization amongst the Indians, particularly of Paraguay. Jesuit missions to India and Japan were founded by Francis Xavier (q.v.) in the middle of the 16th century. In Japan, the missionaries made great progress at first; and in 1582 they boasted of 150,000 converts, 200 churches, and 59 religious houses of their order in that empire; but ere the middle of the 16th c. the whole work had been overthrown, and every missionary expelled. In China similar rapid success was enjoyed, and was followed by a similar period of persecution, although the destruction effected was more partial than in Japan, and the church of Rome continued to subsist in China, its missionaries and members enduring great hardships, and many of them evincing their sincerity even by their death. There are not a few Roman Catholics in China at the present time. In Abyssinia, also, the Jesuits made great progress in the 17th c., and for a time attained great power in the country; but their interference in political matters led to their complete expulsion. In the 17th c. the Jesuits boasted of the vast success of their mission in Madura, a province of southern India; but it was found to be rather apparent than real, and to have been attained by a compromise of Christianity and the employment of unworthy means, so that, after long contests in the papal court, a decision was pronounced against the Jesuits, and their connection with Madura was dissolved in the middle of the 18th century.

For a long period after the reformation, the Protestant church seems to have been little sensible of the duty of laboring for the propagation of Christianity; nor was it until the present century that missionary zeal began to be largely developed. In the middle of the 17th c. (1647), indeed, an act of the English parliament established the *Society for Propagating the Gospel in Foreign Parts*, and at the close of the century (1698) the *Society for Promoting Christian Knowledge* was established. A few missionaries labored with zeal and success among the North American Indians, in which field the names of Eliot and Mayhew are particularly distinguished in the 17th c., and that of Brainerd in the 18th; but the commencement of more systematic and continuous missionary enterprise may be reckoned from the establishment of the first Protestant mission to India, which did not take place till the beginning of the 18th c., when Bartholomew Ziegenbalg and another were sent thither by Frederick IV. of Denmark, and settled in a small territory then belonging to Denmark on the coast of Coromandel. The mission in the s. of India soon received the support of the English *Society for Promoting Christian Knowledge*, and was maintained and extended chiefly by that society during the whole of the 18th century. Amongst the missionaries who labored in this field, the name of Swartz is particularly distinguished; and the success which attended his exertions, and the influence which he acquired in the country, were equally remarkable. He died in 1798. Since that time, the missionary work in the s. of India has been carried on with continued success, and by the missionaries of a number of societies. Greater progress has been made there than in any other part of India, nor, indeed, was the work commenced in any other part of India till almost a century later.—The Moravian church early entered upon missionary enterprise, and was the first Protestant church which did so in its united or corporate character; and very successful missions of the United Brethren were planted in the 18th c. at the cape of Good Hope, in the West Indies, and in Labrador. Greenland had previously been made the field of similar enterprise by missionaries from Norway. The mission to Greenland was founded by Hans Egede (q.v.) in 1721, and has been maintained to the present day. Its success has been such, that the greater portion of the Greenlanders have now been converted to Christianity, and much of the rudeness of their former manner of life has disappeared.—Towards the close of the 18th c., some of the great missionary societies still existing in England were formed—the *Baptist Missionary Society* in 1792, the *London Missionary Society* in 1795. About the same time the *British and Foreign Bible Society* and the *Religious Tract Society* were formed, which have co-operated with all the missionary societies as most important auxiliaries. The *Baptist Missionary Society*, immediately after its formation, sent missionaries to the n. of India. Dr. Carey was one of its first, and also one of its most eminent missionaries. India is now a field of labor for many missionary societies, not only of Britain, but also of America and of the continent of Europe

The *London Missionary Society* sent its first missionaries to the South Sea islands, and the mission was maintained for about 16 years, amidst many difficulties, without any apparent success; but its success was afterward great and rapid, first in Tahiti, and afterward

in other islands, so that now many of the islands of the South Seas are entirely Christian. The London missionary society soon entered also upon other fields of labor, and now maintains missions to many parts of the world. It was at first composed of members of almost all Protestant denominations; but the formation of other societies, and the engagement of churches as such in missionary enterprise—as the Wesleyan Methodist church—have left this society now in a great measure to the English independents. One of the most important societies founded during the present century, the *Church Missionary Society*, formed by members of the Church of England, has sent forth missionaries to many fields. They have been particularly successful in New Zealand, the w. of Africa, and about Hudson's bay; and they recently entered Abyssinia. The various churches in Scotland also support vigorous mission agencies. The late Dr. Livingstone, of the London missionary society, explored vast regions in Central Africa. Fired by his example, the friends of missions in Scotland subscribed £12,000 to found *Livingstonia*, a memorial mission station on lake Nyassa, under the management of the Free Church foreign missions committee; and an expedition arrived there and established itself in 1876. Various other missionary societies, Catholic and Protestant, have selected stations in the region of the great lakes. The Wesleyan Methodists have missions in many parts of the world. They have been particularly successful in the Fiji islands, and in parts of the w. of Africa.—The *American Board of Commissioners for Foreign Missions* was formed in 1810, and was soon followed by other missionary societies in America, some of which rival those of Britain in magnitude and importance. One of the first enterprises of the American board was the mission to the Sandwich islands, founded in 1819, which has resulted in the general Christianization of these islands, and in their civilization to a degree which, considering the shortness of the time, may well be regarded with admiration. The *American Baptist Missionary Society* has occupied Burmah and the eastern peninsula as one of its principal spheres of labor, and there its missionaries have enjoyed remarkable success in the Christianization and civilization of the people called Karens. Protestant missionary societies have also been formed on the continent of Europe, of which the first was that of Basel, in 1816, and the next was that of Berlin, in 1823; and some of these have also maintained successful missions in heathen countries. The instances of most marked and extensive success of missions are those which have been already noticed, and that of Madagascar, where missionaries of the London missionary society enjoyed the protection and favor of king Radama I., and the church planted by them continued to exist, notwithstanding severe persecution, and the martyrdom of not a few of its members, during the next reign, and is a wonderfully flourishing church at the present day. In the s. of Africa, also, important results have been attained. Access has recently been obtained to China, and a number of Protestant churches and societies have entered energetically upon that field. Preparation had been previously made for this, by missionary labors amongst the Chinese in the eastern peninsula, and by the study of the language, the compilation of grammars and dictionaries, and the translation of the Bible into the Chinese language. Indeed, it must be reckoned as among the services rendered to mankind by Christian missionaries in modern times, that they have not only translated the Bible and other religious books into many languages, but have reduced many barbarous tongues to writing, and have prepared grammars and dictionaries, thereby contributing not a little, independently of their highest aim, to the promotion of knowledge, civilization, and the welfare of the human race.

The progress of Christian missions to Mohammedan countries has hitherto been very small, although numerous converts from Mohammedanism, as well as from heathenism, have been made in India. Of late, some have thought they observed a movement among the Mohammedans of India, apparently tending toward Christianity; but at the same time there has been a new awakening of Mohammedanism itself in the eastern peninsula and the islands of the Malayan archipelago. Missions to the Jews have for several years engaged not a little of the attention of some portions of the Christian church, particularly in England and Scotland. Missions have been planted in places where Jews are numerous, and already with considerable success.

MISSIONS, CHRISTIAN FOREIGN (*ante*). The foundation of the work of missions is the command of Christ given to his disciples immediately before his ascension, "Go ye into all the world, and preach the gospel to every creature." Tracing the apostles and early Christians in their fulfillment of this command, we find at the close of the 1st c. many large churches in Asia Minor, Macedonia, Italy, Greece, and the islands of the Mediterranean, and in Northern Africa. In the beginning of the 2d c. the persecutor Pliny, in his official report to the emperor Trajan, says: "Many persons of every rank are accused [of Christianity]. Nor has the contagion of this superstition pervaded cities only, but the villages and open country." Justin Martyr, A.D. 106, says, "There is not a nation, Greek or barbarian, among whom prayers and thanksgivings are not offered to the Father and Creator in the name of the crucified Jesus." Tertullian, in his "Apology" about the middle of the 2d c. says, "Though of yesterday, we have filled every sphere of life—the exchange, the camp, the populace, the palace, the forum." Such an extension of Christianity in the face of stripes, imprisonment, and death, speaks strongly for the missionary zeal of those early times. During the 2d and 3d centuries we find that missionaries have been successful in Gaul, southern Germany, Arabia, and

Ethiopia. Early in the 4th c. Constantine, constrained by the prevalence of Christianity among all classes of his people, immediately subsequent to the terrible persecution by Diocletian, published, A.D. 312, his edict of toleration throughout the Roman empire. There is evidence that the Nestorians began in the 4th c. and for a thousand years carried on missions in central and eastern Asia. But no missions were more successful in these early times than those from Ireland to continental Europe in the 5th and 6th centuries. In the 5th c., the gospel was preached in Ireland by Patrick, who, born of Christian parents, and instructed in the gospel, having been twice taken captive by pirates, and carried to Ireland as a slave, felt impelled, after escaping the second time, to return to the land of his bondage, and make known there the gospel. He preached with such power that the island became nominally Christian before his death. Born in France, or in Scotland, he was ordained in France; he seems to have had no close attachment to the Roman church; and his successors long resisted the efforts of the pope to bring them under control. He established schools for educating the people in the gospel, and for training a native ministry and missionaries. At his death there were in Ireland many of these institutions, from which missionaries went forth in the 6th and 7th centuries to evangelize the barbarians of central Europe. Here also they established many schools, one of which was at Erfurt, where Luther studied centuries later. Columba went in the 6th c. from the institution of Bangor, Ireland (sometimes confounded with Bangor in Wales), with 12 associates, founded the celebrated school in Iona, which attained a high reputation for biblical studies, and from which missionaries went to the northern and southern Picts of Scotland, to the eastern coast of England, and to the European continent. Columbanus from the same institution took 12 young men, and carried the gospel to the Burgundians, Franks, Swiss, and Italians; also to the Bavarians and other Germanic nations. His pupil Gallus, also an Irishman, was the apostle of Switzerland. Neander says that when Columbanus entered Germany at the close of the 7th c. it was almost wholly heathen, but before 720 the gospel had been proclaimed by himself and his countrymen, and "all the German tribes were obedient to the faith as taught by the Irish missionaries." "Their teachings," as shown by Ebrard, "consisted in reading the Scriptures in the original text, translating them wherever they went, expounding them to the congregations, and recommending their diligent perusal. These were their only rule of faith." These missions and institutions were in the 8th c. absorbed by the Roman church, and in the 12th c. the Irish clergy were subjected to its sway. Iceland, Christianized in the 10th c., sent out missionaries in the exploring ships of the Norsemen, and is believed to have carried the first knowledge of Christ to the Greenlanders in the 12th century.

Returning to the Roman empire we find that the cessation of persecution, though most just and beneficent, opened the way for evils which hitherto had lacked opportunity of development. The state having become reconciled to the church, the church in turn became reconciled to the state, caught its spirit and imitated its modes. Christ had said to his disciples, "The princes of the Gentiles exercise authority, but it shall not be so among you." The church lost sight of this, and pastors, who had hitherto served the flock, and won honor by their service, began to change the crook into the rod. Not at once, or rapidly, but gradually the spirit of domination grew. Those who gained power sought to extend it by increasing the number of nominal converts, and proselytism rather than conversion became the passion of the time. Gregory the Great in 596 sent Augustine with 40 monks to effect the conversion of the Anglo-Saxons. The Irish missions from the school of Iona had already introduced the gospel along the eastern shores of England. Ethelbert, king of Kent, had married a Christian princess, and yielding to the eloquence of Augustine, or the persuasions of his wife, was baptized. Many of his subjects followed his example, 10,000 being received into the church on one occasion. Augustine was made archbishop, and claimed to govern the older Christian churches, as well as his own converts. Those churches indignantly objected, saying, "We are all prepared to hearken to the pope of Rome and to every pious Christian, so as to manifest to all perfect charity. What other duty we owe to him whom you call pope, we do not know." The influence of Augustine with the Saxon kings, however, gave him the advantage in the contest, and before the Norman invasion few ventured to dissent from the Roman forms of worship. In 718 Gregory II. sent Boniface to Germany, not so much to convert heathen as to bring over to the Roman see the churches which had received the gospel through missionaries from Ireland, Burgundy, and Byzantium. Thenceforward the secular arm was often used for the extension of the faith, and where power was lacking for coercion, resort was often had to other measures which were at utter variance with the spirit of Christianity.

Before the close of the 14th c. not only was nearly all of Europe nominally Christian, but Mongolia, Tartary, Persia, and China had been visited and greatly influenced by bishops and friars sent out from the Roman Catholic church. The discovery of America in 1492 and the doubling of the cape of Good Hope opened the way for missions in new fields. The Spanish and Portuguese prosecuted their voyages of discovery, of traffic, or of conquest, taking with them missionaries authorized to effect the conversion of the natives. Mexico, Central and South America, and parts of India were among the countries thus visited. The institution, in 1530, of the order of Jesuits, who pledged themselves to go wherever the pope might send them, gave a great impulse to missions among

the heathen. In Brazil, Peru, and New Granada, Jesuits, Franciscans, Dominicans, and Augustinians vied with each other in civilizing the wild tribes. In Mexico and California, as well as in the Portuguese possessions in India, the Jesuits were equally diligent. The inquisition was resorted to not only to restore heretics but to enforce conversion. It has been common for the Roman Catholic church to shield itself from blame in this respect by saying that it gave over the incorrigible to the secular authorities for punishment; but it is well understood that the secular authorities were under the control and did the bidding of the church. It is believed that in these days the church of Christ is learning again the spirit of Christ, and that persecution, formerly not unknown in any sect of the church, will hereafter be left to heathen powers.

In 1608 the French established prosperous missions among the Indians of North America. In the 16th, 17th, and 18th centuries unsuccessful attempts were made to bring into the Roman Catholic church the Christian church of Abyssinia, which for more than 1000 years had maintained an independent existence. At last, in 1859, the king of Tigré in Abyssinia, with 50,000 of his subjects, united with the church of Rome. The Roman Catholics now have considerable missions in China, Anam, India, in Senegambia, Natal, and among the Gallas in Central Africa, in some of the islands in Polynesia, and among the Indians of North America.

In beginning an account of Protestant missions it is proper to allude to the sending of 14 pastors from Geneva by Calvin in 1555, at the request of Nicholas Durand, to join the colony of French Protestants whom he had persuaded to accompany him to Brazil. Durand joined the church of Rome, put to death three of the Genevan teachers, and drove others back to Europe, the Portuguese massacring the remaining colonists. In 1559 Gustavus Vasa of Sweden established a mission among his subjects in Lapland, which was maintained for some years. The Protestant settlers of New England had, according to their own account, for one of their aims in coming to this country, "above all, that of extending the Redeemer's kingdom in lands where Christ is not named." The charter granted to the Plymouth colony by the king recognizes this "worthy disposition" of the petitioners, and thanks God for the privilege of engaging in "so hopeful a work" as the "conversion of savages" to "civil society and the Christian religion." In 1621 elder Robert Cushman, writing to England, reports the Indians as favorably disposed to religion and humanity, and some of the natives giving evidence, living and dying, of conversion to God. The charter given by Charles I. in 1628 to the Massachusetts colony declares that "to win the natives of that country to the knowledge and obedience of the only true God and Savior of mankind and the Christian faith, in our royal intention and the adventurers' free profession, is the principal end of the plantation." The seal of the colony had as its device the figure of an Indian with a label in his mouth, on which was inscribed the Macedonian cry, "Come over and help us!" This object was kept in view, though the settlers were harassed by the hardships and struggles incident to their condition, and, as circumstances allowed, carried out in the lives of those first settlers, and it bore fruit in the Christian walk of converts. In 1643 Thomas Mayhew began labors among the Indians of Martha's Vineyard and Nantucket, and five generations of that family furnished pastors for the churches so gathered. In 1646 the legislature of Massachusetts passed an act for the propagation of the gospel among the Indians, and the same year the celebrated John Eliot began to labor among them. In 1649 the society for propagating the gospel in New England was formed in England, which aided in the support of Eliot, Mayhew, Bourn, and other missionaries among the Indians. A settlement of praying Indians was soon formed, and a church organized in Natick in 1661. Eliot traveled extensively among the Indians, and once preached the gospel to the famous king Philip of Pokanoket, who rejected it with disdain. He translated the Bible and other Christian books. His translation published in 1663 was the only Bible printed in America before the revolution. In 1675, through the labors of Eliot and others, 14 settlements of praying Indians had been formed, and 24 regular congregations, and there were as many Indian preachers. The converts adopted civilized and Christian modes of life, and became industrious and virtuous citizens. In 1733–45 Mr. Parks labored among the Indians of Rhode Island. They abandoned their dances and drunken revels, and crowded the places of worship. Sixty were received to the church. In 1734 Mr. J. Sargent, resigning the office of tutor in Yale college, labored with the Mohegans till his death in 1749. He found them "living viciously in miserable wigwams; he left them settled in a thriving town at Stockbridge with good houses." The great and good Jonathan Edwards labored 6 years among them. From 1734 to 1782 the Moravians labored with great patience and self-denial for the Indians in various parts of Pennsylvania, New York, and Connecticut. Of these missionaries count Zinzendorf, Christian Henry Rauch, and David Ziesberger are worthy of special notice. Many converts were made. From 1743–47 David Brainerd lived a martyr-life among them, teaching and converting many. The Rev. William Tennent, also John Brainerd, and a converted Indian, Samson Occum, and many others worked earnestly and successfully. The French and English war came, and the war of the revolution. The Christian Indians took no part in these, and were consequently suspected by each party of secretly sympathizing with their enemies. They suffered much from the belligerents, their settlements being broken up, their villages and farms destroyed. Reports of the work among the Indians excited great interest in England, and funds continued to be raised

for its advancement. Dr. Luesden informed Cotton Mather that the example of New England awakened the Dutch to seek to convert the heathen in their East Indian possessions. Referring to it, bishop Burnet says: "The church of England, moved by the example of the dissenters, whose labors they admired, formed the society for promoting Christian knowledge." Some members of this society in 1701 formed the society for the propagation of the gospel in foreign parts, which was sanctioned by William III. It began mission work in India in 1727, and has had missions in Delhi, Poona, Ahmednuggur, Kolapore, the Nizam's dominions, Bangalore, Cuddalore, Tinnevelly, Arcot, Madras, Madura, and Calcutta. The mission of this society in Tinnevelly district has had great success in recent years, 23,654, from July, 1877, to the end of June, 1879, having asked Christian instruction. In 1883 this society had 629 ordained missionaries, 1382 native catechists and helpers, 128,768 baptized persons, 28,540 communicants.

In 1705 Frederick IV., king of Denmark, sent Ziegenbalg and Plutschau to Tranquebar, on the Coromandel coast, to convert his heathen subjects. So averse were the natives to having foreigners acquire their written language that the king put their teacher in prison, and loaded him with chains. Ziegenbalg himself was imprisoned four months. Persevering amid great discouragements the converts at his death numbered 355. In 1711 the translation of the New Testament into Tamil was finished. Grundler, Schultze, and Dahl continued the work after Ziegenbalg's death; and the rajah of Tanjore, who had forbidden Ziegenbalg to enter his territory, was so won by their consistent lives that he threw open his kingdom to the gospel. The work was, however, retarded by the wars of the English and French between themselves and with the native princes; and the immoralities of European residents and travelers prejudiced both Hindus and Mohammedans against Christianity. In 1728 Schultze removed to Madras and formed the Vepery mission. In 1750 Christian Frederick Schwartz arrived in India. He labored 48 years at Tranquebar, Trichonopoly, Tanjore, and in Ceylon. During 10 years in Trichonopoly he baptized 1238. The simplicity and earnestness of his life won the confidence and respect of heathen and Mohammedan princes. The English government sent him to negotiate a treaty with the haughty and powerful Hyder Ali. Hyder had said: "Let them send me the Christian; he will not deceive me." When near death the rajah of Tanjore committed to his guardianship his adopted son and heir, Serfogee. Serfogee, when king, erected a monumental slab to the memory of Schwartz in the church where he had been wont to preach, in which groups of children and native men, and Serfogee himself, are represented as mourning his death, while he is depicted as looking at the cross.

In 1708 a Danish mission was sent to Greenland. In 1709 the Society for promoting Christian knowledge was formed in Scotland, and by it David Brainerd was sustained among the Indians. Through the influence of Hans Egede, Frederick IV., of Denmark, established a seminary at Copenhagen to train missionaries for Greenland. It was here that count Zinzendorf was first impressed with the duty of spreading the gospel, and when he returned to Hernhutt the Moravians seemed at once inspired with a wonderful zeal in the cause of missions. They looked upon it as the great business of the church, and claimed that every member should contribute to its support. One in 50 of the entire membership devoted themselves to labor in the foreign field. From 1732 to 1853 they had stations in the West Indies, Greenland, among North American Indians, and in Labrador, South America, Australia, and Thibet; and the whole number of missionaries engaged during those years was 2,300, exclusive of native assistants. In 1883 they reported 99 stations, 324 missionaries, 1575 native helpers, 26,901 communicants, 79,021 baptized adults, and an income of $98,640.

In 1789 William Carey, a Baptist minister, endeavored to reawaken in England an interest in the subject of missions. In 1792 the English Baptist Misssionary Society was formed, which sent Carey and Thomas to Calcutta. The East India company forbidding their going in the company's ship, they left it and went in a Danish vessel. Obliged for a time to support themselves by superintending an indigo factory, they preached and taught among the native employes and in the neighboring villages. Marshman and Ward also were sent, but, owing to the hostility of the company, were obliged to proceed to the Danish settlement at Serampore, where the Danish governor, who had previously enjoyed the ministry of Schwartz at Tranquebar, gave them and Carey also his protection. In 1816, 700 natives had been baptized, and 10,000 children had received Christian instruction. The same society in 1797 established a mission in Dingapore, another in 1804 in the Jessore district; also in Chittagong, in Dacca, in Barisal (where in 1873 there were 4,600 converts and 40 native teachers and preachers), in Agra, Allahabad, Benares, and Delhi. In the mutiny of 1857 two missionaries and their families at Delhi were massacred, but after the siege the mission was renewed, and made great progress. The society sent missionaries to the West Indies and Africa. The missions in Jamaica have become self-supporting since 1842. It has missions also in Norway, Italy, and China, and reported, in 1881, 70 European missionaries, 12 lay, 97 native ord., 274 evangelists, 112 stations, 38,397 church members, 172 teachers, 15,079 scholars, and an income of $303,612. The *General Baptists* formed a distinct society, sent a mission to Orissa, India, in 1822; in 1883 had 7 ord. Europeans, 19 European women, 22 native preachers, 1,175 communicants, 3,064 Christian adherents, and an income of $42,000.

The London missionary society was formed in 1795. Their mission in the Society islands, established 1797, was without apparent success until, in 1816, king Pomare II. embraced Christianity. In 25 years the islanders had relinquished idolatry and cannibalism, had learned to read, had made great improvement in social habits, and many of them lived the Christian life. French Catholic priests reached the islands, but were not allowed to remain. The islands were soon after this seized by the French government in the interest of the Roman Catholic missionaries. In 1807 this society sent Dr. Morrison, the first Protestant missionary, to China, who translated the New Testament and, with the aid of Dr. Milne, the Old Testament into Chinese. It established missions also in the Indian archipelago, in Mauritius, in Southern Africa, where Moffat for 52 years with great success taught Christianity and civilization, beginning in the kraal of Africaner and extending his labors to several native tribes, and where Livingstone began his unprecedented career as a missionary and explorer. Their missionaries sent in 1820 to Madagascar were the instruments of introducing Christianity there. They were expelled for a time, but the "praying ones," as the converts were called, continued to increase during their absence, notwithstanding a terrific persecution in which the queen is said to have slaughtered as many as 2,000 of her best subjects in a single year on account of their adhesion to Christ. After her death the missionaries were invited to return, and religious liberty was enjoyed. Half a million of people have renounced idolatry, and 60,000 have confessed Christ. In 1883 this great society had 152 ordained European missionaries, 383 ordained native ministers, 4,436 native preachers, 86,422 communicants, 313,727 native adherents, 101,317 pupils. Its missions are in China, India, Madagascar, Africa, West Indies, and Polynesia.

The Church missionary society was formed in 1799. Finding none in England to engage in the work, they for a time employed Germans. William Wilberforce was one of its warm supporters, and its first mission was naturally to the west coast of Africa. It had to struggle against the intrigues of the slave traders and a most unpropitious climate, but after the transfer of the colony to the government of England the Sierra Leone mission became stable and successful. Their mission in the Tinnevelly district has received great accession, within two or three years, 11,000 heathen having sought instruction preparatory to baptism in 1878. The society had in 1883, 181 stations, 222 European ord. missionaries, 49 lay and women miss., 9 Eurasians and 240 natives ord., 17 Eurasians and 3,075 native teachers and helpers, 37,443 communicants, 188,899 Christians baptized, 68,905 scholars. Income $1,126,157..

The Wesleyan Methodists engaged in mission work as early as 1786, when Dr. Thomas Coke went to the West Indies. In the conduct of missions there and in America he crossed the Atlantic 18 times. He died in 1813, on his way to the East Indies for the purpose of establishing a mission. His five companions of the voyage began a mission in Ceylon, which afterwards extended its labors to the continent. There was no regularly organized Wesleyan missionary society until 1817. It has since carried on missions in Spain, Portugal, Africa, India, China, Australia, in the Fiji islands, where "cannibalism, war, and murder ceased wherever they penetrated," and in the Friendly islands, where the once hostile tribes are united under the native convert king George, who is Christian preacher as well as king, and among the negroes of the West Indies, where they have been very successful. This soc. had, '83, 462 stations, 526 missionaries and assistant missionaries, 10,625 catechists, local preachers, and teachers, 91,276 full church-members, 103,801 scholars.

The church of Scotland formed a missionary society in 1824, and began its work in 1829 by sending Dr. Duff to Calcutta, who with his schools made a powerful impression on the native young men of that city. At the disruption of the Scotch church its missionaries joined the Free church. The State church of Scotland has missions at Calcutta, Madras, Sealcote, Darjeeling, and Bombay; income 1883, $140,112. It had 12 European and 4 natives ord,, 98 catechists, etc., 415 communicants. It had, 1883, 37 European and 13 natives ordained, 412 native helpers and teachers, 4,443 communicants, 14,541 scholars, and an income of $389,180. The United Presbyterians of Scotland had in 1883, 55 miss. and 8 medical missionaries in the West Indies, Spain, Old Calabar, South Africa, India, and China ; 11,519 communicants, and an income of $182,674. The Presbyterian church of Ireland had in India and China in 1883, 13 European and 10 natives ord., 50 helpers and teachers, evangelists, 370 communicants, 1,710 baptized natives, and an income of $54,505. Many other societies in Great Britain, local or limited in sphere, do very useful work.

The missionary interest in the United States during the 17th and 18th centuries had been expended in efforts to Christianize the Indians, and evangelize its own wide newly-settled regions. In looking for the origin of the foreign missionary work in America we find three young men in Williams college withdrawing one summer afternoon in 1807 to a retired field, telling each other their impressions concerning the condition of the pagan nations, and kneeling there to implore divine direction as to their duty. They converse privately with ministers on the subject, sometimes venturing to allude to it in a prayer-meeting. In 1810 they with others unite in an appeal to their "revered fathers" of the general association (Congregational) at Bradford, Mass., who, recognizing their impressions as a "divine intimation of something great and good in relation to the propagation of the gospel," proceeded to constitute the American board of commission-

ers for foreign missions. Its first missionaries to foreign lands were Newell, Judson, Hall, Nott, and Rice; all of whom were, on their arrival at Calcutta, ordered by the East India company to return in the vessels which brought them. Judson and Rice having on shipboard changed their views in regard to baptism, united with the Baptists and left the American board. Hall and Nott went to Bombay, and were ordered to return, but after much discussion and negotiation with the East India company and the home government were allowed to remain. Thereafter India was open to American missionaries. Newell on being sent from Calcutta went with his wife to the Isle of France, where she died. He went ultimately to Bombay. In the East Indian field the American board has since conducted with success missions in Ceylon, Ahmednuggur, Madras, and Madura. In 1817 the Rev. Cyrus Kingsbury commenced labor among the Cherokees. The work was extended to the Choctaws, Chickasaws, Creeks, Seminoles, Dakotas, Sioux, Ojibwas, Ottowas, Iroquois, Cayugas, Walla-Wallas, and Nez Perces. Between 1817 and 1860 the American board expended among the Indians $1,100,000, and the laborers employed were more than 500. Other societies have done much. The work has been greatly thwarted by successive removals of the tribes, the sale among them by government agents of intoxicating liquor, and prejudice awakened by the fraudulent dealings of white men. Yet some of these tribes are recognized as civilized communities, and compare favorably with the white people about them. Ten thousand of the Indians are members of Christian churches, and 75,000, including women and children, conform to the customs of civilized life. In some instances, while Christians were turning their thoughts towards foreign lands, events in those lands were preparing the people for the coming of missionaries. Vancouver in his four visits to the Sandwich islands had given the people some thoughts on the folly of idolatry, and had told them that missionaries would some time come to teach them, to whom they must listen. Kamehameha I. was so far influenced that in his last sickness he forbade the customary offering of human sacrifices. Reports reached the people of the cessation of idolatry in the Society islands and of the great improvement in the condition of those islanders. Five Sandwich Islands youths who had gone with American shipmasters to America were receiving a Christian education, and one of them had written to his father describing the advantages of the Christian religion. The people also had become restive under the restrictions of the *taboo* system, and had noticed that foreigners incurred no risk by their non-observance. The mother of the new king Liholiho first broke taboo, and many of the chiefs, and at length the king, did so also, and afterwards destroyed the idols. It was the presence of the Sandwich Islands youths in America that induced the American board to send a mission to those islands; and in 1820, when the people were breaking taboo and burning idols, the missionaries, wholly uninformed of these events, were on their way from Boston. They found a nation open to instruction. The details of the work among them are of remarkable interest, and those islands are now, in the usual sense of that term, a Christian people. There are now 12,360 members in 57 churches, most of them having native pastors.—In 1820 the American board began mission work in Turkey, sending Parsons and Fisk to Smyrna. In 1831 Goodell, having carried an Armeno-Turkish translation through the press at Malta, reached Constantinople. A succession of able laborers, male and female, have continued the work to the present time through numerous cities and villages of both European and Asiatic Turkey. In 1827 the Maronite patriarch, in his decree of excommunication against the missionaries, by which the people were forbidden to deal with them in any way, stated that "they are unwearied in their efforts;" that "they go about, manifesting a zeal in compassionating their neighbors;" that "they have opened schools and supplied instructors, all at their own expense;" that "in their outward works they appear as men of piety;" and that "the evil grows day by day." This truly, though inadequately, describes the work and the workmen for 60 years past; and though there has been much persecution, the results are equal to the work. Christopher R. Robert, a merchant of New York, erected a college in Constantinople and left property to sustain it. It has 250 students, of 13 nationalities. The native converts of Aintab have contributed largely towards founding a college which is in operation in that city. There are four theological seminaries in Marsovan, Kharput, Marash, and Mardin. Though the work has been directed chiefly towards the regeneration of various lapsed Christian sects, yet there is abundant evidence that indirectly thousands of Mohammedans have been convinced that there is a Christianity, which makes man kind and true, though it would be death to them to adhere publicly to it. They listen often to Christian preaching, their children attend the schools, and individually they sometimes show great enlightenment; but very few Mohammedans have dared to take a stand on the side of Christ. It is the view of the missionaries to "increase knowledge and conscience, to inculcate saving truth, to promote piety, and to leave forms and ceremonies, however vain and hurtful, to be disposed of by the people themselves when they should become Christians at heart." The trials and exposures undergone in caring for the sick and wounded during the recent Russo-Turkish war, and in distributing to the hungry in the famine, made a deep impression on the people. Throughout the Turkish empire, "despite oppression, misrule, and anarchy," says the last annual report of the American board, "the leaven of the gospel is doing its work." Of the agencies involved we may note the existence of 113 churches, with 7,700 members; nearly 500 pastors, preachers, and teachers; 30 colleges, seminaries, and high schools,

attended by 1500 youth of both sexes in nearly equal numbers; 300 common schools, with over 16,000 pupils; and an educational and religious literature amounting in 1884 to 11,000,000 pages.—In 1830 the rev. Jonas King entered the service of the American board as its missionary in Greece. He was already on the ground, having been sent by the ladies' Greek committee of New York with relief for the suffering in the struggle for independence. Dr. King preached the gospel in the parlor, in the street, in the school-room. He endeavored, through the teachings of the ancient Christian fathers, whom they revered, to lead the Greeks back to the simple truth of the gospel. He greatly improved the condition of the schools, translating school-books and providing slates and other aids, of which they had been destitute. His work was appreciated by parents and children, and in most cases by the government, but he was repeatedly brought to trial by the ecclesiastics, and often was in peril of his life. He, however, gained religious toleration for Greece. He was joined by the rev. Elias Riggs in 1833.—In Nov., 1835, rev. Justin Perkins and Dr. Grant, with their wives, reached Oroomiah for the purpose of laboring among the Nestorians of Persia. They were well received, bishops, priests, and deacons attending their schools, and inviting the missionaries to preach in their churches. Dr. Grant acquired great fame by his surgical skill, especially by successful operation for cataract, and gained access to wild mountain regions among Koords, where Christian travelers probably never had gone before. There are now 1152 members in the reformed Nestorian church, 18 ordained native pastors, 45 preachers, and 90 teachers and other helpers.—The mission to West Africa was commenced in 1834, the rev. J. L. Wilson and wife, with a colored woman, arriving at cape Palmas in that year, and from the first was undisturbed and effective. That to the Zulus in South Africa was begun in 1836. It met with many interruptions from sickness, death, and war. Its 15 native churches have had much to contend with, and some relapses into old customs are reported. Yet a good degree of desire is shown to make the gospel known to their heathen neighbors.—In Feb., 1830, the rev. Elijah C. Bridgeman, missionary of the American board, reached Macao, to establish a mission in China, and in 1834 was joined by Dr. Peter Parker. In 1835 Dr. Parker established an eye infirmary, which was supported wholly by foreign residents. With the exception of a few pupils under Dr. Bridgeman's instruction, it afforded for a time, through conversation and books, the only opportunity of making known religious truth. He had soon three Chinese students in medicine and surgery under instruction, and a hospital under his care sufficient for 150 patients. In four years he had treated 6,450 cases. This institution was favorably viewed by the government and gratefully appreciated by the people. Through it much Christian truth was dispensed. The treaty of China with the United States in 1861, known as the Tientsin treaty, stipulated "that the principles of the Christian religion are recognized as teaching men to do good, to do to others as they would have others do to them; any person, either citizen of the United States or Chinese convert, who, according to these tenets, peaceably teaches and practices the principles of Christianity, shall in no case be interfered with or molested." Thenceforth mission work was much extended in China. The American board has two great mission centers in China, the Foochow, Shanse, and the North China missions. It has 25 missionaries, 7 medical missionaries, 39 female assistants, and 25 churches. Of the missionaries of different names who travelled through the famine-stricken district in n. e. China bearing food to the hungry, five fell victims to their over-exertions. This self-sacrifice revealed the Christians, whom the Chinese had been taught from childhood to despise, in favorable contrast with their own mandarins. In one such district the people were led by this means to consecrate their temple to the Christians' God, and after destroying the idols, to present to the missionaries a deed transferring the temple legally and perpetually as a place of Christian worship. In July, 1837, Mr. King, of the house of Oliphant & Co., American merchants in Canton, accompanied by his wife and by Dr. Parker and Mr. Williams of the American mission, and taking with him 7 shipwrecked Japanese sailors, whom he wished to restore to their country, sailed for Yeddo. Approaching the town they were fired upon by the Japanese and obliged to retreat. The same reception met them at another port, and they relinquished for that time the attempt to open intercourse with Japan. The commercial treaties of 1854 and 1858 between Japan and England and America having prepared the way, and other societies of America, England, and Scotland having already entered some parts of Japan, the American board sent missionaries in 1869 to that field, and has now in and around Osaka, Kioto, Kobe, and Okoyama, "122 principal and out-stations, 93 churches, many of them self-supporting, with 4,987 communicants; twenty missionaries, 3 physicians, 30 female missionaries, and 94 native pastors, evangelists, teachers, and bible-women at work." A native missionary society is formed, and is very useful, and the native Bible-women do much good among the native women. The American board in 1884 had 21 missions, 79 stations, 747 out-stations, 151 American ordained missionaries, 10 physicians unordained, 259 American assistants, male and female, 142 native pastors, 362 native preachers and catechists, 1,010 school teachers 307 native helpers, 292 churches, 21,076 church members, 2,007 pupils in 50 colleges and high schools, 1,711 girls in boarding schools, 32,364 pupils in common schools. The whole number of pupils is 36,537.

The China Inland mission. Mr. J. Hudson Taylor having been for several years in China, returned to England impressed with the immensity of the Chinese population,

their deep spiritual needs, and the utter insufficiency of existing agencies for their evangelization. He sought without interfering with other enterprises to devise some way by which more could be accomplished. The Chinese inland mission was inaugurated by the sending of Mr. James Meadows from England to China in 1862. The principle adopted was that the missionary should go out without guaranteed support, trusting in God for what he might send. Mr. Meadows was followed by several others, and in May, 1866, by Mr. Taylor himself, taking his wife and four children, and accompanied by a party of thirteen new missionaries, "means having come unsolicited sufficient to meet the heavy expenses involved." They reached Chin-Kiang, a free port on the Yangtse-Kiang, in May, 1868, but were driven away by a mob, and their defeat became the "laugh of tea-house and restaurant." They removed to Yang Chau, a city of 300,000 people, reaching there June 1, and after a few weeks the whole party were near being burned alive in their own hired house by an infuriated mob, instigated by the literary class. Yet they were wonderfully preserved, notwithstanding the authorities of the town failed to succor them, and a few months later were in quiet possession of their premises in Yang Chau, "mobs and mandarins having found that they were ruled by principles more potent than the fear of mobs." These missionaries, accompanied by native helpers, and preaching and distributing Scriptures and tracts, have traversed 30,000 miles through new provinces. They had, in 1883, 1,100 church members, occupying 60 stations, and had about 102 native laborers engaged as colporteurs, evangelists, pastors, and Bible-readers. For the past 14 years the work was performed by unsalaried officers, but as correspondence became heavy, in 1875 one salaried assistant secretary was employed, and in 1876 another.

In 1858 the Reformed church, which till that time had co-operated with the American board, organized for itself the board of foreign missions of the Reformed church in America. It has very successful missions in China, India, and Japan; and in 1884 had 14 stations, 101 out-stations, 20 ordained American missionaries, 42 assistant American missionaries; 18 natives ordained, 2,340 pupils in day schools, 12 theological students, 2,952 communicants.

The American Baptist missionary union was formed in 1814, and at once assumed the support of Dr. Judson, who had been laboring in Rangoon, Burmah, since July, 1813. The early work in Burmah was greatly hindered by war, and the missionaries were inhumanly treated; but Dr. Judson was spared to do a great work among the Burmese and Karens, and Mr. and Mrs. Wade and many other earnest laborers have continued the mission with great success. The mission to the Telugus, begun in 1836, for many years alternated between success and failure, and again and again its relinquishment was proposed. In 1867 a remarkable work of prosperity commenced. The first church of Christ was organized by rev. Mr. Clough with 8 members, and in 8 years the number increased to 3,300. In 1876 came famine and afterwards cholera, and again famine, terrible, widespread and long continued The missionaries were made almoners of the government, and thus gained access to many hundreds of persons, to whom they spoke of Christ. In 1878, within a few months, 9,147 were baptized.—The mission to Siam was begun in Bangkok in 1833. In 1877 there were 6 churches, 418 members (mostly Chinese), 7 chapels, 2 ordained and 6 unordained native preachers. The Siamese government has not only proclaimed toleration, but decreed that no master or relative shall compel any Christian to do acts contrary to his religion, as worshiping spirits, feasting spirits, laboring on Sundays, only excepting the case of war and public business of importance. The Baptist union has missions in Greece, Africa, Arracan, Assam, China, and Japan, besides some countries of Europe. It had in 1884 41 stations, 194 American missionaries, 1,682 native preachers, 1,127 churches, 112,122 church members. Income, $328,527.

The Methodist Episcopal missionary society was formed in 1819. It has successful missions in India, China, Japan, Africa, Bulgaria, Mexico, South America, and some countries of Europe. It had in 1884 119 American ordained missionaries, 120 female American missionaries, 97 native ordained preachers, 1,657 other native helpers, 16,727 day scholars, and 10,277 church members.

The Protestant Episcopal missionary society was organized in 1821. For some reason no mission was established till 1830, when the revs. J. J. Robertson and J. W. Hill, and Mr. Bingham, a printer, were sent to Greece. It has now missions in Greece, Western Africa, China, Japan, Hayti, and Mexico. In 1884 it had 141 stations, 1 American and 3 native bishops, 53 American and native priests and deacons, 3 physicians, 190 lay workers, bible-readers and helpers, 2,217 pupils in boarding and day schools, 2,799 communicants.

The Presbyterians had since 1741 done missionary work, mostly among Indians, under different organizations, which in 1831 were merged in the board of foreign missions of the Presbyterian church. Its first mission was to Liberia, where unusual obstacles presented themselves in climate and the character of the people. It is still continued; also the missions at Gaboon and Corisco. In 1833 the rev. Messrs. Reid and Lowrie were sent to Lodiana in the far interior of India. Sickness and death weakened the mission, but it was reinforced, and useful native laborers have been raised up. That mission has now 10 stations. Their mission to Furruckabad, where Freeman and

Campbell, with their wives, were murdered in the Sepoy rebellion, was commenced in 1838, and has 7 stations. The Kolapore mission, which was begun as independent by the rev. R. G. Wilder, and has passed into their hands, has 3 stations. The converts—Mohammedans, Sikhs, and Hindus—have in some instances suffered great privations and persecutions. On occasion of the reuniting of the Old School and New School general assemblies, the Presbyterian board received an accession to its membership of the New School members of the American board (thus left entirely to the Congregational churches), and at the same time, in amicable transfers, the missions of that board in Syria, Persia, West Africa, and among the Seneca Indians of New York. Those missions have since been reinforced by the Presbyterian board. It has missions also in Siam, China, Japan, Brazil, Chili, the United States of Colombia, among the Indian tribes, and the Chinese of this country. In 1884 it had: ordained American missionaries, 163; ordained native missionaries, 108; licensed native missionaries, 143; American lay missionaries, male and female, 312; native lay missionaries, 746; communicants, 19,897; pupils in boarding and day schools, 25,914.

The Evangelical Lutherans began foreign missions in 1841. They had in 1884 in India and Africa 9 ordained European missionaries, 4 ordained native missionaries, 235 native assistants, 3,096 communicants, 8,089 baptized converts, and 3,906 scholars. The Seventh-day Baptists began in 1842, and have small missions in West Africa and China. The Baptist church, South, began mission work in 1845, and has missions among the American Indians, and in Italy, Africa, and China. The United Presbyterian church, from its organization in America in 1858, has had missions in Syria, Egypt, India, and China. The Presbyterian church, South, was organized separately in 1861, during the rebellion; and in 1884 had 23 missionaries, 56 native laborers, 1,750 communicants, 545 pupils, and an income of $70,167.

At the period when the subject of slavery was kindling intense feeling and heated discussion throughout the United States, some of the missionary societies sought to avoid being involved in those controversies as foreign to their objects, while some friends of the cause thought it impossible to maintain neutral ground. This led to separate organization.—The Free Baptist missionary society was formed in 1843, sending a mission to Hayti; and the American missionary association in 1845. The Union missionary, the committee for the West India mission, and the Western Evangelical missionary association, joined the American missionary association, taking with them their missions in West Africa, in the West Indies, and among the North American Indians. This society, now mainly in the hands of the Congregational churches, has operated in Siam, the Hawaiian Islands, and also among the Chinese of California. The work in the Mendi mission and among the Chinese has been very successful. Since the slaves were emancipated, it has been chiefly occupied with a great work among the freedmen of the former slave and border states. It had in 1884 117 missionaries, 328 teachers, 95 churches, 6,691 church members, 71 schools, 12,819 pupils.

The American and foreign Christian union resulted from the union in 1849 of the Foreign Evangelical, American Protestant, and Philo-Italian societies. It has labored in Italy, Belgium, Sweden, Canada, Hayti, South America, and Mexico, and five years after its organization numbered 140 missionaries, half of whom were ordained. Denominational societies having become interested in the work, the union has transferred much of its work to them, and turned its attention more to our own country. It is still aiding the work of foreign evangelization, especially in France and Spain. In 1815 a seminary for the training of missionaries was founded at Basel; and in 1821 the evangelical missionary society was formed there, which employs in Africa, India, and China 98 European missionaries, 50 female missionaries, and 210 native laborers, and has 3,718 communicants. France, since 1822, has had a missionary society, with a mission among the Basutos of s. Africa, which has occupied 17 stations, has 69 native helpers, and 2,000 communicants.—In 1824 the Berlin missionary society was formed, and had in 1883 in southern Africa 59 missionaries, 8,060 communicants.—The Rhenish missionary society was founded in 1828.—In 1836 the evangelical Lutheran missionary association of Leipsic was founded, and in 1854 the Hermansberg society was organized, which has 172 preachers and helpers, 32 ch. mem.—There is also Gossner's mission union, founded in 1836 by Papa Gossner, as he was called, at 70 years of age, largely with his own resources. Its most interesting station is in and near Chota Nagpore, among the Kohls. The first convert was baptized in 1850, and in 1857 there were 800 converts. In the Sepoy rebellion they were hunted from their homes, their chapels were unroofed, and a price set on their heads. Those who survived gradually found their way back, rebuilt their huts and chapels, and in 1863 numbered 3,400. In 1883 there were 12,500 church members, 20 ordained preachers, 205 helpers.—The Friends' missionary society began their work by sending Rachel Metcalfe to India in 1866. This mission has been reinforced, and has now 11 members and 4 native teachers and catechists. In 1867, in response to an appeal from Mr. Ellis of the London missionary society, they sent Mr. Sewell to Madagasgar, where they had assigned to them one of the 9 churches of the metropolis, with the work in a district 70 m. long, 35 m. wide. They had in 1883, 16 men, 19 women, 49 natives,

3,872 ch. mem. 8,095 pupils. When Mr. Sewell went there the majority in the district still trusted in their idols, but in two years had destroyed them all. In Syria also they are doing good work. These missions, though ascribed to English Friends, are largely aided in men and means from America. The American Friends have a mission in Mexico.

The first woman's missionary society in America, of which we find record, is the Boston female society for missionary purposes, organized Oct. 9, 1800, which was a union of Congregationalists and Baptists. After this they became common in many parts of the country. All of these societies simply *earned, collected,* and *transmitted* money for the use of the general societies. As in the progress of missions it became evident that the hostility of heathen women was a great obstacle to success, and as in many heathen countries, especially in India, they were unreached by the usual missionary agencies, it was felt that more direct efforts than had yet been made for their conversion, were necessary. Missionary women returning told to Christian women the dark and hopeless story of their sisters in India, and they longed to do more for them than had been done. It came to be believed by some that if women had the selection of their own agents, and the management of their own funds; if they originated their own methods, and arranged their own work, more would be accomplished than by the old methods. They at first desired to avail themselves of the acquired wisdom and experience of the older societies by some kind of co-operation, but their plans did not at that time meet with favor from existing boards. They therefore organized independently the woman's union missionary society. It was incorporated in New York in 1861. From the first it has been undenominational. Its higher officers have thus far performed their duties without remuneration. The number of missionaries employed since the formation of the society is 101; the number now in the field, 45; the present number of schools is 80: zenanas taught, 473; pupils in 1884 were 3,025. The largest annual collection was $54,207. Total receipts to May, 1885, 774,954. It has auxiliaries in 20 states. Various denominational woman's boards have since been formed, as the woman's board of missions, Congregational, in 1868; ladies' board of missions, Presbyterian, 1868; woman's board of mistions of the interior, Congregational, 1868; woman's foreign missionary society, Presbyserian, 1870; woman's foreign missionary society of the Methodist Episcopal church, 1869; woman's Presbyterian board of missions of the northwest, 1870; Baptist ladies' missionary society, 1871; and many others. The total receipts of all such societies, as reported from the formation to 1885, reached about $5,000,000. It is impossible in the nature of the case to furnish statistics of results of this work. There is evidence, however, that is useful and successful beyond anticipation, and that through it many women in India are receiving that enlightenment and blessing which ever follow the knowledge of the Lord Jesus Christ.

There are computed to be from three to three and a half million converts. The Protestant missionary societies of the world number 70. The missionaries in various fields supported by Protestants number about 5,000. With very little exception, all the Protestant societies have carefully avoided interfering with each other's work, or entering each other's fields, and in many instances where their fields were adjacent there has been a delightful spirit of concord and mutual helpfulness.

Some striking facts connected with the progress of the gospel in the world may be mentioned here. A Christian lady of Calcutta, the wife of an English officer, had long desired to benefit the native women. It happened one day that a native of rank, a former pupil, visiting at the house, saw and greatly admired a pair of beautifully embroidered slippers which the lady had completed for her husband. The lady offered to teach his wife to do such work if she might go to her. She allowed him to take home the slipper and consult the mother-in-law. Permission was granted her to go and teach the wife not only to sew, but to read, and ultimately to read the Bible. This is the door through which has been introduced the whole system of zenana missions in India. The missionary ladies heretofore excluded are now admitted to the private apartments of thousands of the women, and their instructions are bearing cheering fruit in many hearts. Before the first Protestant missionary went to China in 1807 it was thought impossible for a foreigner thoroughly to acquire the Chinese language. Nevertheless, not only has the Bible been translated into three Chinese dialects, but a variety of useful books, as dictionaries, geographies, books on medicine, jurisprudence, etc., have been so translated as to be acceptable to intelligent Chinese, and some have been reprinted by them. At Shanghai alone the mission press issues 18,000,000 pages annually. The interior of Africa had for hundreds of years foiled the attempts of the very martyrs of science to penetrate it. Livingstone, fired with desire to open Africa to the gospel, and if possible to stop the fountains of the slave-trade, unlocked the regions so long closed. The results of his daring might have been partially or wholly lost had not Stanley followed him and brought report of a native king willing to listen to the gospel. Now all Christendom is combining for the conversion of the central portions of the dark continent, and at least five societies have sent missionaries to different posts in that region. The formation of a society of intelligent Hindus, the Brahmo Somaj, who reject idolatry and assemble for the worship of a supreme being, indicates the working of the leaven of Christian truth. Its former leader, Kesub Chunder Sen, said of India, "Native society is being roused, enlightened, reformed under the influence of Chris-

tianity." Sir Bartle Frere, who spent 30 years in India, said, "The teaching of Christianity among 160,000,000 of Hindus and Mohammedans is effecting extraordinary changes in India. The experience of a few more years will demonstrate the fact that the missionary enterprise is incomparably the most effective machinery that has ever been brought to operate upon the social, the civil, and the commercial interests of mankind." The last 15 years have witnessed a greatly increased success in missionary work. Missions have often been declared a hopeless toil; but if the recent rate of advance be maintained, the time will be not so remote as one might think who gave the subject only hasty thought, when the last heathen nation shall have heard the gospel.

MISSISQUOI, a co. in s. Quebec, having the state line of Vermont for its s. boundary, and the n. portion of lake Champlain, called Missisquoi bay, and the Richelieu river for its s.w. boundary; 560 sq.m.; pop. 17,784. It is traversed in the extreme e. by the Southeastern and Montreal railway, which in the extreme n. forms a junction with the Stanstead, Shefford and Chambly, and the Chambly and Sorel railroads. The Central Vermont railroad crosses the extreme s.w. section on the shore of the lake. Its county seat is a port of entry. It has saw and grist mills, and beds of iron ore, brickyards, and manufactories of various kinds. Capital, Frelighsburg.

MISSISSA'GAS, a tribe of Indians belonging to the Algonquin nation, who, when first known by the whites, lived n. of lake Huron on a river since called by their name. After the defeat of the Hurons by the Iroquois, they moved to the region of lake Superior, but after a few years returned. Until the French and Indian war broke out they were constantly engaged in warfare with the Sioux, and were driven eastward to the Thousand islands. At first friendly to the French, they were in 1746 gained over by the Six Nations, and for a time sided with the English; but in the second war, feeling themselves ill-treated by their white allies, again joined the French; when the Pontiac war began they once more assisted the English, but in the Miama war (1792) and in the war of 1812 showed themselves hostile to the Americans. For a short time they lived near the present site of Erie, but have long been settled in Canada, occupying four villages in Ontario. Missions were established among them as early as the latter part of the 17th c., but only within the last 50 years has Christianity made much progress among them. They are now, however, well advanced in religion and civilization, till the land, live in houses, and have schools. They number between 500 and 1000.

MISSISSIPPI, one of the south-western states, lies in lat. 30° 13′ to 35° n., and long. 88° 7′ to 91° 41′ west. It is 332 m. from n. to s., and from 78 to 118 m. from e. to w., containing an area of 47,156 sq. miles. It is bounded n. by Tennessee, e. by Alabama, s. by the gulf of Mexico and e. Louisiana, and w. by the rivers Pearl and Mississippi. The state also includes a cluster of islands in the gulf, of which the principal are Horn, Deer, and Ship islands. There are 74 counties. The principal towns are Jackson (the capital), Natchez, Vicksburg, and Columbus. There are 88 m. of sea-coast, but no good harbors. The surface is undulating, and generally very fertile, with river-bottoms of great productiveness. The sea-coast is sandy, but well timbered with live oak, magnolia, and pine, and is considered one of the most healthy districts in the world. The state borders for 500 m. on the Mississippi, and is drained by its tributaries, the Yazoo, Black, Sunflower, etc., and by the Pearl and Pascagoula, flowing into the gulf of Mexico. The country is of the tertiary and upper secondary formations, with great alluvial valleys; the climate, semi-tropical; the chief productions: cotton, sugar, maize, wheat, sweet potatoes, peaches, figs, oranges, etc. In its forests are found the deer, puma, bear, wolf, wildcat, paroquets, wild turkeys, and pigeons, with fish and alligators in the rivers. The state is well provided with railways, and has immense wealth and resources. Mississippi had in 1870 a population of 827,922. It has the largest cotton-growing area in the union; in 1877 no less than 2,055,000 acres. In 1877 the state debt was $2,954,458; the income was $865,327. Mississippi has a university, four colleges, and many benevolent institutions. This region was traversed by De Soto in 1542. La Salle descended the Mississippi in 1682, and claimed the country for France; in 1698 M. d'Iberville formed settlements on the coast at Ship island and Biloxi. Natchez was settled in 1700; but in 1728 this settlement was destroyed by the Natchez tribe of Indians, who were afterwards defeated, and the survivors sold into slavery in St. Domingo. Mississippi was admitted to the union in 1817; it seceded in 1861, and joined the southern confederacy. In 1869 Mississippi agreed to the new constitution, and was restored to its place in the union. In 1863 the city of Vicksburg, after a long and gallant defense, was forced, by famine, to surrender to gen. Grant; and Jackson, the capital, was taken and partially destroyed by the federals, and some of the finest regions of the state laid waste.

MISSISSIPPI (*ante*). In 1539 Fernando de Soto, with a band of Spanish adventurers, penetrated into that part of the state now known as the Great Yazoo bottoms, remaining more than a year. It was not until 1673, a hundred and thirty-two years later, that the French explorers, Joliet and Marquette, passing down the Mississippi river, landed at several places within the limits of the state. In 1682 De la Salle and the chevalier de Tonti made their appearance among the Natchez Indians, and remained for some time. It was not, however, until 1699 that the first attempt to found a colony was made by Iberville, who brought 200 immigrants from France to the eastern shore of the bay of Biloxi. The place was called Biloxi, and it was the germ of the subsequent settlement

of New Orleans and of the dominance of the French in that quarter. Iberville, after returning to Franee, came back in 1716 with Bienville and the ehevalier de Tonti, a large body of immigrants, and a military foree, and aseended the Mississippi to the present site of Natchez, where they founded a colony named Rosalie, in honor of the eountess of Pontchartrain. It flourished for a little while, but in 1718 it fell with the whole region under the sway, for a time, of the Seotch speculator, John Law. Afterwards, when the "Louisiana bubble" had burst, the whole territory of Orleans fell into the hands of the Company of the Indies, and the small colonies in Mississippi grew but slowly. Bienville, the governor of the provinee, was so fortunate as to keep on good terms with the powerful Indian tribes, but his successor, Perrier, ineurred the hostility of the Choctaws, and a eonspiracy was formed by that tribe with others to expel the Freneh from the whole region. The attaek was made first upon Rosalie, Nov. 29, 1729, but the other settlements were assaulted nearly at the same time. At fort Rosalie 200 persons were killed, and more than 500 taken prisoners, while in the smaller settlements many were tortured and ruthlessly butehered. But a swift retribution followed. The Freneh commander at New Orleans pursued the Indians to their strongholds, killed many, destroyed mueh property, released the eaptives, and took 427 prisoners, among them several ehiefs. These prisoners were sent to San Domingo and sold for slaves. The Company of the Indies having abandoned the territory to the king of France, Bienville, in 1733, was again made governor. He found the colony at war with the Chiekasaws, and the eonflict continued several years. Then there was a peace, followed in 1752 by another Indian war, instigated, it was said, by English adventurers. The French commander sought to retaliate, but without much success. In 1763 the whole region was ceded by Franee to England, after which immigrants flocked thither in considerable numbers from the English colonies on the Atlantic coast. In 1798, the United States having succeeded to all the rights of the English in this region, the territory of Mississippi, embraeing all the region between the 31st and 35th parallels, was organized. In 1811 the portion of Mississippi below the 31st parallel, being a portion of the Louisiana purchase, was added to the territory. In 1817 Alabama was set off from Mississippi, and the latter was admitted to the union as a state in Deeember of that year.

A broad, low ridge, running nearly n. and s. through the eenter of the state, divides the waters flowing into the Mississippi from those which find their way to the Atlantic through other ehannels. This ridge has a lateral extension westward to Vieksburg on the Mississippi, where it terminates in high bluffs. The country east of this water-shed consists of broad, gently rolling prairies, whieh produce heavy erops of cotton and corn; while on the w. the land is broken into valleys and ridges, extending at right angles from the longitudinal ridge, and falling gradually off to the great basin of the Yazoo delta, a region embraeing 4,000,000 acres of the very best cotton land in the state. The land in the central ridge, which is partly cultivated and partly eovered by heavy forests, is rolling, and of a lighter, but yet productive, surfaee soil on a elay foundation. The s.e. corner of the state, below the railroad from Meridian to Jackson, is a rolling, sparsely settled country of open pine woods, stretching down to the Mexiean gulf, and valuable mainly for pasturage, timber, and turpentine. There is not a mountain in the state, and the highest ridge has no elevation of more than 800 feet. The Yazoo basin, with an exception of some 200,000 acres, is subjeet to overflow at times of extreme high water. The valley areas of the n. section are fertile, while those of other parts of the state are often of an inferior quality. The bottom-lands in some cases are elayey and wet, and portions of the prairies are not very fertile.

The state is well watered. The Mississippi forms the whole of its w. boundary, and into it flow the Homoehitto, Big Blaek, Yazoo, and its tributaries, the Sunflower and the Tallahatchie. On the e. side of the central water-shed are the Pearl and its branches and the Pascagoula and Tombigbee, with their affluents, all of whieh flow at last into the gulf, on whieh the state has a coast line of about 90 m., with no good harbor exeept that of Ship island. In the extreme n.e. corner the boundary for 15 m. is the Tennessee river, into whieh flow several small streams. The principal ports on the Mississippi are Vicksburg and Natehez.

The mineral deposits are not of much value. In the tertiary formations eoal is found in small quantities, with mineral fertilizers of some value, fire-brick and potters' elays, limestone, ete. Iron is found in some places, but nowhere in quantities to be of praetical worth. The principal fossil found in the prairie region is a marine animal more than 100 ft. long, resembling the alligator. Mineral and medieinal springs are of frequent occurrence, that of Cooper's wells being the most important.

The summers are long and hot, but not unhealthful, save in the low bottom-lands. The winters, which of course are short, are somewhat damper and colder than on the coast. From Oetober to June the climate is delightful. The highest temperature of the summer is 90°; the lowest of winter 18°. The mean annual temperature at Vicksburg varies from 64° to 67°.

A large portion of the state is covered with primitive forests. The prineipal deeiduous trees are numerous species of oak, hickory (four species), black walnut, butternut, dogwood, black and sweet gum, beeeh, sycamore, cottonwood, red maple, ironwood, loeust, papaw, and black and white mulberry. The principal evergreens are the pine (several species), the cypress, and the live oak. The fruits most cultivated are apples (in the n.e.

part of the state), grapes, peaches, pears, quinces, apricots, and plums; in the southern counties, figs, lemons, oranges, and bananas.

In the forests wild animals abound; among them wolves, bears, foxes, wildcats, panthers, raccoons, opossums, deer, rabbits, hares, squirrels, gophers, etc. Wild-turkeys, pigeons, quails, rice-birds, mocking-birds, and wild-ducks are found in great numbers. Hawks, vultures, and gulls, and birds of gay plumage are numerous. Alligators haunt the bayous of the Mississippi, and lizards and water-snakes are found in the swamps and bottom-lands. Rattlesnakes and moccasin-snakes, as well as a great variety of harmless reptiles, abound. Mississippi sound and the various rivers contain a great variety of edible fish. Oysters and other shell-fish are found in Mississippi sound.

Cotton and corn are the great agricultural staples, though wheat and oats do well in the upland regions. Excellent pasturage, with roots for swine, is found in the low-lands and in the river valleys. According to the census of 1880 there were 13,813,000 acres of land in farms, of which 4,895,000 acres were cultivated, while 8,918,000 acres were unimproved. The cash values of farms was $92,844,915, of farming implements $4,855,636. The estimated value of all farm products for the year was $63,701,844. Among the products in 1880, were: sweet potatoes, 3,610,660 bush.; tobacco, 414,663 lbs.; rice, 1,718,951 lbs.; molasses, 536,625 galls.

Among the products in 1883 were: rye, 5,347 bush.; Irish potatoes, 518,049 bush.; hay, 13,643 tons. Products in 1884: corn, 25,510,000 bush.; wheat, 237,600 bush.; oats, 3,048,000 bush.; cotton, 847,000 bales. The production of cotton and of cotton manufactures was greatly stimulated by an act of the legislature in 1882, exempting from taxation for 10 years, machinery used for the manufacture of cotton and woolen goods, yarns, or other fabrics composed of these or other materials, or for the making of all kinds of machinery or implements of husbandry, or all other articles not prohibited by law. There were in 1883 not less than 14 cotton and woolen factories. Many mills for the extraction of oil from cotton-seed are in operation. Wine making is successfully engaged in, as well as the culture of jute. In 1880 7,317 acres of amber cane were planted, and the area has since been largely increased.

Within the last few years a new industry, that of raising early fruit and vegetables for the Chicago and other north-western markets, has sprung up. The center of this industry is at Crystal Springs, where the soil and climate are peculiarly favorable for the purpose. Already the trade has become profitable, and it will probably be much extended in future. The agricultural department at Washington estimated the number of live stock in 1884 as follows: horses, 120,924; mules, 139,058; milch cows, 274,829; oxen and other cattle, 420,499; sheep, 293,477; hogs, 1,517,296; total value of live stock, $30,888,005. The acres of timber land in the state are estimated at about 20,000,000, largely covered with long, and short-leaved pines. One of the greatest impediments to the agricultural prosperity of the state is the frequent inundation of its alluvial lands by the overflow of the Mississippi. This can be prevented only by the construction of costly levees. Mississippi and Louisiana expended millions of dollars for this purpose; but the work was too extensive for their resources, and in view of the national importance of the Mississippi as a channel of commerce, congress is providing for its accomplishment at the nation's expense. Mississippi is not, to any great extent, a manufacturing state, though its natural facilities therefor are great. In 1880 there were in the state 1,479 manufacturing establishments, mostly small, employing 5,827 persons, using $4,727,600 of capital, paying $1,192,643 in wages, and producing goods valued at $7,495,802. There were 295 saw-mills producing lumber valued at $1,920,335; 6 planed lumber mills, with products valued at $71,350; and 525 flour and grist mills with products valued at $1,762,523.

There were within the state in 1884, 751 m. of railroad (341 of which were operated), with an aggregate capital of $22,741,923. Railroads constructed in the years 1883–1893 are exempted from taxation. The assessed amount of property in 1883 was $126,754,927. The debt of the state in 1883 was $2,965,282, or, deducting the amounts due the Chickasaw and common school funds, and the cash balance in the treasury, the debt Jan. 1, 1884, was $331,725. The receipts for 1883 were $746,864; disbursements, $836,499; assessments of property for taxation throughout the state are unequal. Over 1,000,000 acres forfeited for non-payment of taxes were offered for sale in 1882.

The state has three customs districts—Natchez, Pearl River, and Vicksburg. The direct foreign trade and the coasting trade are carried on entirely in the Pearl River district, of which the only port is Shieldsborough. The amount of foreign commerce in 1882, consisting mainly of exports, was $535,534; the number of vessels engaged in that trade was 100, aggregating 56,405 tons, and 116 aggregating 59,429 tons. There were in 1884, 165 vessels aggregating 8,967 tons, belonging to the state. The exports are mainly cotton and lumber. Lines of steamers connect Vicksburg with New Orleans and St. Louis. The latter city receives a large proportion of the fruit and vegetables raised in Mississippi.

There were four national banks in 1884, with capital of $225,000; in 1882, 17 state banks and trust companies had a capital of $614,590, and 11 savings banks, a capital of not far from $423,615.

According to the census of 1860, the population of the state was 791,305, of which 353,899 were white, 436,631 slaves, and 773 free colored. The slaves having been emancipated in suppressing the rebellion, the population of 1870 was 827,922, of which 382,896 were white, and 445,026 (including 16 Chinese and 809 Indians) were colored;

males, 413,421; females, 414,501; natives of the country, 816,731; persons of foreign birth, 11,191; persons of school age (5 to 20 years), 278,999; voters, 174,845. Pop. '80, 1,131,592; colored, 650,291.

The constitution of the state at the time of its admission to the union recognized the need of a good common-school system, and congress was asked for an appropriation of public lands to promote the object. Grants were accordingly made at different times, amounting in all to 10,697,882 acres, an amount equal to more than one-third of the area of the state. The proceeds of these lands, so far as they have been sold, have been mostly diverted from their legitimate object and lost by gross mismanagement. Indeed, before the rebellion there was no well-regulated system of common schools, or hardly an effort to secure such a boon, the policy of this as well as of the other slave states being unfavorable thereto. After the national troops gained a foothold in the state, northern benevolent societies began to establish schools, but they were attended mainly by the negroes. Appropriations from the Peabody fund and from the resources of the Freedmen's bureau were added to the contributions of the benevolent societies, and a beginning of a better educational system was made. After the state was reconstructed, the legislature enacted laws for the establishment of a common-school system, and since that time much has been done to carry those laws into effect. In 1878 an act was passed placing the schools under the management of a state board of education, a state superintendent, county superintendents, and local boards; providing that white and colored youth should not be taught in the same school-house, nor in school-houses nearer to each other than two and a half miles; that the Bible should not be excluded from the schools, and that the proceeds of land sold for taxes, from fines, forfeitures, breaches of penal laws, etc., should be set apart for the support of schools. Another act was passed making provision for a system of high schools. The ordinary school districts are counties; incorporated towns of 1,000 or more inhabitants may become separate school districts. From 1868 to 1882, the state received nearly $70,000 from the Peabody fund. The number of children in school, 1880, was 237,065, of whom 115,463 were white, 121,602 colored. Average daily attendance: whites, 76,225; colored, 80,599. Number of teachers, white, 3,290; colored. 2,243. Average monthly salary of teachers, $29.10. Total value school property, $553,610; receipts, $742,765; expenditures, 679,475; amount of available school fund, $800,000; number of illiterate persons, 753,693; number of private schools, 1882, 969. The state normal school is at Holly Springs; there is a normal institute at Iuka, and normal instruction is given at Natchez seminary (colored), Tougaloo university, Rust university (formerly Shaw university), and at Union female college. There are a Protestant Episcopal theological school at Dry Grove, and theological courses at Rust university, and Natchez seminary (Baptist). The university of Mississippi has a law department. The Agricultural and Mechanical college at Starkville county gives free tuition to students from the state. The university of Mississippi at Oxford has classical, scientific, and law departments; while Alcorn university (colored) at Oakland has scientific and agricultural departments. There are, besides, Mississippi college (Baptist) at Clinton, Pass Christian college (Roman Catholic) at Pass Christian, Madison college at Sharon, Tougaloo university (unsectarian, but under Congregational auspices) at Tougaloo, and Rust university (Methodist) at Holly Springs; and not less than 11 colleges and seminaries for the instruction of girls, mostly under the patronage of different Christian sects—Methodist, Presbyterian, Baptist, Cumberland Presbyterian, and Episcopal.

The state has an institution for the deaf and dumb, and another for the blind, near Jackson, the capital. There are two orphan asylums at Natchez, both under Roman Catholic control, and there is a soldiers' orphans' home for children of confederate soldiers near Lauderdale Springs. The state hospital for the insane and the penitentiary are at Jackson.

According to the census of 1880 there were in the state 123 newspapers and periodicals, of which 5 were daily, 5 tri-weekly, 1 semi-weekly, 109 weekly, 3 monthly.

The number of church organizations in 1870 was 1,829, of church edifices 1,800; value of church property, $2,360,800. The principal denominations are: Baptists, Christians, Cumberland Presbyterians, Episcopalians, Lutherans, Methodists, Presbyterians, Roman Catholics, and Universalists.

The state is divided into 74 counties. The governor, lieutenant-governor, and other state officers, are elected for a term of four years: and the legislature, meeting biennially, is composed of a senate and house of representatives—the members of the former elected for four and those of the latter for two years. The supreme court is composed of three judges, appointed by the governor, by and with the advice and consent of the senate, for a term of nine years. The circuit court is composed of 15 judges (corresponding with the number of judicial districts), appointed by the governor, by and with the advice and consent of the senate, for a term of six years. The judges of the court of chancery, 20 in number, are appointed by the governor for four years. The salaries of the supreme court judges are $4,500 each; those of the circuit court judges are $3,500, and those of the chancery court judges $3,000. Women can hold the office of notary public.

The electoral votes of Mississippi for president and vice-president of the United States have been cast as follows: 1820, 2 for Monroe and Tompkins, 1 vacancy; 1824, 3 for Jackson and Calhoun; 1828, 3 for Jackson and Calhoun; 1832, 4 for Jackson and Van Buren; 1836, 4 for Van Buren and R. M. Johnson; 1840, 4 for Harrison and Tyler;

1844, 6 for Polk and Dallas; 1848, 6 for Cass and Butler; 1852, 7 for Pierce and King; 1856, 7 for Buchanan and Breckinridge; 1860, 7 for Breckinridge and Lane; 1864, did not vote; 1868, 7 vacancies; 1872, 8 for Grant and Wilson; 1876, 8 for Tilden and Hendricks; 1880, 8 for Hancock and English; 1884, 9 for Cleveland and Hendricks.

MISSISSIPPI, a co. in n.e. Arkansas, having the Mississippi river for its e. boundary, separating it from the state of Tennessee, the river St. Francis and lake St. Francis for its s.w., and the state line of Missouri for its n. boundary; 900 sq.m.; pop. '80, 7,332—7,230 of American birth, 2,661 colored. It is drained by Little river, the Obion, and several lakes of considerable size, the largest being Big lake. Its surface is generally level, but diversified by cypress swamps, bayous, canebrakes, and thick forests. Its soil wherever tillable is fertile and adapted to the production of cotton and corn, stock raising being carried on to a limited extent. Capital, Osceola.

MISSISSIPPI, a co. in s.e. Missouri, having the Mississippi river for its e. and n. boundary, separating it from Kentucky; 370 sq.m.; pop. '80, 9,270—9,020 of American birth, 2,141 colored. Its surface is generally level, diversified by sloughs and low swampy sections covered with a thick growth of cypress trees, and having small lakes, and James and Cypress bayous in the s. section. The soil under cultivation produces wheat, oats, Indian corn; pork is among the staple products, and horses, cattle, sheep, and swine are raised. It is intersected by the Cairo and the Belmont divisions of the St. Louis, Iron Mountain and Southern railroad, centering at its co. seat, and it contains in the s.e. section the town of Belmont, the first battle-field on which gen. Grant had chief command. Capital, Charleston.

MISSISSIPPI RIVER (Indian, *Miche Sepe*, Great river, literally, Father of Waters), a river of the United States of America, the principal river of North America, and, including its chief branch, the Missouri, the longest in the world, rises in the highlands of Minnesota, in a cluster of small lakes, and near the sources of the Red river of the north, and the rivers which flow into lake Superior, in lat. 47° 10′ n., long. 94° 54′ west. Its sources are 1680 ft. above the gulf of Mexico, into which it enters. Its general course is southerly, with numerous windings, giving it a length of 2,986 m. to its mouths, in lat. 29° n., long. 90° w., from which, to the source of the Missouri, is 4,506 miles. The Mississippi and its branches drain an area of 1,226,600 sq. miles. It is navigable to the Falls of St. Anthony, 2,200 m., and by smaller boats above the falls; or by the Missouri, 3,950 m., and has 1500 navigable branches, the chief of which are the Red river, 340 m. from its mouth; the Yazoo, 534 m.; the Arkansas, 700 m.; the Ohio, 1053 m.; the Missouri, 1253 miles. The Mississippi river forms a portion of the boundaries of ten states, having the southern part of Minnesota, Iowa, Missouri, Arkansas, and most of Louisiana on the w. bank; and Wisconsin, Illinois, Kentucky, Tennessee, and Mississippi on the east. The chief towns situated on its banks are New Orleans, Natchez, Vicksburg, Memphis, St. Louis, Quincy, Keokuk, Galena, St. Paul. The upper Mississippi, above the junction of the Missouri, flows through a picturesque and beautiful country. The great lower valley is 500 m. long, and from 30 to 50 wide. The delta, through which flow its numerous bayous, is 150 m. wide. The alluvial plain through which the river winds has an area of 31,200 sq.m., and the delta 14,000 sq.m., all of which, except a few bluffs, is protected by levees, or embankments, from frequent inundations. The descent of the plain is 320 ft., or 8 in. per mile. The river at high water is higher than the plain, and the banks higher than the swamps of the interior. The great floods rise 40 ft. above low water at the head of the plain, and 20 ft. at New Orleans, and for the whole distance the river averages 3,000 ft. wide, and is from 75 to 120 deep. There is no apparent increase from the largest branches, and it is estimated that 40 per cent of the floods are lost in the great marshes. In '82, 75,000 persons were rendered destitute by a flood. Thousands of acres of land upon the banks are annually carried away by the current.

MISSISSIPPI RIVER (*ante*). The sources of this great river are lakes Itasca, Travers or Pemidgi, Cass, Winnebigoshish, Fishing, Leech, and Mud, lying among hills of drift and bowlders, in the midst of pine forests and marshes. From lake Itasca to Travers the stream is about 12 ft. wide and 2 ft. deep. It issues from the latter 120 ft. wide to Cass lake, which it leaves with a width of 172 ft., contracting and deepening below as it flows through marshes till it comes to a junction with Leech river, where it has rapids of 20 ft., called the falls of Pecagama, 270 m. from the source. To this point small steamers navigate. The total descent to this point is 324 feet. Thence to the mouth of Pine river, about 200 m., the river falls 165 ft.; thence to Crow-wing river 47 m., one ft. per mile. The river is narrow through this distance and winds through oak and maple forests, marshes, and sandy hills, where the natural formation of rock is overlaid with the gravel and bowlders of the drift period. Below, the river passes through a prairie country down to Elk river, and is stained slightly with the brownish color given by piney and marshy vegetation; 133 m. below the Crow-wing are the Sauk rapids one m. long, where the first regular formation of rock is seen on its banks. This is of the Potsdam sandstone, which extends from that point down to Dubuque and Rock Island. The falls of St. Anthony at Minneapolis are only 18 ft., with a breadth of 1200. Up to this point the river is navigable for commercial purposes, widening below from what is called lake Pepin, studded with many islands. From above the falls of St. Anthony to the junction with the Missouri, the river flows through a valley of great beauty and uniform

fertility. Cliffs and rocky bluffs, from 200 to 300 ft. high, give a picturesque character to that part of the valley below Rock Island, where its strikes the carboniferous strata, the geologieal formation of the valley, to about 100 m. below the Missouri. At Rock Island, 350 m. below St. Anthony, there is a fall of 22 ft., and the Des Moines rapids, 475 m. below St. Anthony's, have a fall of 24 ft. The government has constructed ship canals around these rapids, so that the navigation of the upper Mississippi is uninterrupted below the falls of St. Anthony. The junction of the Missouri is like the marriage of a rough impetuous uncouth man with a refined and graceful woman. The surging, muddy, eddying waters of the greater stream, the Missouri, for a long distance flow side by side with the elear waters of the Mississippi, joining but not blending, till thrown together by many a erook and turn and eddy between the bluffs of the great valley. Before the Ohio river joins, the union is complete; but the waters remain turbid to their junction with the sea, and, where joined by the eurrents of the Arkansas and Red rivers, take a more reddish color. Three m. above eape Girardeau and about 30 m. above the mouth of the Ohio, the river begins to have a surface above much of the adjacent land; and for 1300 m. to the sea it flows over a vast alluvial deposit of its own creation, below the surface of whieh its tortuous bed is deeply cut, while the top of its current is higher than the land.

The mean annual velocity of the eurrent below the junction of the Missouri is 3.39 ft. per second—about 2½ m. an hour. The average annual rain-fall in its basin is estimated at 30.4 in.; and the yearly discharge of water into the gulf of Mexico at 145 eubic miles. The depth of the channel below the mouth of the Ohio is from 75 to upward of 100 feet. The variation from lowest to highest water at Natchez, Vicksburg, and Cairo was formerly 52 ft., but is supposed to have been reduced to 46 ft. by new channels and levees. The sediment contained in the water below the Missouri is .0035 of its volume. The area of the delta of the river is estimated at 38,600 sq. miles. The entire valley of the river is margined by deltas, and considerable parts of Louisiana, Mississippi, and Arkansas are all delta. The bottom-lands above cape Girardeau, which are occasionally overflowed, but which are clearly above the level of the river at ordinary stages, are to be distinguished from those large tracts adjoining the lower part which lie below the surface of the river at all seasons. The former are almost continuous on one side of the river or the other, and generally on both sides, from the falls of St. Anthony to three m. below cape Girardeau, where the surface is so low as to be subject to overflow in all seasons, save where defended by levees. These bottom-lands, both high and low, are of the highest order of fertility; those farthest north being used for corn (maize) principally, and for tobacco and pasturage. Some of the largest have been reclaimed from liability to overflow by dikes across the water-channels by which they were inundated. Sny island in Pike co., Illinois, so reclaimed, is 40 m. in length. The American bottom extends from the mouth of the Missouri 90 m. down the river, with an average breadth of 6 miles. Below cape Girardeau (about 30 m. above the mouth of the Ohio), on the w. side, the whole country down to the gulf is mostly delta for an average width of 50 m.; and in high floods the river formerly overflowed nearly all the surface between the mouth of the Ohio and the St. Francis rivers in s.e. Missouri and eastern Arkansas, filling the lakes and lagoons of that region, and then flowing by numberless channels to the White river and Arkansas valleys, the bayou Macon, Washita, Red and Atchafalaya rivers into the gulf. This region is made safe from floods and habitable only by levees. The Louisiana delta has been for a hundred years to a considerable extent reclaimed by levees. The great delta on the east side, embracing the whole area between the Mississippi and the Yazoo, about 60 m. in width, has been partially protected for about 50 years, while the protection of the upper portion above Memphis is a more recent undertaking.

The first attempt to guard the lower part of the valley against the river floods was in 1717, when the French governor, De la Tour, ordered embankments for the protection of New Orleans. In 1728 the French planters of Louisiana were protecting each his own water-front, and soon after combined for joint work by neighborhoods and parishes. In 1828 the state of Louisiana began to take rigorous action for the more complete protection of its delta lands. In 1836 and 1838 several of the great side channels by which inundations had come were closed at the expense of the counties, and the question of the closing of all the overflow channels, so as to confine the stream to one bed in all stages of water, was the subject of much excited difference of opinion. The closure party prevailed, and one by one the side outlets of the Mississippi were cut off by levees, so that by 1844 every old river lake inlet for 600 m. up the w. bank had been effectually closed. The results were even more satisfactory than had been expected, so that the levee system was entered upon with increased spirit by the states bordering the river, and the aid of the general government was invoked to unify the work. Congress, in 1850, ordered thorough topographical and hydrographic surveys of the whole Mississippi delta, under the direction of capt. A. A. Humphreys and lieut. H. L. Abbott, who began work immediately; but the report was not submitted until Aug., 1861. While the U. S. government were thus obtaining complete data for the completion of the whole work, not only with reference to the reclamation of the vast and fertile deltas of the river, but with reference to the thorough improvement of its navigation from the gulf to its upper waters. the states most interested in the levees continued work upon them till

checked by the operations of the rebellion in 1862–64. By the report of Humphreys and Abbott, in 1861, it appears that substantial levees had been constructed on the e. side up to the n. line of the state of Mississippi, including one of great magnitude across the Yazoo pass—the largest of all the outlets closed; and that above on the e. side none of great magnitude were required. On the w. side the levees had been completed to the mouth of the Arkansas, and were partially completed, including the line 25 m. long opening into the St. Francis valley.

This was the condition of the lower Mississippi at the beginning of the rebellion. Louisiana alone had expended up to that time $18,000,000 on the levees of the main river; $5,000,000 more on its great side outlets, the Atchafalaya, Plaquemine, and La Fourche; and $1,000,000 on the shore of the Red river. The state of Arkansas had spent $1,000,000; Mississippi, on her water-front of 444 m., $14,500,000; and the state of Missouri, on her front of 140 m., $1,640,000. The total expenditure by individuals, parishes, and states up to that time, on about 2,000 m. of the river shore, is estimated by C. G. Fershey, of New Orleans, at upwards of $41,000,000, without counting the cost of its maintenance. The report of Humphreys and Abbott, in 1861, recommended confining the river to a single channel and making the levees higher at all points, and relatively as follows: at the mouth of the Ohio, 3 ft. above the highest flood ever known (which was then that of 1858); 7 ft. above from Osceola to Helena; 10 ft. above from Helena to island No. 71; thence down to Napoleon 8 ft.; thence to Lake Providence to be increased to 11 ft.; thence to the mouth of the Yazoo and Red River Landing to be reduced to about 6 ft.; and below to be reduced gradually to 3 ft.; and they estimated the cost of carrying out this recommendation at $17,000,000. The tendency of all streams to build up the level of their bottoms by bars formed at their mouths was met by a recommendation to construct a jetty system at the main mouth of the Mississippi, by which its depth should be increased and maintained.

The subject of levee construction was again taken up by the U. S. government by an act of June 22, 1874, authorizing president Grant to appoint a board of commissioners to make a full report on the best system for the permanent reclamation of the delta basin of the Mississippi. Maj.gen. G. K. Warren and gen. Humphreys were put at the head of the commission, and reported, Jan. 22, 1875, substantially the recommendation of the preceding report, carried further up the great tributaries of the lower Mississippi; that the general government should make and enforce the laws necessary to execute and protect the work; and that the work should be divided "into six natural drainage districts, viz.: 1. The St. Francis bottom-lands, comprising the w. bank of the river from Cape Girardeau to Helena; 2. the White river bottom-lands, lying between Helena and the mouth of the Arkansas; 3. the Tensas bottom-lands, extending from the Arkansas to the Red river; 4. the Yazoo bottom-lands, lying between the bluffs below Memphis and Vicksburg on the e. bank; 5. Louisiana below Red river on the w. bank; and 6. Louisiana below Baton Rouge on the e. bank. In each of these districts the commission recommended the appointment of a single controlling engineer, with full power in his district, subject to the control of a board composed of the chiefs of each department. The cost of the entire work recommended by this commission by districts was as follows:

ESTIMATES FOR PERMANENT SYSTEM OF LEVEES.

District.	Cubic yards.	Cost at 40 cts. per cubic yard.
St. Francis bottom-lands	17,265,000	$6,906,000
White river bottom-lands	4,652,000	1,760,800
Yazoo bottom-lands	31,188,000	12,575,200
Tensas bottom-lands	36,690,000	14,676,000
Louisiana below Red river, w. bank	15,114,000	6,045,600
Louisiana below Baton Rouge, e. bank	9,865,000	3,946,000
Total	114,774,000	$45,909,600

The annual cost of maintenance is estimated at $2,000,000. The length of levees estimated on is 1775 miles.

The commissioners state the amount of land reclaimed and to be reclaimed by this system "at least 2,500,000 acres of sugar land, 7,000,000 acres of the best cotton land in the world, and not less than 1,000,000 acres of corn land of unsurpassed and inexhaustible fertility." Other authorities place the area that will be reclaimed as high as 23,000,000 acres of good land. This probably includes the swamps that may be subsequently reclaimed.

The three main mouths or passes of the river to the gulf diverge where the river has treble its mean width, that is about 7,500 ft., with a mean depth of about 26 feet. It is through the South pass that the recent great work of the government under capt. Eades has been done to deepen and confirm the main channel, and prevent the rise in the level of the bottom of the river. The outer edge of the bar formed at the mouth of the South pass since 1838 was found to have pushed into the gulf about 300 ft. a year. The depth of the gulf at the foot of the slope formed by the deposits of the river is from 300 to 500 ft., the course of the main or South pass being direct towards its deeper waters.

The report from which these facts are drawn is published under the title of the

Report upon the Physics and Hydraulics of the Mississippi River, by Capt. A. A. Humphreys and Lieut. H. L. Abbott; Philadelphia, quarto, 1861.

The expenditures of the general government on the Mississippi to June 30, '84, have been as follows:

Mouth of the Mississippi, 1836–56	$690,000
Above the mouth, 1836–56	465,000
Mouth of the Mississippi, 1856–75	1,224,000
Between Illinois and Ohio rivers	1,425,695
Des Moines rapids	4,393,003
Rock Island rapids	1,163,215
Upper Mississippi and falls of St. Anthony	870,640
Mouths of the Mississippi, June 1, 1875, to June 30, 1884	4,438,108
Other parts of the river during the same time	9,850,000
Total	$24,519,661

The following table gives the relatve expenditures in several portions of the river since June 1, 1875:

Year.	Mississippi, lower part of.	Upper Miss. miscellaneous.	Miss., Mo., and Ark.	Rock Island Rapids.	Des Moines Rapids.	Falls of St. Anthony.
1876	$348,108	$19,000	$85,000	$50,000	$481,000	$100,000
1877	641,000	76,500	70,500	15,000	165,000	93,000
1878	1,075,000	38,100	70,200	10,000	65,000	20,000
1879	1,094,000	38,100	70,200	10,000	65,000	20,000
1880	.....	.....	190,000	6,000	25,000	10,000
1881	.....	8,000	200,000	8,000	20,000	.....
1882	.....	150,000	250,000	.....	8,000	.....
1883	.....	25,000	185,000	.....	30,000	.....
1884	.....	.....	.....	.....	.....	.....
	$3,158,108	$354,700	$1,120,900	$99,000	$859,000	$243,000

Total expenditures for eight years ending June 30, 1884, $17,289,308.

An act was passed by congress June 28, 1879, appointing the Mississippi river commission to complete surveys of the river, to prepare plans for deepening the channel protecting the banks and providing against floods, and to submit plans and estimates for work that could be done immediately and be a part of the general plan of improvements adopted. To June 30, '84, congress had appropriated $775,000 for the expenses of the commission and $6,923,000 for the work of improvement.

The deltas of the lower Mississippi are everywhere threaded with interlacing bayous and navigable channels, placing every cultivable acre of their lands near to steamboat navigation, one-tenth of the land being estimated as taken up by such water surfaces or channels. Below lat. 31° 30′ the sugar-cane is grown on the delta only. Cotton is grown nearly the entire length of it, but most advantageously north of lat. 31°. Corn and sweet potatoes are grown in every part of its whole area, and in the northern parts potatoes and the cereals do well.

The timber growing in the delta region of the Mississippi is mostly sycamore, cypress, and oak—the former margining the streams, the cypress occupying the swamps, and the oaks the lands not liable to frequent inundation, the live oak being principally found within a few hundred miles of the gulf.

The climate of the Mississippi valley ranges from semi-arctic to semi-tropical. At the falls of St. Anthony, and above, spirit thermometers must be employed to register the extreme low temperature in winter, which often touches 40° Fahr., and yet the extreme of summer heat is but a few degrees less at St. Paul than at New Orleans, 97° to 104°. The range between the extremes is about 65° more at the source than at the mouth of the river. The annual mean temperature at New Orleans is 69°; at Cairo, 45°.

For the history of the discovery and first settlements of the Mississippi, see De Soto; Marquette; La Salle; Iberville; New Orleans; St. Louis; St. Paul, etc. For commerce of the Mississippi, see New Orleans; Memphis; and St. Louis. For improvements at the mouth, see Jetty.

MISSISSIPPI RIVER, Improvements at the Mouth of. See Jetty.

MISSISSIPPI SCHEME. The gigantic commercial scheme commonly known by this name was projected in France by the celebrated John Law (q.v.) of Lauriston, in 1717, and collapsed in 1720. Its primary object was to develop the resources of the province of Louisiana and the country bordering on the Mississippi, a tract at that time believed to abound in the precious metals. The company was incorporated in Aug., 1717, under the designation of the *company of the west*, and started with a capital of 200,000 shares, of 500 livres each. They obtained the exclusive privilege of trading to the Mississippi, farming the taxes, and coining money. The prospectus was so inviting that shares were eagerly bought; and when, in 1719, the company obtained the monopoly of trading to the East Indies, China, the South seas, and all the possessions of the French East India company, the brilliant vision opened up to the public gaze was irresistible. The *Company of the Indies*, as it was now called, created 50,000 additional shares, but a rage for speculation had seized all classes, and there were at least 300,000 applicants for the new shares, which consequently rose to an enormous premium. Law, as director-general,

promised an annual dividend of 200 livres per share, which, as the shares were paid for in the depreciated *billets d'état,* amounted to an annual return of 120 per cent. The public enthusiasm now rose to absolnte frenzy, and Law's house, and the street in front of it, were daily crowded with applicants of both sexes and of all ranks, who were content to wait for hours, nay, for days together, in order to obtain an interview with the modern Plutus. While confidence lasted, a factitious impulse was given to trade in Paris; the value of manufactures was increased fourfold, and the demand far exceeded the supply. The population is said to have been increased by hundreds of thousands, many of whom were glad to take shelter in garrets, kitchens, and stables. But the regent had meanwhile caused the paper circulation of the national bank to be increased as the Mississippi scheme stock rose in value, and many wary speculators, foreseeing a crisis, had secretly converted their paper and shares into gold, which they transmitted to England or Belgium for security. The increasing scarcity of gold and silver becoming felt, a general run was made on the bank. The Mississippi scheme stock now fell considerably, and despite sundry desperate efforts, which were attended with momentary success, to keep up its credit, it continued to fall steadily and rapidly. In Feb., 1720, the national bank and the Company of the Indies were amalgamated, but though this gave an upward turn to the share market, it failed to put the public credit on a sound basis. Several useless attempts were made to mend matters; and those suspected of having more than a limited amount (fixed by a law passed at the time) of gold and silver in their possession, or of having removed it from the country, were punished with the utmost rigor. The crisis came at last. In July, 1720, the bank stopped payment, and Law was compelled to flee the country. A share in the Mississippi scheme now with difficulty brought 24 livres. An examination into the state of the accounts of the company was ordered by government; much of the paper in circulation was canceled; and the rest was converted into "rentes" at an enormous sacrifice.

MISSISSIPPI SOUND, a narrow strait washing the coasts of Alabama and Mississippi from Mobile bay to Pearl river—about 90 miles. It is formed and separated from the gulf of Mexico by several islands: Dauphin, Petit Bois, Horn, Ship, Cat, and the isle au Pied, the fifth of which is fortified. It is moderately deep, generally tranquil, and is navigated chiefly by the steamers and coasting vessels running between Mobile and New Orleans by the way of lake Pontchartrain.

MISSISSIPPI, UNIVERSITY OF, at Oxford, Lafayette co., was organized in 1848. By the liberality of the congress of 1819, two years after Mississippi had been admitted into the union, an entire township of the public domain within the state—23,040 acres—was granted to the state for the purpose of establishing a seminary of learning. The title to this land was, by act of congress, vested in the state legislature, *in trust,* for the support of the institution. The trust was accepted by the legislature, and, in pursuance of the spirit and intent of the act, "lands of great value" were selected by the state, and, in due time, 35½ of the 36 sections were sold. Upon this foundation the university was established, and, when it was located at Oxford, the citizens of Lafayette co. gave it a section of land as a site for its buildings. The endowment amounts to the sum of $540,000, and the annual income to more than $32,000. It has 10 buildings, which, with their contents, are valued at $300,000. The libraries contain over 6,000 volumes, which have been carefully selected with the view of supplying all the needs of classical, scientific, and law students. With physical, chemical, and electrical apparatus, and with cabinets of minerals, rocks, and shells, and other fossils, the university is well supplied. The geological department has a fine collection of accurate maps and charts, and geological reports of the various state surveys. The herbarium contains specimens of all the forms of vegetable life indigenous to Mississippi and some of the adjoining states. Zoology is rendered more interesting and intelligible by maps showing the geographical distribution of animals, and by a collection of vertebrates which is increased every year. This department also possesses maps showing the geographical distribution of plants. The university comprehends three general departments: 1. That of preparatory education; 2. That of science, literature, and the arts; 3. That of professional education, embracing for the present only a school of law, with 1 professor and 5 lecturers. The number of professors, 1884, was 10; tutors, 1; 1 principal of high school and 2 assistants; students in all the departments, including the preparatory and post-graduate courses, 276. Alexander P. Stewart, chancellor.

MISSIVE, in Scotch law, is a memorandum. See MINUTE; LETTERS.

MISSOLONGHI, also MESOLONGHI, a small t. of Greece, in the government of Ætolia, on the northern shore of the gulf of Patras, 24 m. w. of Lepanto. It is chiefly memorable for the two sieges which it underwent during the war of independence in the early part of the present century. In 1822 it was invested by land and sea by the Turks, who, after a siege of two months, were compelled to withdraw. In 1826 it was again besieged by an overwhelming Ottoman force, and after ten months of resistance and suffering, its garrison, reduced from 5,000 to 3,000 fighting-men, cut their way through the ranks of the enemy, carrying with them a great number of the women and children. The Turks then entered the town, which was all but totally destroyed. Here lord Byron died in 1824. Pop. about 4,000.

MISSOU'LA, a co. in n.w. Montana, having the British possessions on the n., and the state line of Idaho for its w. and s. boundary; 20,091 sq.m.; pop. '80, 2,533—1843 of American birth, 610 colored. Its surface is diversified by river, lake, and mountain, having the Rocky mountains on the e. and the Bitter Root mountains on its w. border. It is drained by the head waters of Clarke's fork of the Columbia river, the Kootenay, the Maple, and the Bitter Root or St. Mary's rivers, and by Flathead lake, the largest body of water in the territory, 10 m. wide and 25 m. long. A large proportion is covered with timber, but the soil of the valleys, especially the Bitter Root, is remarkably fertile, producing wheat, barley, oats, potatoes, and dairy products. Fruit-trees are largely imported from the states, and grow with very little care. Live stock is raised in large numbers. Gold is abundant, and worked principally by placer-mining. County seat, Missoula.

MISSOURI, one of the United States of America, in lat. 36° 30′ to 40° 30′ n., and long. 89° 2′ to 95° 52′ w., being 277 m. from n. to s., and from 200 to 312 m. from e. to w., having an area of 67,380 sq.m., or 43,123,200 acres. It is bounded n. by Iowa; e. by the Mississippi river; s. by Arkansas; and w. by Nebraska territory, Kansas, and the Indian territory. Missouri has 114 counties. Its chief towns are Jefferson City (the capital), St. Louis, Kansas City, Hannibal, St. Joseph, Lexington. Its chief rivers are the Mississippi, which borders the state for 470 m.; the Missouri, which forms a portion of its western boundary, and passes through it from w. to e.; and its affluents, the Osage, Gasconade, etc. The country s. of the Missouri river is undulating, rising into mountains toward the borders of Arkansas; the northern portion of the state is level prairie-land, with rich bottoms, and high picturesque bluffs on the rivers. The geological formations range between the lower Silurian and upper coal. There are porphyritic rocks in the s.; in the center, coal-measures, with veins of an aggregate thickness of 500 ft., highly bituminous, and immense deposits of iron, with lead and iron in limestone formations. The winters are long and severe; the summers hot, with sudden changes. Much of the land is very fertile, producing maize, wheat, hemp, tobacco, the peach, nectarine, grape, etc. Cotton is grown in the southern counties. A large German population has introduced wine-making. The chief manufactures are ironworks, distilleries, and breweries. St. Louis has a large trade, and the western towns supply caravans or trains to New Mexico, Utah, and California. The counties and cities have appropriated $45,000,000 to railways, and in 1875 there were 3,036 miles completed, and several hundred under construction. There are 39 universities and colleges, several medical and ecclesiastical seminaries, 8,000 public schools with 370,000 pupils, and above 2,000 churches. Missouri was formerly a part of upper Louisiana. St. Genevieve was settled in 1755 by emigrants from Canada and Spain. St. Louis, a French trading-post, in 1775 had 800 inhabitants. The country was purchased by president Jefferson in 1803; and in 1821, after a great contest, was admitted into the union as a slave state, under what was called the Missouri compromise, which admitted Missouri, but prohibited slavery n. of the northern boundary of Arkansas, 36° 30′ n. lat. In 1861 Missouri joined with the seceded states, and became a scene of civil war and violent partisan conflicts. Pop. in 1820, 66,586; in 1840, 383,702; in 1860, 1,182,317; in 1870, 1,715,000.

MISSOURI (*ante*) was a part of the vast territory claimed by the French as original discoverers and settlers, which, in the grant of Louis XIV. in 1712, was called Louisiana. The states of Arkansas, Iowa, Kansas, and Nebraska were also a part of this great region, the northern portion of which was called upper Louisiana. As early as 1720 the lead mines of Missouri attracted attention, but it was not until 1755 that the first settlement in the territory was made at St. Genevieve. In 1762 France ceded all that portion of the territory w. of the Mississippi to Spain, and that on the e. to England. In 1800 the region w. of the Mississippi was retroceded by Spain to France, and in 1803 it was sold by the latter to the United States. In 1755 St. Louis was known as a fur-trade station, with less than 1000 inhabitants, while St. Genevieve had about half that number. These and the smaller settlements grew very slowly until Louisiana and upper Louisiana alike came into possession of the United States. The vast region was then divided by congress into the territory of Orleans and the district of Louisiana—Missouri being included in the latter, which in 1805 was erected by congress into a territory, with St. Louis as its seat of government. In 1812, when a part of the territory of Orleans was admitted as a state to the union under the name of Louisiana, the name of the territory of Louisiana was changed to Missouri. The limits on the w. were enlarged from time to time by treaties with the Indian tribes. In 1810 the population numbered 20,845, of whom all but 1500 were within the present limits of Missouri. In 1817 the total population having increased to 60,000, while St. Louis was a town of 5,000 inhabitants, the territorial legislature asked leave of congress to frame a constitution with a view to the admission of the territory into the union as a state. This application led to a fierce excitement, not only in congress, but throughout the country. A very large number of the people of the free states were earnestly opposed to the admission of any more slave states to the union, while the people of the slave states were resolved that Missouri should not be excluded on this account. The subject was debated in congress with such heat that many citizens were alarmed lest it should lead to a dissolution of the union. Indeed, it was openly declared by some of the champions of slavery that the country would be

disrupted and the national government overthrown if the petition of Missouri were rejected. These threats so terrified some of the northern representatives that they yielded to the southern demands, and Missouri was admitted to the union in 1820 under conditions set forth in what has ever since been known as "the Missouri compromise," and which, as an offset for the addition of another slave state to the union, solemnly enacted that the system of slavery should be forever excluded from all that part of the territory of the United States lying n. of 36° 30′. The admission was consummated by a presidential proclamation dated Aug. 10, 1821. The growth of the state was thenceforth rapid. At the time of the rebellion in 1861 the people were about equally divided in sentiment, one portion adhering to the union, the other to the southern confederacy. The struggle between these two parties was very severe. The friends of secession, having control of the state senate, induced that body to call a state convention, but the body so summoned proved favorable to the maintenance of the union, and the scheme of the secessionists was defeated. Union troops having entered the state in considerable numbers, gov. Jackson, June 12, 1861, issued a proclamation calling into service 50,000 of the state militia "for the purpose of repelling invasion, and for the protection of the lives, liberty, and property of the citizens." The governor, in thus assuming that the presence of the union troops was an "invasion" of the rights of the state, endangering the lives, liberty, and property of the citizens, proclaimed himself in rebellion against the national government. Gen. Lyon, with a force of 1500 men, having taken possession of Jefferson City, the capital, in the name of the United States, and gov. Jackson and the other secession state officers having fled, the state convention again assembled, and on July 30 filled with loyal men the vacancies thus created. On Aug. 1 the new governor (Gamble) was inaugurated, and on the 5th the deposed governor issued from New Madrid a proclamation that the state was out of the union. Confederate troops in large numbers having assembled in the s.w. part of the state, gen. Lyon advanced from Booneville to Springfield to resist them. A battle took place Aug. 10, in which gen. Lyon was killed. The union forces, under gen. Sigel, retired to Rolla. On Aug. 1 gen. Fremont, commanding the department of the west, declared martial law throughout the state. Aug. 20 the rebel general Price compelled the federal forces, numbering 3,000, to retire from Lexington. Fremont thereupon hastened from St. Louis to Jefferson City, but the confederates, numbering 20,000, under gen. Price, retreated to Springfield and still further south. Fremont thereupon moved to the s.w. in five divisions, under gens. Hunter, Pope, Sigel, Asboth, and McKinstry. Nov. 2 Fremont was succeeded by gen. Hunter, and on the 18th gen. Halleck took command of the western department. Meanwhile a quorum of the legislature elected before the contest began, having assembled at Neosho, Newton co., passed an act declaring the state to be a part of the confederacy. Early, however, in 1862 a strong federal force under gen. Curtis drove the confederates into Kansas. During the rest of the year the state was disturbed by a guerrilla war, kept up by secessionists who had not removed within the confederate lines. In the summer of 1863 the state convention elected in 1861, and which had been kept alive by successive adjournments, passed an ordinance providing for the emancipation of all the slaves of the state in 1870. In 1864 gen. Price again invaded Missouri, threatening St. Louis, and traversing a large part of the state; but he was soon driven back again to Arkansas. The first state election since the war was held Nov. 4, 1864, and on Jan. 6, 1865, a state convention assembled in St. Louis and framed a new constitution, which in the following June was ratified by the people by a vote of 43,670 to 41,808. During the war the state furnished to the federal armies more than 108,000 troops. In 1869 the legislature ratified, by a large majority, the 15th amendment to the constitution of the United States. The population of the state in 1875, according to a state census, was a little short of 2,000,000. Pop. '80, 2,168,804; colored, 145,350.

The Missouri river, flowing across the state from w. to e., divides it into two parts, the largest of which lies s. of that stream. This portion of the state presents a considerable variety of surface. Extensive bottom-lands lie along the Mississippi from cape Girardeau to the Arkansas river. In these lands are many lakes and lagoons, with islands never submerged by the highest floods. In them also are many almost impenetrable swamps, filled with heavy growth of cypress. The most notable of these is the Great swamp, extending from a point near cape Girardeau s. 100 m.; and then reaching far into Arkansas. These bottom-lands, if reclaimed and protected from overflow, would, no doubt, be highly productive. From a point a little below cape Girardeau, northward to the mouth of the Missouri, the Mississippi is bordered by highlands, which, between St. Genevieve and the Maramec, take the shape of solid limestone bluffs, rising from 250 to 360 ft. above the river. From these highlands westward across the whole state, the land is high and broken, but growing less precipitous as the Osage river is approached. In the s.w. part of the state are the Ozark mountains, or hills, lying not in continuous ranges, but in isolated knobs and peaks, rising occasionally from 500 to 1000 ft., and presenting occasionally perpendicular cliffs of sandstone. The river valleys are moderately fertile, but subject to overflow, while the soil upon the hills is shallow. This part of the state is but sparsely populated. The region n. of the Missouri, and bounded on the w. by the same stream, is generally level or undulating, except at points where it is intersected by the smaller rivers with their outlying hills. The bottom lands on the Mis-

souri and the Mississippi are exceedingly fertile. Woodlands girt the streams, while the uplands are prairies, destitute of timber, but possessing a very productive soil.

The principal rivers of the state are the Mississippi and the Missouri; the former washing the entire e. boundary from n. to s., and presenting a shore line of 470 m.; the latter forming the w. boundary for nearly 200 m. from the Iowa line to Kansas City, at which point it turns eastward, flowing across the state in a tortuous course for more than 250 m. to the Mississippi. These great streams are navigable at all times, except when obstructed by ice. The Osage, one of the s. affluents of the Missouri, is navigable for small steamboats half the year. The St. Francis, White, Black, Current, Gasconade, Grand, and Chariton are navigable for small boats at high water, usually in early summer. Among the principal streams of the class not navigable are the Fabius, Salt, South Grand, Nodaway, Platte, Spring, Sac, Niangua, Cuivre, Piney, Maramec, and Castor rivers.

The mineral productions of Missouri are various and rich. Gold is found in the drift sands of the n., and silver in combination with lead in the galena and other ores. Iron in some form is found in every county, and in some places the supply is inexhaustible and of the richest quality. There are extensive bog ores in the s.e. part of the state, and the specular oxide is found in vast masses in the Iron mountain, Shepherd mountain, Simon mountain, Pilot Knob, and other places. Lead exists in immense quantities in two great fields, one in the s.e., the other in the s.w. part of the state. The lead production of Missouri is larger than that of all the other states of the union. Copper is also found in abundance in many places, and was formerly mined to a considerable extent, but since the discoveries of this metal on lake Superior these mines have been neglected. Nickel and cobalt are found at mine La Motte and the St. Joseph mines, and zinc is abundant in s.e. and s.w. Missouri. Carbonate of lime, gypsum, mica, hornblende, asbestus, bitumen, fire-clays, glass-sand, hydraulic lime and cement, polishing-stone, saltpeter, building-stone, granite, sandstone, marbles, etc., are abundant. The coal fields embrace about one-third of the whole area of the state. The coal is various in kind and quality, from common bituminous to the best cannel. Much of it is adapted to smelting purposes, and to the use of locomotives and stationary engines. There are in the state a great number of mineral springs, sulphurous, chalybeate, and saline. The salt springs of Howard county contain from 800 to 1200 grains of salt to the gallon.

The forests of Missouri are so extensive that wild animals are numerous. Among them are bears, panthers, wild-cats, wolves, foxes, raccoons, and opossums. Deer, rabbits, hares, and squirrels are abundant. Wild-turkeys, pigeons, quails, and prairie hens are in great numbers; song-birds and birds of gay plumage are numerous, and eagles, vultures, hawks, etc., prey upon the smaller birds. In the swampy regions on the Mississippi, wild-geese, ducks, herons, swans, etc., abound. Snakes, lizards, toads, frogs, and turtles are also numerous.

The climate of the state, with the exception of the river bottoms and swampy regions of the s.e., is generally healthful, though subject to great extremes of temperature. The summers are long, with a mean temperature of about 76°, the mercury sometimes marking 95°. The winters are cold and raw, with piercing winds, and a mean temperature of about 34°, sinking at times to 12°.

The soils of the state present a great variety. The alluvial deposits on the Mississippi and the Missouri are very rich and productive. The swamps, when drained, yield enormous crops. The prairies of the n.w. are very fertile, having lost little of their productive qualities after 30 years of culture. The mixed prairie and rolling lands n. of the Missouri, on the e. side, produce wheat and tobacco of the best quality. They are also good for fruits. The lands in the s.w. part of the state are good for grapes, peaches, pears, and apples, and for most of the cereals. The least productive soil in the state is in the region between s.w. Missouri and the swampy lands on the Mississippi. This region is traversed by the Ozark mountains, and much of it lies at an elevation of from 1200 to 1500 ft. above the sea. Some of the valleys are rich, but the hills are only moderately productive. Near the Arkansas line is a narrow belt of fair cotton land. Only about one-third of the area of the state is cultivated, and much of the uncultivated portion is heavily timbered. The trees most common are the cottonwood, hickory, black walnut, oak of many varieties, ash, walnut, sugar-maple, hackberry, elm, sassafras, dogwood, cedar, cypress, poplar, sweet gum, etc., and, near the Arkansas border, pine.

In 1880 there were in Missouri 215,575 farms, averaging 129 acres, a total of 27,879,276 acres. Of these 16,745,031 were improved and 11,134,245 unimproved. The estimated value of farms was $375,633,307; of farming implements and machinery, $18,103,074; of farm products, $95,912,660; of orchard products, $1,812,873; of market garden products, $763,439; of forest products, $4,551,729.

Among the products in 1880 were: maple molasses, 16,224 galls.; maple sugar, 58,694 lbs.; sorghum molasses, 4,129,595 galls.; hemp, 209 tons; milk, 3,173,017 gallons; butter, 28,572,124 lbs.; cheese, 283,484 lbs.; cotton, 19,733 bales. Among the products in 1883 were: rye, 570,851 bush.; barley, 179,982 bush.; buckwheat, 63,756 bush.; potatoes, 6,535,570 bush.; tobacco, 10,540,000 lbs.; hay, 1,400,021 tons. In 1884: corn, 197,850,000 bush.; wheat, 27,500,000 bush.; oats, 30,774,000 bush.

In 1884 the live-stock statistics were: Mules, 194,917, valued at $14,595,385; oxen and

other cattle, 1,335,082, valued at $30,199,555; swine, 4,800,566, valued at $19,375,063; horses, 701,702, valued at $42,516,124; cows, 674,565, valued at $18,887,820; sheep, 1,439,380, valued at $2,878,760.

The statistics of manufactures in the state in 1880 were as follows: Number of establishments, 8,592; persons employed, 63,995; capital invested, $72,507,844; wages paid, $24,309,716; products, $165,384,005. The principal branches of manufacture are: Blacksmithing, agricultural implements, bags other than paper, boots and shoes, brick, carpentering and building, railroad cars, carriages, and wagons, clothing, flouring and grist mill products, furniture, forged and rolled iron, pig iron, iron castings, distilled liquors, lumber, planed and sawed, refined sugar, animal oil, patent medicines and compounds, saddlery and harness, tobacco in all its forms. There is a bureau of labor statistics, and an inspector of mines, factories, and workshops.

The statistics of cotton manufactures for 1881 were as follows: Number of looms, 341; number of spindles, 19,312; bales of cotton used, 6,399; number of hands employed, 575. The best cotton is grown in Dunklin co. The wine produce of the state is believed to have been nearly or quite doubled in the last few years. The bluffs of the Mississippi and Missouri rivers are extensively planted with vineyards.

The iron industry ranks next to flour in importance, and is steadily increasing. St. Louis, which is already one of the great centers of iron and steel manufacture, produced in 1880, from 22 establishments, 125,758 tons. The pig iron produced in the state in 1883 amounted to 103,296 tons. In 1880, 35 counties raised 536,304 bushels of bituminous coal; in 1883, the tons of coal mined were 2,250,000.

There were 50 lines of railroad within the state at the beginning of 1884, having a total mileage of 4,650. The most important lines that traverse the state were the Chicago Baltimore and Quincy, 63 m.; Chicago Rock Island and Pacific, 170 m.; Missouri Pacific, 577 m.; Missouri Kansas and Texas, 285 m.; St. Louis and San Francisco, 486 m.; St. Louis Iron Mountain and Southern, 399 m.; and the Wabash St. Louis and Pacific, 479 m., within the state, while the more important domestic lines were the Hannibal and St. Joseph, 293 m.; St. Louis Hannibal and Keokuk, 84 m.; Kansas City St. Louis and Chicago, 162 m.; Louisiana and Missouri river, 100 m., and Quincy Missouri and Pacific, 136 m.

Acts were passed in 1883 to prevent the change of rates for freight without notice thereof by railroad companies in the state; to protect owners of property shipped for sale on commission; and to punish persons for making false returns of such sales.

The cost of roads and equipments was $308,884,233. The total earnings of the roads amounted to $34,523,272. There are over 2,000 m. of steel-rail track in the state.

The bonded debt of the state in 1885 was $15,243,000. The amount of property in the state subject to taxation was $725,775,259, of which about $41,898,850 was railroad property.

The commerce of Missouri is extensive. Under the act allowing foreign merchandise to be taken in bond direct to interior ports, a large trade has sprung up in St. Louis. St. Joseph and Kansas City are also ports of delivery, belonging to the department of Louisiana. Its shipping, 1884, was represented by 147 steam vessels, 132 barges. A great portion of the produce not only of this state, but of other portions of the northwest, passes through St. Louis on its way to market, making that city the centre of a vast domestic trade.

In 1884 there were in the state 34 national banks with a capital of $3,065,000; circulation, $1,215,183. In 1882 there were 144 state banks and trust companies, with $10,219,695 capital; 92 private banks and one savings bank.

In St. Louis and some of the other cities, the schools are carefully managed, and of an excellent character. The report of the state superintendent for 1881–82 gives the following statistics: School-houses, 8,537; schools, 8,822—501 for colored pupils; whole number of school age (6–20), 748,640; number enrolled (statistics incomplete), 492,749; whole number of teachers, 11,826; average monthly pay: men, $44; women, $38; amount of permanent school fund, $9,476,697; estimated value school property, $7,521,695; whole receipts for public schools, $4,277,876; expenditures, $3,753,224.

Missouri had, in 1882, a larger permanent productive school fund than Indiana, which, in the article on that state, was reported as leading the country. The school system of M. ranks among the best. Any city, town, or village may constitute a school district, and for the management of its educational interests elect a board of 6 directors for 3 years.

There are 5 normal schools for white teachers: at the state university at Columbia, at the state college at Rolla, and at Kirksville, Warrensburg, and Cape Girardeau. There is a normal school at St. Louis, and normal courses or departments at 7 other colleges and universities. The number of illiterate native white persons was 1,244,738. Colored teachers are trained at the Lincoln institute. Among institutions for higher education are the university of Missouri at Columbia, with collegiate, normal, agricultural, and mechanical, mining and metallurgical, legal, medical, and chemical departments; Washington university (non-sectarian) at St. Louis, with an endowment of $200,000, and buildings and grounds valued at $500,000; college of Christian brothers, at St. Louis,

Roman Catholic; St. Louis university, Roman Catholic; McGee college, at College Mound, Cumberland, Presbyterian; Christian university at Canton, under the patronage of the Disciples; Central college at Fayette, Southern Methodist; Hannibal college at Hannibal; Drury college at Springfield, Congregational; St. Joseph's college at St. Joseph, Roman Catholic; St. Paul's college at Palmyra, Protestant Episcopal; St. Vincent's college at Cape Girardeau, Roman Catholic; Lewis college, Glasgow, Methodist; William Jewell college at Liberty, Baptist; Woodland college at Independence, Disciples; Westminster college at Fulton, Presbyterian. There are 4 theological schools, belonging respectively to the Lutherans, Roman Catholics, Presbyterians, and Baptists, 2 schools of law; 9 of medicine, 1 one of which is homeopathic; 1 school of pharmacy, and 1 of dentistry. There are numerous academies, seminaries for girls, and other private schools of a high character, most of them under the control of some religious sect.

The public institutions for special classes are the asylum for the deaf and dumb at Fulton; the school for the blind at St. Louis; the state lunatic asylum at Fulton; the state penitentiary at Jefferson City; 13 orphan asylums, 8 of them under Roman Catholic control; an industrial school for girls, and a home for the friendless at St. Louis.

Washington university has an industrial-training school with courses of study covering 3 years, and industrial branches are taught at the institutions for the blind and deaf and dumb, and at some of the orphan asylums.

The number of newspapers and periodicals in 1880 was 530, of which 43 were dailies, 8 tri-weeklies, 415 weeklies, 8 semi-monthlies, 50 monthlies, and 1 quarterly. In 1884 the whole number had increased to 604.

The chief denominations are: Methodists, Baptists, Disciples, Presbyterians, Roman Catholics, Cumberland Presbyterians, United Brethren in Christ, Lutherans, Episcopalians, Congregationalists, Freewill Baptists, German Reformed, Unitarians, Evangelical association, Jews, Swedenborgians, Friends.

The capital of the state is Jefferson City. The principal city, St. Louis, is the largest in the Mississippi valley. Other large cities and towns in the state are Kansas City, St. Joseph, Hannibal, St. Charles, Springfield, Sedalia, and Lexington. The bonded indebtedness of the towns and cities, exclusive of St. Louis, St. Joseph and Kansas City, in 1882, was about $2,000,000.

The constitution now in force was adopted in 1875. The governor and other state officers are elected for a term of 4 years. The state election occurs biennially on the Tuesday next following the first Monday in November. The legislature, composed of a senate and house of representatives, meets biennially on the first Wednesday after the first day of January. The supreme court consists of 5 judges, elected by the people for a term of 10 years, the oldest in commission being chief-justice. The legislature divides the state into such a number of circuits as it may judge the public convenience requires, and the circuit court is composed of one judge for each of such circuits, elected by the people of said circuit for a term of 12 years. The judges of the county courts are elected by the several counties, as are also the judges of probate. The compensation of the governor, state officers, members of the legislature, and of the judges of the courts, is fixed by the legislature. Special courts are provided for the city of St. Louis.

The electoral votes of Missouri for president and vice-president of the United States have been cast as follows: 1824, 3 for Clay and Jackson; 1828, 3 for Jackson and Calhoun; 1832, 4 for Jackson and Van Buren; 1836, 4 for Van Buren and Johnson; 1840, 4 for Van Buren and Johnson; 1844, 7 for Polk and Dallas; 1848, 7 for Cass and Butler; 1852, 9 for Pierce and King; 1856, 9 for Buchanan and Breckenridge; 1860, 9 for Douglas and H. V. Johnson; 1864, 11 for Lincoln and Andrew Johnson; 1868, 11 for Grant and Colfax; 1872, 6 for T. A. Hendricks, 8 for B. Gratz Brown, and 1 for David Davis, for president; and 6 for B. Gratz Brown, 5 for G. W. Julian, 3 for J. M. Palmer, and 1 for W. S. Groesbeck, for vice-president; 1876, 15 for Tilden and Hendricks; 1880, 15 for Hancock and English; 1884, 16 for Cleveland and Hendricks.

MISSOURIA INDIANS, or Missouris, a tribe thus named by the Illinois Indians, but whose designation for themselves was Nudarcha. They were inhabitants of the region of the lower Missouri, and allies of the Illinois, and afterwards of the French. In 1725 some of the chiefs of this tribe went to France with the French commander De Bourgmont, and a sergeant in the command of the latter married a girl of the tribe. Yet this did not prevent the Missourias from assaulting their allies, and the French—a fort on an island in the river—was attacked by them, and the entire force massacred. The French and Missourias afterwards resumed their friendly relations, but the tribe never willingly accepted the English. They became greatly reduced, however, by small-pox and otherwise, and in 1805, when Lewis and Clarke were in their country, they numbered only about 300 souls. They abandoned their old camping-ground and dwelt with the Ottoes, and both these tribes were eventually removed to the Big Blue. Their number, which was 708 in 1862, had been reduced, ten years later, to 464.

MISSOURI COMPROMISE, the proviso contained in the bill admitting Missouri into the union, Feb. 28, 1821. Up to the time when the bill for the admission of Missouri was brought before congress in the session of 1818–19, an equal number of slave-holding and non-slave-holding states had been admitted. Vermont, Ohio, Indiana, and Illinois had balanced Kentucky, Tennessee, Louisiana, and Mississippi. After Alabama was allowed to become a state, without prohibiting slavery, and the bill for the admission of

the territory of Missouri was introduced, Tallmadge, member of congress from New York, moved an amendment, which was passed by a vote of 87 to 76, prohibiting the further importation of slaves, and emancipating slave children when they should reach the age of 25. A few days afterwards Taylor of New York, by way of compromise, proposed to amend the bill setting off Arkansas into a territory, by a proviso that slavery should not be extended to any part of the territory ceded by France to this country n. of 36° 30′ lat. His amendment met with bitter opposition from both northern and southern members, and was withdrawn. The opponents of slavery claimed that the question had been settled by the ordinance of 1787, which, in creating a government for the Northwest territory, provided that "there shall be neither slavery nor involuntary servitude in said territory otherwise than in punishment for crime." They maintained that the United States did not recognize slave property, whatever might be the laws of certain states; and they urged the authority of Jefferson, who had introduced a bill, in 1784, prohibiting slavery in the territory of the United States, and in such territory as might thereafter be annexed. The slave-holding members, on the other hand, maintained that congress had no constitutional right to prohibit slavery in the territories, and that such a prohibition would violate the provision guaranteeing to the citizen the enjoyment of his property. They declared that the south would go out of the union rather than submit to the proposed restriction The senate disagreed with the house, and the bill failed to pass. Alabama was admitted in the session of 1819–20, and her admission was followed by that of Maine. Meantime a strong public feeling against slavery had been growing in the middle states and in New England. In 1820 the Pennsylvania legislature resolved that congress had the right to prohibit slavery in the territories; and the legislatures of the other middle states, of Ohio and Indiana, passed resolutions to the same effect. The legislatures of the slave-holding states, on the other hand, opposed any congressional restrictions upon slavery. When congress met, after a long debate the senate, largely through the efforts of Henry Clay, returned the Missouri bill to the house with the clause prohibiting slavery in that state stricken out, but with a new proviso that slavery should not thereafter be allowed n. of 36° 30′. The house struck out the restricting clause by a vote of 90 to 87, and passed the compromise proviso by 134 to 42. The result was to postpone for a time the settlement of the slavery question. The compromise was virtually destroyed by the Kansas and Nebraska bills of 1854.

MISSOURI RIVER (Mud river), a river of the United States, and chief affluent of the Mississippi, rises in two forks, the Jefferson and Gallatin, in the Rocky mountains, Dakota territory, lat. 45° n., long. about 112° west. Its course is first northerly for 500 m., then easterly 1200, then south-easterly to the mouth of the Kansas, and easterly to its junction with the Mississippi. Its length from its source to the Mississippi is 3,096 m.; to the gulf of Mexico, 4,506. It is navigable at high water to the Great falls, 2,540 m. from the Mississippi. It is a turbid, rapid stream, with a vast number of tributaries, the chief of which are the Osage, the Kansas, the Platte, the Cheyenne, the Yellowstone. The upper Missouri is remarkable for its scenery; at 411 m. from its source it enters the gates of the Rocky mountains, a gorge of 5¾ m., between perpendicular walls 1200 ft. high and 450 ft. apart. At the Great falls, 145 m. below, the river falls 357 ft. in a series of rapids and cascades, 16½ m. long. The largest fall is 87 ft., and the scenery is full of grandeur.

MISSOURI RIVER (*ante*), drains an estimated territory of 500,000 sq. miles. It joins the Mississippi at lat. 38° 50′ 50″ n., and long. 90° 13′ 45″ w. from Greenwich. From the point where the Kansas enters it, its course is nearly e., and within the state of Missouri. Its current, in this part of its course, is about 5 m. an hour. The frequency of snags makes navigation difficult. The banks are thickly covered with wood. Between fort Leavenworth and its mouth three considerable rivers discharge into it—the Kansas, Grand, and Osage, all of which are navigable for 150 to 200 miles. From the Kansas to 40° 38′ n. lat. it is the boundary between Missouri and the Indian territory; and thence to the Big Sioux, between the Indian territory and Iowa. The Platte discharges into the Missouri through three channels, its waters having made a delta at its mouth. Before the Platte, at least five smaller streams—the Big and Little Nemaha, the Nodaway, the Nishnabotana, and the little Tarkio—empty into the Missouri. The course of the river, from the mouth of the Platte to the Kansas, and from fort Pierre to the Big Sioux, is s.e. Its general direction for the first 500 m. is n.; then it flows e.n.e. till it joins the White Earth, from whose mouth its general course is s.e. At a distance of 2,575 m. from its mouth occur the Great falls, where it descends 357 ft. in 16½ miles. The highest of these falls is 87 ft., and between and below them is a series of rapids. At a distance of 1216 m. from its mouth it is joined by the Yellowstone, its largest tributary; at 1310 m. from its mouth, by the Cheyenne; at 1130 m. from its mouth, by the White; at 853 m., by the Big Sioux; at 600 m., by the Platte; at 340 m., by the Kansas; at 240 m., by the Grand; and at 133 m., by the Osage. It is subject to two annual floods, one caused by the melting of the snow on the alluvial prairies, and occurring in May; the other, occurring in June, is caused by the melting of the mountain snows. Its total length is 3047 m.

MISSOURI, UNIVERSITY OF, at Columbia, near the center of the state, was organized in 1840. It has received the avails of Missouri's portion of the national grant of

land made by congress in 1862 for the establishment of colleges of agriculture and the mechanic arts, and upon this foundation it was reorganized in 1866. It embraces seven departments:—1. The college proper, founded in 1840; 2. the normal school, opened in 1868; 3. the agricultural and mechanical college; 4. the school of mines and metallurgy at Rolla, established in 1871; 5. the college of law, organized in 1872; 6. the college of medicine, organized in 1873; 7. the department of analytic and applied chemistry. The university is governed by a board of curators, appointed by the governor of the state with the advice and consent of the senate. It is open to students of both sexes. It had, in 1882, 31 instructors; and, in all the departments, 591 students. Samuel S. Laws, LL.D., president.

MIST. See Fog.

MISTAKE is a ground in law for having a contract reformed, and may be set up in some cases as a defense; but a mere mistake as to the legal effect of a deed or contract is in general not regarded as a ground for redress. When money has been paid by a mistake as to some important fact, it may be recovered back from the party to whom it was so paid by an action for money had and received; but if the mistake was made in a matter of law, it cannot be recovered back.

MISTAKE (*ante*), in law, is defined by Story as some unintentional act, omission, or error, arising from ignorance, surprise, imposition, or misplaced confidence. In courts of equity, as of law, the maxim applies, *Ignorantia facti excusat; ignorantia juris non excusat*—ignorance of the fact, not of the law, excuses. Thus where one word has by clerical mistake been substituted for another, equity will remedy the mistake; but where the parties have knowingly used a certain form of language believing that its legal effect is different from what it is in reality, they have no such remedy. If the parties be ignorant as regards a fact and aware of their ignorance, yet intend to risk the result, or, knowing the facts, intend to compromise both the law and the facts, then courts will not regard the fact that one party profited less by the contract than he had expected. Where an estate was supposed by both vendor and vendee to belong to the vendor under the law of real property, and was sold in that belief, the court, notwithstanding that the mistake seemed to be one of law, ordered the purchase-money to be refunded. A mistake as to the law of a foreign country is considered to be of fact and not of law, as public policy does not make it necessary that a citizen should be acquainted with the laws of other countries than his own. A trifling or immaterial mistake will not be regarded as ground for disturbing a written agreement. Specific performance will not be enforced when it is clear that the defendant through a mistake not resulting from mere carelessness has entered into a contract materially different from what he had intended. The instrument or contract may be ordered to be re-executed, or may be rescinded altogether. Thus where a solicitor, in writing a conveyance, inserted double the sum intended as purchase-money, he was compelled to re-execute the deed. An award of arbitrators based on a mistake of fact will be rescinded by a court; and even when based on a mistake in law, if the questions of law were not especially referred to them. An important exception to the rule that mistake of law does not excuse exists in those cases where the defendant has voluntarily entered into a promise to perform some act, such as paying a note or accepting a bill of exchange, *because* he supposes himself legally bound to do so, the fact being that he is not. That is to say, no mere waiver of a legal defense, ignorantly made, will compromise the rights of the maker. Often an instrument may be so *construed* by the court as to carry out the intentions of the parties, but in such case the construction must be supported by the instrument itself and not by external evidence; thus where there is a deed of certain land, it is allowable to explain what is meant by the description of boundaries or the relative ownership of several vendees; but if it be alleged that one piece of property has been mistakenly described in place of another, the deed cannot be rectified by mere construction of a court of law, but special action must be had in equity. Where there is any element of fraud or surprise involved, or where the case is one connected with trusts, equity will go very far in correcting the results of mistakes.

MISTASSINI. See page 881.

MISTLETOE (Anglo-Sax. *misteltan*, Ger. *mistel;* the *tan* of the Anglo-Saxon name means a tine or prong, a shoot of a tree; *mistel* is of uncertain etymology, but probably the same, in meaning at least, as the Latin *viscus*), a genus (*viscum*) of small parasitical shrubs of the natural order *loranthaceæ*. This order is exogenous, and contains more than 400 known species, mostly tropical and parasites. The leaves are entire, almost nerveless, thick and fleshy, and without stipules. The flowers of many species are showy. The calyx arises from a tube or rim, which sometimes assumes the appearance of a calyx, and is so regarded by many botanists; what others deem the colored calyx being viewed by them as a corolla of four or eight petals or segments. Within this are the stamens, as numerous as its divisions, and opposite to them. The ovary is one-celled, with a solitary ovule; the fruit one-seeded, generally succulent.—The only British species of this order is the COMMON MISTLETOE (*V. album*), a native also of the greater part of Europe, growing on many kinds of trees, particularly on the apple, and others botanically allied to it, as the pear, service, and hawthorn; sometimes, also, on sycamores, limes, poplars, locust-trees, and firs, but very rarely on oaks (contrary to the common belief). It is very plentiful in some parts of the south of England, its evergreen

leaves giving a peculiar appearance to the orchards in winter, when the bushes of mistletoe are very conspicuous among the naked branches of the trees; but it is very local. It is not a native of Scotland, though found naturalized in various places. The stems are *dichotomous* (i.e., divide by forking); the leaves are opposite, of a yellowish-green color, obovate-lanceolate, obtuse. The flowers are inconspicuous, and grow in small heads at the ends and in the divisions of the branches, the male and female flowers on separate plants. The berries are about the size of currants, white, translucent, and full of a very viscid juice, which serves to attach the seeds to branches, where they take root when they germinate, the radicle always turning toward the branch, whether on its upper or under side. The mistletoe derives its nourishment from the living tissue of the tree on which it grows, and from which it seems to spring as if it were one of its own branches. The berries are a favorite food of thrushes. Bird-lime is made from them and from the bark. The mistletoe was intimately connected with many of the superstitions of the ancient Germans and of the British Druids. In the northern mythology, Balder is said to have been slain with a spear of mistletoe. Among the Celts the mistletoe which grew on the oak was in peculiar esteem for magical virtues. Traces of the ancient regard for the mistletoe still remain in some old English and German customs, as kissing under the mistletoe at Christmas. The mistletoe was at one time in high repute as a remedy for epilepsy and convulsions, but it seems to possess no decided medicinal properties.—*Loranthus Europæus*, a shrub very similar to the mistletoe, but with flowers in racemes, is plentiful in some parts of the south of Europe, and very frequently grows on oaks.—*L. odoratus*, a Nepaulese species, has very fragrant flowers.

MISTRAL, Mistraou, or Maestral, the Provençal designation of the *caurus* or *corus* of the Romans, is a n.w. wind which at certain seasons of the year prevails on the s. coast of France. Its approach is heralded by a sudden change of the temperature from the most genial warmth to piercing cold; the air is felt to be purer and more easily inhaled, the azure of the sky is undimmed by cloud, and the stars shine by night with extraordinary and sparkling brightness; this last appearance is an infallible prognostic. The mistral then comes in sudden gusts, struggling with the local aërial currents, but its fast-increasing violence soon overcomes all opposition. In a few hours it has dried up the soil, dispersed the vapors of the atmosphere, and raised a dangerous tumult among the waters of the Mediterranean. The mistral blows with its greatest force from the end of autumn to the beginning of spring, and causes much damage to the fruit-trees in blossom, and often to the field-crops. It is a terror to the mariners of the gulfs of Lyons and Valence, and even the most hardy seaman makes all haste to a harbor of refuge. The most probable cause of the mistral is the derangement of atmospheric equilibrium produced by the cold condensed air of the Alps and Cevennes rushing in to supply the vacuum produced by the expansion of the air in the warm southern provinces of France and on the surface of the Mediterranean. This wind is very appropriately denominated by the Italians *maestro*.

MISTRAL, Frédéric, b in Provence, near Saint-Remy, 1830; son of a rich farmer; educated at the colleges of Avignon and Montpellier, and student of law, but not thereafter practicing it. His fame rests on his devotion to the revival of Provençal literature, especially poetry. Co-laborer in 1852 on the journal *Li Prouvençalo*, he became known at once both as critic and poet. His poems are *La Belle d'Août; La folle Avoine; l'Ode au Mistral; Amertume; La Course de Taurreau; Mireio;* and *Calendau*.

MISTRETTA, a t. of the island of Sicily, 67 m. w.s.w. of Messina, capital of a district. Pop. '71, 11,218. It occupies a healthy situation near the northern coast in the vicinity of the river Nebroden.

MITÂKSHARÂ is the name of several commentatorial works in Sanskrit, for instance, of a commentary on the text-book of the Vedânta philosophy, of a commentary on the Mîmânsâ work of Kumârila, of a commentary on the Br'ihadâran'yaka (see Veda), etc. The most renowned work, however, bearing this title is a detailed commentary by Vijnânes'wara (also called Vijnânanâtha), on the law-book of Yâjnavalkya (q.v.); and its authority and influence are so great that "it is received in all the schools of Hindu law from Benares to the southern extremity of the peninsula of India as the chief groundwork of the doctrines which they follow, and as an authority from which they rarely dissent" (cf. two treatises on the Hindu law of inheritance, translated by H. T. Colebrooke, Calcutta, 1810). Most of the other renowned law-books of recent date, such as the Smr'iti-Chandrikâ, which prevails in the s. of India, the Chintâman'i, Vîramitrodaya, and Mayûkha, which are authoritative severally in Mithilâ, Benares, and with the Mahrattas, generally defer to the decisions of the Mitâksharâ; the Dâyabhâga of Jimûtavâhana alone, which is adopted by the Bengal school, differs on almost every disputed point from the Mitâksharâ, and does not acknowledge its authority. The Mitâksharâ, following the arrangement of its text-work, the code of Yâjnavalkya, treats in its first part of duties in general; in its second, of private and administrative law; in its third, of purification, penance, devotion, and so forth; but, since it frequently quotes other legislators, expounding their texts, and contrasting them with those of Yâjnavalkya, it is not merely a commentary, but supplies the place of a regular digest. The text of the Mitâksharâ has been edited several times in India. An excellent translation of its chapter "On Inheritance" was published by Colebrooke in the work above referred to; and its expla-

nation of Yâjnavalkya is followed by the same celebrated scholar in his *Digest of Hindu Law* (3 vols. Calcutta and London, 1801), when translating passages from this ancient author.

MITAU. See MITTAU, *ante.*

MITCHEL, JOHN, 1815–75; b. Ireland; son of a Unitarian minister; graduated in 1836 at Trinity college, Dublin; and having been admitted to the bar, practiced for several years, when he removed to Dublin and became editor of the *Nation.* He now began to display a rebellious spirit, and wrote articles of a revolutionary tendency, thus falling under the suspicion and displeasure of the government. He was at this time in partnership with Gavin Duffy, but quarreled with him, and about 1847 originated the publication entitled *The United Irishman,* which was suppressed after a brief existence, and Mitchel was sent to Australia under sentence for 14 years. He escaped from the penal colony Jan. 3, 1852, and succeeded in getting transportation to New York, where he founded a weekly newspaper called the *Citizen.* He suffered from the climate, and afterwards took up his residence in Tennessee, publishing there a paper called the *Southern Citizen,* which became notorious from its open advocacy of the re-establishment of the slave trade. During the rebellion he was in Richmond, Va., where he edited the *Examiner* newspaper. He returned to New York at the close of the war; made a visit to Ireland; and, in 1875, after he had again settled in New York, was returned to parliament from Tipperary, but being disqualified, did not take his seat. He once more went to Ireland, however, where he died. He published several works upon Irish subjects.

MITCHEL, ORMSBY MCKNIGHT, LL.D., 1810–62; b. Ky.; received an excellent education when very young, being a good Greek and Latin scholar and mathematician when only 12 years of age. He entered West Point as a cadet in 1825, and after graduating in 1829, acted as assistant professor of mathematics in the military academy during the succeeding two years. He practiced law in Cincinnati from 1832 to 1834; and for the next ten years was professor of mathematics, philosophy, and astronomy in the Cincinnati college. In 1836 and '37 he was chief engineer of the Little Miami railroad. He interested himself greatly in astronomy, and took an important part in procuring the erection of an observatory in Cincinnati, of which, when completed, he became the director, combining with this position, in 1859, the directorship of the Dudley observatory in Albany. On the outbreak of the rebellion he entered the military service, being commissioned a brig.gen. of volunteers in Aug., 1861, and ordered to take command of the department of Ohio. He received his promotion to a major-generalship on account of a brilliant movement in April, 1862. He made a forced march into Alabama, and after a sharp engagement near Bridgeport, captured the railroad between Corinth and Chattanooga. In September he was ordered to the command of the department of the south, but before he had time to commence active operations, was attacked by yellow fever, and died. Gen. Mitchel had obtained a high reputation as an astronomer, and was remarkably successful as a mechanician in the construction of astronomical apparatus and instruments of precision. He made several important astronomical discoveries, including, with exactness, that of the period of rotation of the planet Mars. He wrote *The Planetary and Stellar Worlds,* and a *Popular Astronomy;* and, as early as 1846, published an astronomical periodical entitled *The Sidereal Messenger.*

MITCHELL, a co. in s.w. Georgia, having the Flint river on the w. and n.w.; 500 sq.m.; pop. '80, 9,392. It is intersected by a division of the Atlantic and Gulf railroad. The soil is generally fertile and the surface level. Productions are Indian corn, oats, sweet-potatoes, butter, cotton, and sorghum molasses. Co. seat, Camilla.

MITCHELL, a co. in n.e. Iowa, bounded on the n. by Minnesota; 431 sq.m.; pop. '80, 14,361. It is crossed by the Burlington, Cedar Rapids and Minnesota railroad. The soil is fertile, producing liberally of wheat, Indian corn, oats, barley, potatoes, and hay. There are manufactories of carriages and wagons, and agricultural implements; and woolen, saw, and flour mills. Co. seat, Mitchell.

MITCHELL, a co. in n. central Kansas, watered by the Solomon river; 720 sq.m.; pop. '80, 14,913. The surface comprises prairie land, very fertile; principal product, Indian corn. Co. seat, Beloit.

MITCHELL, a co. of n.w. North Carolina, bounded on the w. and n.w. by the Unaka mountains, which separate it from Tennessee, and on the s.w. by Nolichucky river; 530 sq.m.; pop. '80, 9,435. This county is important for its rich mines of mica, the working of which forms a most valuable industry. Iron and asbestus are also found; and forests of various kinds of timber cover the mountains. The productions are Indian corn, wheat, rye, potatoes, wool, and butter. Co. seat, Bakersville.

MITCHELL : co., Tex. See page 881.

MITCHELL, CHARLES LE MOYNE. See page 881.

MITCHELL, DONALD GRANT, b. Conn., 1814; educated at Yale, and called to the bar. He made a European tour, and published the fruits of his observations in 1847, under the title of *Fresh Gleanings; or, a New Sheaf from the Old Fields of Continental Europe.* This work appeared with the pseudonym of "Ik Marvel," which the author has since retained. He visited Europe during the revolutionary movement of 1848, which suggested his next book, *The Battle Summer,* which came out in 1849. The next year he published anonymously, *The Lorgnette,* a mild social satire. In the same year appeared his *Reveries of a Bachelor,* his most successful book, and which has been trans-

lated into French. In 1851 he published *Dream-Life, a Fable of the Seasons.* In 1853 he was appointed U. S. consul at Venice, whence he returned in 1855, and has since lived on a farm at Edgewood, near New Haven. This farm he has made the subject of two of his books, *My Farm of Edgewood,* 1863, and *Wet Days at Edgewood,* 1864. His later publications are *Seven Stories,* 1865; *Doctor Johns,* a novel; *Rural Studies,* 1867; and *About Old Story-Tellers,* 1878. His style is modeled upon that of Washington Irving, and though exceedingly graceful, is sometimes felt to lack relief.

MITCHELL, Elisha, d.d., 1793–1857; b. Conn.; graduated at Yale college in 1813; was tutor there 1816–18; professor of mathematics in the university of North Carolina in 1817–25, and afterwards of chemistry; was ordained a minister in the Presbyterian church in 1821. He was for some time state surveyor. In 1835 he ascended the Black mountains of North Carolina, and ascertained that they were the highest in the United States east of the Rocky mountains, estimating the principal peak, Clingman's peak, to be 6,476 ft. above the sea. In 1844 he again made the ascent, and made the height 6,672 ft. This being disputed, he made a third ascent in 1857 of one of the heights, and was killed by a fall from a precipice. He was buried on its summit. This is called in North Carolina Mt. Mitchell, or Mitchell's high peak.

MITCHELL, John, b. England; a physician who settled at Urbana, Va., about 1700, and gained recognition as a botanist, and after whom the *Mitchelli repens* was named by Linnæus. In 1755 he prepared a map of the British and French dominions in North America; and he also wrote, among other papers that attracted general attention, *The Contest in America between Great Britain and France,* and an essay on *The Causes of the Different Colors of People in Different Climates.* After his death in London in 1793, a manuscript written by him on the yellow fever in Virginia in 1742, came into the possession of Benjamin Franklin, and was found of much service by Dr. Rush of Philadelphia in his experiments in the epidemic of 1793.

MITCHELL, John H. See page 882.

MITCHELL, John I., b. Penn., 1837; was educated at the university at Lewisburg, in Union co., Penn.; and, graduating in 1858, read law and was admitted to the bar. At the outbreak of the rebellion, he enlisted in the 136th Pennsylvania volunteers, and was promoted to the rank of capt. After the close of the war, he settled at Wellsboro, Tioga co., Penn., and practiced law. In 1868 he was elected district-attorney of the county, and having served his term, was, in 1871, elected a member of the Pennsylvania house of representatives. He was chairman of the judiciary committee, served continuously until 1876, and became the recognized leader of the republican party in the house. In 1876 he was elected a member of congress, and was re-elected in 1878, but declined a renomination in 1880. In Feb., 1881, he was elected a member of the U. S. senate for Pennsylvania, after a bitter and protracted contest, in which a number of the most prominent men in the state were candidates.

MITCHELL, John Kearsley, 1796–1858; b. Va.; educated at the university of Pennsylvania, and, after making three voyages to China as surgeon of a ship, began to practice medicine in Philadelphia. In 1824 he lectured on medicine and physiology at the Philadelphia institute, where he became professor of chemistry in 1826. He accepted the chair of the theory and practice of medicine at the Jefferson medical college in 1841. Besides many contributions to scientific periodicals he published: *Saint Helena, a Poem by a Yankee,* 1821; *Indecision and other Poems,* 1839; *On the Cryptogamous Origin of Malarious and Epidemic Fevers,* 1849; and a collection of his essays appeared in 1858.

MITCHELL, Margaret Julia (known as Maggie Mitchel). See page 882.

MITCHELL, Maria, b. Mass., 1818; of Quaker parents. Her father, a schoolteacher in Nantucket, gave much attention to astronomy, in which his daughter at an early age became greatly interested. She devoted study especially to nebulæ and comets; and in 1847 she published an account of the discovery of a new telescopic comet, for which she received from the king of Denmark a gold medal. During the next ten years she was employed by the coast survey, and assisted in compiling the nautical almanac. In 1857 she traveled in Europe, visiting the principal observatories and astronomers; and in 1865 she became professor of astronomy in Vassar college. Miss Mitchell is a member of the American association for the advancement of science, and also of the American academy of arts and sciences, of which she was the first female member admitted. A short biography of her may be found in *Woman's Record of Distinguished Women,* by Mrs. Sarah J. Hale.

MITCHELL, Nahum, 1769–1853; b. Mass.; a descendant of Experience Mitchell, one of the founders of the first New England settlement; graduated at Harvard, class of 1789; was a teacher in early youth, and having studied law was admitted to the bar in 1792, and commenced practice in his native town, East Bridgewater. In 1811 he was appointed justice of the circuit court of common pleas for the s. circuit, and in 1819 chief-justice, holding the office for two years. He was highly esteemed in the community, and by members of the profession in his native state and in Maine, and was placed in many responsible positions. In 1798, and for several consecutive sessions, he was elected representative to the general court; member of congress 1803–5, state senator 1813–14, and member of the executive council 1814–20. In 1839 he was again elected to the general court, this time from Boston, to which city he had removed. In 1827 he was

chairman of the railroad commission which surveyed the route of the Boston and Albany railroad. He was at one time librarian and treasurer of the Massachusetts historical society, and was for some years president of the Bible society of Plymouth county. Endowed with musical talent of a high order and a passion for the art, associated with Mr. Bartholomew Brown he published *The Bridgewater Collection of Sacred Music*, for many years the standard musical publication of New England, the sale reaching 100,000 copies. In 1840 he published *History of the Early Settlement of Bridgewater*, with genealogical tables, the first American publication of the kind.

MITCHELL, Peter, Hon., b. New Brunswick, 1824; educated in his native place of Newcastle, served his county two terms (5 years) in the provincial parliament, entering public life in 1856, and was appointed life-member of the legislative council. He became a member of the executive government of New Brunswick in 1858 in the discontented political condition of the British American provinces in relation to the relative political influence of Upper and Lower Canada, and in 1864 suffered defeat with his government, which favored by a large majority a federal union of the whole of British America from the Atlantic to the Pacific, including Prince Edward's Island and Newfoundland, which latter, however, refused to co-operate. He was appointed delegate to Canada and England on this subject and that of the Intercolonial railway from Halifax to Quebec. In 1865, associated with the hon. R. D. Wilmot, mayor of St. John's, he formed an administration in order to test the opinion of the province on the question of confederation, and was president of the executive committee. When the vote was taken, confederation was carried 33 to 8. He was minister of marine and fisheries in the cabinet of the Dominion government, 1867–73, and in 1882 was elected representative in the Dominion parliament for Northumberland co., N. B.

MITCHELL, S. Weir, m.d., b. Philadelphia, 1829; educated at Jefferson medical college. He has since practiced in Philadelphia, making a specialty of nervous diseases. Among his writings are: *Injuries of the Nerves; Nurse and Patient; Fat and Blood; a* volume of magazine stories, a volume of poems, and *In War Time*, a novel.

MITCHELL, Samuel Augustus, 1792–1868; b. Conn.; a writer on geographical subjects; passed his childhood in Connecticut, and removed to Philadelphia, where he labored 40 years in cosmographical research. He prepared text-books of geography for the use of schools, maps and treatises considered superior to all others of their date. In 1846 he published *General View of the World;* in 1851, *Universal Atlas*, 76 sheets, forming a series of 130 maps, plans, and sections; in 1852, *Pocket Maps*, 53 in number;—in all 24 works, 400,000 copies of which have been sold in one year.

MITCHELL, Sir Thomas Livingstone, d.c.l., 1792–1855; b. Scotland; son of John Mitchell. His family altered its name of Mitchell upon its intermarriage with the Livingstones. Thomas Mitchell began his service in the British army in the Portugal campaign of 1808, and at the close of the peninsular war had been promoted maj. He was then sent to make surveys and plans of the peninsular battle-fields. In 1827 he published *Outlines of a System of Surveying for Geographical and Military Purposes*, and was made deputy surveyor-general of New South Wales. Besides the routine work of this office, he led a number of exploring expeditions into the interior of Australia. In 1831–32 he discovered the Pell river and the Nammoy. In 1835 he traced the course of the river Darling, which he followed, in 1836, as far as the Murray river, with which it unites. In the same expedition he followed the Glenelg river to the ocean. He gave the world the results of his explorations in his *Three Expeditions into the Interior of Eastern Australia, etc.*, which appeared in 1838. He came to England to take charge of this work and of his *Map of the Colony of New South Wales* in their passage through the press, and on the occasion of this visit was knighted. He also received the degree of d.c.l. from Oxford, and was elected to the royal and the geographical societies. On his return to Australia he conducted a fourth exploring expedition, in which he reached 21° 30′ south. He followed the Victoria river, which he was the first to find and name, but failed to advance as far as the gulf of Carpentaria, on account of losing his horses from a continued drought. In 1850 he published a school geography for use in New South Wales under the name of *Australian Geography*. His next publication was an account of a new steam propeller which he had invented on the principle of the boomerang. This work was published as the *The Origin, History, and Description of the Boomerang Propeller*. In 1854 he was made a col.

MITCHELL'S PEAK. See Black Mountains, *ante*.

MITCHILL, Samuel Latham, ll.d., 1764–1831; b. Long Island, N. Y.; graduated doctor of medicine in 1786 in the university of Edinburgh; returned to America in 1787, and studied law for three years; was appointed in 1792 professor of chemistry, natural history, and philosophy in Columbia college. He had at this time a controversy with Dr. Priestley in reference to some of Lavoisier's principles. In 1796 he made a geological and mineralogical tour along the Hudson. In connection with Dr. Edward Miller and Elisha H. Smith he established the quarterly *Medical Repository*, of which he was for 16 years the editor. He was a member of the legislature in 1801; twice a representative in congress, in 1801–4 and 1810–13; and in 1804 U. S. senator. In 1808 he became professor of natural history in the college of physicians and surgeons, and in 1820 of botany

and materia medica. He was vice-president of Rutgers medical school in 1826–30. He was somewhat eccentric. He proposed to have the name of this country changed to Fredonia, and in 1804 wrote *An Address to the Fredes or People of the United States.* He published the following works: *Observations on the Absorbent Tubes of Animal Bodies; Nomenclature of the New Chemistry; Life, Exploits, and Precepts of Tammany, the famous Indian Chief; Synopsis of Chemical Nomenclature and Arrangement.*

MITE, a name sometimes given to the *acarides* generally (see ACARUS); sometimes only to those of them which have the feet formed for walking, and the mouth not furnished with a sucker formed of lancet-like plates, as in the ticks (q.v.), but with mandibles. All of them are small creatures; the species are very numerous; they feed chiefly on decaying animal and vegetable substances, or are parasitical on quadrupeds, birds, and insects. The CHEESE MITE (*acarus domesticus*) is one of the best-known species; another is the FLOUR MITE (*A. farinæ*), too common among flour, in both of which the body is covered with hairs very large in proportion to its size, and capable of a considerable amount of motion. The SUGAR MITE (*A. saccharinus*) swarms in almost all *soft* sugar; but refined and crystallized sugar seems to defy its mandibles, and is free of it. The surface of jelly and preserves, when it has begun to become dry, is often covered with multitudes of very small mites. A species of mite is the cause of itch (q.v.); and many of the lower animals are infested by parasites of this tribe. Beetles may often be seen absolutely loaded by a species which preys on them; and bird-fanciers regard with the utmost horror the RED MITE, which lurks in crevices of cages and aviaries, and sucks the blood and eats the feathers of their inmates.

MITER, the point or line of union of moldings meeting at an angle.

MITFORD, MARY RUSSELL, a well-known English authoress, was the only child of a physician, and was b. at Alresford, Hants, Dec. 16, 1786. At the age of ten she was sent to a boarding-school at Chelsea, and also placed under the guidance and tuition of a Miss Rowden, a lady of a literary turn, who had already educated lady Caroline Lamb, and was destined to be the instructress of Miss Landon and of Fanny Kemble. During the five years she spent here she read with avidity, studying the tragic authors of France, Shakespeare, and the early dramatists of England. At the age of 15 she returned home, and before she was 20 she published three volumes of poetry. These having been severely castigated by the *Quarterly Review*, she applied herself to writing tales and sketches for the magazines. The profession she had adopted from taste she was obliged to continue from necessity, for the spendthrift habits of her father, a good-natured but careless gentleman, had exhausted a competent fortune, and left him dependent on his daughter. The first volume of *Our Village* appeared in 1824, and the series of five volumes was completed in 1832. Of the more important of her dramatic works, *Julian* was first performed in 1823; the *Foscari* in 1826; and *Rienzi* in 1828—all of them, and especially the last, with success. Among her other important works are *Recollections of a Literary Life* (3 vols. 1852); *Atherton and other Tales* (a novel, 3 vols. 1854); and in 1854 she also published a collected edition of her dramatic works, in two volumes. In 1838 she received a pension from government, but neither this nor the growing ill-health of her later years induced her to relax her literary industry. She died at her residence, Swallowfield cottage, near Reading, Jan. 10, 1855.

Successful both as a compiler and an author, Miss Mitford has produced many interesting volumes; but her fame—if the admiring respect for an amiable lady and a woman of graceful literary genius may be so called—rests chiefly on the sketches of country life which compose *Our Village.* These sketches are chiefly memorable for their style, which, if not witty, is vivacious, genial, and humorous; the outcome at once of a good heart, an active brain, and a fine fancy.

MITFORD, WILLIAM, was b. in London, Feb. 10, 1744, and studied at Queen's college, Oxford, but left the university without taking his degree. In 1761 he succeeded to the family estate; and in 1769 became a capt. in the South Hampshire militia, in which capacity he made the acquaintance of Gibbon, then a maj. of the same, by whose advice and encouragement he was induced to undertake a history of Greece. Mitford's first work, entitled *An Inquiry into the Principles of Harmony in Languages, and of the Mechanism of Verse, Modern and Ancient,* appeared in 1774; but by far his most important publication was his *History of Greece*, the first volume of which appeared in 1784, and the last in 1818. It is a pugnacious, opinionative, one-sided, and even fanatical production. The author is an intense hater of democracy, and can see in Philip of Macedon nothing but a great statesman, and in Demosthenes nothing but an oratorical demagogue. Yet his zeal, which so often led him astray, also urged him, for the very purpose of substantiating his views, to search more minutely and critically than his predecessors into certain portions of Greek history, and the consequence was that Mitford's work held the highest place in the opinion of scholars until the appearance of Thirlwall and Grote. He died Feb. 8, 1827.

MITHRAS (cf. Sanskrit *Mitram*, friend), the highest of the twenty-eight second-class divinities of the ancient Persian pantheon, the *Ized* (Zend. *Yazata*), or genius of the sun, and ruler of the universe. Protector and supporter of man in this life, he watches over his soul in the next, defending it against the impure spirits, and transferring it into the

realms of eternal bliss. He is all-seeing and all-hearing, and, armed with a club—his weapon against Ahriman and the evil *Dews*—he unceasingly "runs his course" between heaven and earth. The ancient monuments represent him as a beautiful youth, dressed in Phrygian garb, kneeling upon an ox, into whose neck he plunges a knife; several minor, varying, allegorical emblems of the sun and his course, surrounding the group. At times he is also represented as a lion, or the head of a lion. The most important of his many festivals was his birthday, celebrated on Dec. 25, the day subsequently fixed —against all evidence—as the birthday of Christ. The worship of Mithras early found its way into Rome, and the mysteries of Mithras (*Hierocoracica, Coracica Sacra*), which fell in the spring equinox, were famous even among the many Roman festivals. The ceremonies observed in the initiation to these mysteries—symbolical of the struggle between Ahriman and Ormuzd (the good and the evil)—were of the most extraordinary and, to a certain degree, even dangerous character. Baptism and the partaking of a mystical liquid, consisting of flour and water, to be drunk with the utterance of sacred formulas, were among the inaugurative acts. The seven degrees—according to the number of the planets—were: 1. Soldiers; 2. Lions (in the case of men), or hyenas (in that of women); 3. Ravens; 4. Degree of *Perses;* 5. Of *Oromios;* 6. Of *Helios;* 7. Of fathers—the highest—who were also called eagles and hawks. At first of a merry character—thus the king of Persia was allowed to get drunk only on the feast of the mysteries—the solemnities gradually assumed a severe and rigorous aspect. From Persia the cultus of Mithras and the mysteries were imported into Asia Minor, Syria, Palestine, etc., and it is not unlikely that in some parts human sacrifices were connected with this worship. Through Rome, where this worship, after many vain endeavors, was finally suppressed in 378 A.D., it may be presumed that it found its way into the w. and n. of Europe; and many tokens of its former existence in Germany, for instance, are still to be found, such as the Mithras monuments at Hedernheim, near Frankfort-on-the-Main, and at other places. Among the chief authorities on this subject are Anquetil du Perron, Creuzer, Silvestre de Sacy, Lajard, O. Müller (*Denkmäler d. alten Kunst*). See GUEBRES, PARSEES, ZENDAVESTA.

MITHRIDA'TES (more properly, MITHRADATES, a name formed from the Persian *Mithras*, or *Mithra*, "the sun," and an Aryan root *da*, to give; hence "sun-given" or "sun-born" prince), the name of several kings of Pontus, Armenia, Commagene, Parthia, and the Bosporus, all of whom have sunk into insignificance, with the exception of Mithridates VI. of Pontus, surnamed EUPATOR and DIONYSUS, but more generally known as MITHRIDATES THE GREAT. Little is known of his early career. He succeeded his father, probably about 120 B.C., while under 13 years of age, and soon after subdued the tribes who bordered on the Euxine, as far as the Chersonesus Taurica (Crimea), and after the death of Parysatis, incorporated the kingdom of the Bosporus with his dominions. The jealous behavior of the Romans, and the promptings of his own ambitious spirit, now incited him to invade Cappadocia and Bithynia, but a wholesome fear of the power of the Great Republic induced him to restore his conquests. The *First Mithridatic War* was commenced by the king of Bithynia (88 B.C.), who, at the instigation of the Romans, invaded Pontus. Mithridates sent an ambassador to Rome to complain of this treatment, but he was sent back with an evasive reply. Mithridates immediately commenced hostilities, and his generals repeatedly defeated the Asiatic levies of the Romans, and he himself took possession of Bithynia, Cappadocia, Phrygia, and the Roman possessions in Asia Minor, the inhabitants of which last hailed him as a deliverer. By his orders, a great massacre of the Romans took place, in which, according to one account, 80,000, and according to another 150,000 were slain. He also sent three powerful armies to aid the Greeks in their rebellion, but the disastrous battles of Chæronea and Orchomenus broke his power in that country. He was, however, driven from Pergamus (85 B.C.) by Flavius Fimbria, and reduced to the necessity of making peace with Sulla, relinquishing all his conquests in Asia, giving up 70 war-galleys to the Romans, and paying 2,000 talents. The wanton aggressions of Murena, the Roman legate, gave rise to the *Second Mithridatic War*, in 83 B.C. Mithridates was wholly successful in this war, but peace was concluded on the *status quo*, 81 B.C. Mithridates felt, however, that this was merely a truce, and lost no time in preparing for a third contest, in alliance with Tigranes, king of Armenia, the next most powerful monarch of Asia. Tigranes seized Cappadocia, 76 B.C., and Mithridates, in the following year, invaded Bithynia, commencing the *Third Mithridatic War*. Mithridates formed an alliance with Sertorius (q.v.), and obtained the services of Roman officers of the Marian party, who trained his army after the Roman manner. The arms of Mithridates were at first successful; but afterward the Roman consul Lucullus (q.v.) compelled him to take refuge with Tigranes, 72 B.C. Lucullus then conquered Pontus, defeated Tigranes, 69 B.C., at Tigranocerta, and both Tigranes and Mithridates at Artaxata, 68 B.C. Mithridates, however, recovered possession of Pontus. After the war had lingered for some time, Cneius Pompeius (see POMPEY) completed the work of Lucullus, 66 B.C., defeating Mithridates on the Euphrates, and compelling him to flee to the Bosporus. Here his indomitable spirit prompted him to form a new scheme of vengeance, which was, however, frustrated by the rebellion of his son, Pharnaces, who besieged him in Panticapæum. Deeming his cause hopeless, Mithridates put an end to his own life, 63 B.C. Mithridates was a

specimen of the true eastern despot, but he possessed great ability, and extraordinary energy and perseverance. His want of success was owing not to his defects as a general, but to the impossibility of raising and training an army capable of coping with the Roman legions, and his system of tactics during the third Mithridatic war plainly shows his thorough conviction of this fact. He had received a Greek education at Sinope, could speak no less than 25 different languages and dialects, and possessed considerable love for the arts, of which his magnificent collections of pictures, statues, and engraved gems were a proof. In the estimation of the Romans, he was the most formidable opponent they ever encountered, and occasional reports of his various successes spread the utmost terror among them.

MITLA, a city in s.e. Mexico, on the plain of Mixtecapan, 15 m. s.e. of Oaxaca. The region is inhabited by the Zapoteco race, and is a city of ruins (Aztec, Mictlan, place of the dead). No positive information has been obtained as to the builders, but it is thought that its extensive ruins of monuments and edifices were the work of the progenitors of the present inhabitants. Its ruined palaces and temples, adorned with artistic sculpture, are well preserved, many roofs being supported by columns. In 1860, in a publication entitled *Charnay's Ruines Américaines,* there appeared a collection of photographs of these ruins.

MITRAILLEUSE, a machine-gun in which 37 or more large-bored rifles are combined with breech action, by means of which a shower of bullets may be rapidly projected by one man. It was invented in Belgium, and adopted by the French emperor soon after the Prussian-Austrian war of 1866. It was the chief cannon of the French artillery during the Franco-German war of 1870. The mitrailleuse existed in a primitive form as early as the 14th c., and well-preserved specimens may be found in the arsenals and museums of Vienna, Rome, Berlin, Moscow, and Constantinople.

MITRE (Lat. *mitra,* also *infula*), the head-dress worn in solemn church services by bishops, abbots, and certain other prelates in the western church. The name, as probably the ornament itself, is borrowed from the orientals, although, in its present form, it is not in use in the Greek church, or in any other of the churches of the various eastern rites. The western mitre is a tall, tongue-shaped cap, terminating in a twofold point, which is supposed to symbolize the "cloven tongues," in the form of which the Holy Ghost was imparted to the apostles, and is furnished with two flaps, which fall behind over the shoulders. Opinion is much divided as to the date at which the mitre first came into use. Eusebius, Gregory of Nazianzus, Epiphanius, and others speak of an ornamented head-dress, worn in the church; but there is no very early monument or pictorial representation which exhibits any head-covering at all resembling the modern mitre. From the 9th c., however, it is found in use, although not universally; and instances are recorded in which the popes grant permission to certain bishops to wear the mitre; as, for example, Leo IV. to Anschar, bishop of Hamburg, in the 9th century. The material used in the manufacture of the mitre is very various, often consisting of most costly stuffs, studded with gold and precious stones. The color and material differ according to the festival or the service in which the mitre is used, and there is a special prayer in the consecration service of bishops, used in investing the new bishop with his mitre. The mitre of the pope is of peculiar form, and is called by the name *tiara* (q.v.). Although the mitre properly belongs to bishops only, its use is also permitted by special privilege to certain abbots, to provosts of some distinguished cathedral chapters, and to a few other dignitaries. See Binterim, *Denkwürdigkeiten der Kirche,* 1 B. 2 Th., p. 348.

The mitre, as an ornament, seems to have descended in the earliest times from bishop to bishop. Among the Cottonian MSS. is an order dated July 1, 4 Henry VI., for the delivery to archbishop Chichely of the miter which had been worn by his predecessor. It was in some cases a very costly ornament. Archbishop Pecheham's new mitre, in 1288, cost £173 4s. 1d In England, since the reformation, the mitre is no longer a part of the episcopal costume, but it is placed over the shield of an archbishop or bishop, instead of a crest. The mitre of a bishop has its lower rim surrounded with a fillet of gold; but the archbishops of Canterbury and York are in the practice of encircling theirs with a ducal coronet, a usage of late date and doubtful propriety. The bishop of Durham surrounds his mitre with an earl's coronet, in consequence of being titular count palatine of Durham and earl of Sedburgh. Before the custom was introduced of bishops impaling the insignia of their sees with their family arms, they sometimes differenced their paternal coat by the addition of a mitre. Mitres are rare as a charge in heraldry, but are sometimes borne as a crest, particularly in Germany, to indicate that the bearers were feudatories, or dependencies of ancient abbeys.

MITRE, Bartolomé, b. Buenos Ayres, 1821; became an instructor in a military college in Bolivia in 1846 and also a journalist; was next engaged as an officer in the Bolivian army in a war against Peru; then successively as editor, politician, and finally military leader again in the movement of Buenos Ayres against gen. Urquiza in 1852, which resulted in the quasi independence of that province from the Argentine confederation. After returning to peaceful pursuits, he wrote the *Historia de Belgrano.* In 1860, after the re-union of the seceded province to the Argentine confederation, he was chosen governor of Buenos Ayres; and in 1862, when new difficulties with the federal

government had brought into existence the Argentine republic in place of the confederation, Mitre was elected president for six years. He was also a candidate again in 1874, but was defeated; after which he headed a rebellion that proved disastrous to his fortunes. Since then he has lived in retirement.

MITRE SHELL. A name applied to the shells of several species of *mitra*, a genus of gasteropods belonging to the family *volutidæ* (q.v.). The shells are very beautiful and much prized by collectors, the favorite being the bishop's mitre shell, of the species *M. episcopalis*. In the genus mitra the shell is fusiform, thick, spire elevated, acute; aperture small, notched in front; columella obliquely plaited; operculum very small. The animal has a very long proboscis; and, when irritated, emits a purple liquid having a very offensive smell. The eyes are situated on the tentacles or at their base. Over 400 recent and 100 fossil species have been described. In *M. episcopalis* the animal has a narrow foot, compressed and chaunded at its root, nearly square and slightly articulated in front, with a margined furrow, and pointed behind; eyes sessile at the base of the tentacles. The proboscis is twice the length of the shell. The shell is turreted, smooth, white, spotted with bright red; pillar, four plaited; outer lip denticulated at its lower part; epidermis thin. It is found in East Indian seas and islands of the South sea. *M. adusta* has a fusiform shell, turreted, ornamented with longitudinal reddish-brown spots; striæ transverse, impressed, rather remote and dotted; pillar fine plaited. It is found at Timor, Vanikoro. There are two varieties. The different species are found at depths varying from the surface to 17 fathoms, on reefs, sandy mud, and sands. They are all inhabitants of warm countries.

MITSCHERLICH, Eilhard, a distinguished Prussian chemist, was b. at Neuende, near Jena, in 1794, and d. at Berlin in 1863. In 1811 he proceeded to the university of Heidelberg, where he devoted himself to history, philology, and oriental languages; and he continued the study of these subjects at Paris and Göttingen. It seems to have been at the last-named university that (1814 or 1815) he first turned his attention to geology and mineralogy, chemistry and physics, and it was not till 1818, when he was at Berlin, that he selected chemistry as his special study. His observations on the striking similarity between the crystalline form and the chemical composition of the arseniates and the phosphates led to his discovery of the law of isomorphism (q.v.), the importance of which was so fully recognized by Berzelius that he invited the young chemist, in 1819, to Stockholm, where he studied till 1821, when, on the death of Klaproth, he was, on the strong recommendation of Berzelius, appointed to the vacant chair of chemistry at Berlin. One of his earliest discoveries after his appointment was that of the double crystalline form of sulphur, the first observed case of dimorphism. See Dimorphous. His investigations regarding the formation of artificial minerals, and his memoirs on benzine and on the formation of ether must be classed among his most important contributions to chemistry; but it is mainly on the discovery of isomorphism and dimorphism that his reputation will finally rest. His principal work is his *Lehrbuch der Chemie*, begun in 1829, and concluded in 1841. It has passed through five editions, and is especially valuable for the clear and simple way in which he has brought mathematics and physics to bear upon the subject. He was an honorary member of almost all the great scientific societies, and received the gold medal from the Royal Society of London for his discovery of the law of isomorphism.

MIT'TAU, or Mitau, the chief t. of the government of Courland, in European Russia, is situated on the right bank of the Aa, 25 m. s.w. of Riga, and was founded in 1271, by the grand master of Teutonic Knights. It was annexed to Russia in 1795. Pop. '80, 23,847, the majority of whom are Germans by birth or descent, 1000 are Jews, and only a few Russians. The town is indifferently built, the houses being chiefly of wood, and painted of a green or brown color. The most important buildings are the old castle—now the seat of the governor of the province, four churches, an astronomical observatory, a public library, a museum, and a number of educational and charitable institutions. As regards commerce and industry, the town occupies only the third place in the government, its principal product being articles of japanned iron and tin; there is an export trade in hemp, flax, and corn. Mittau is the winter residence of the gentry of the surrounding country, and was for some time the abode of Louis XVIII.

MIT'TERMAIER, Karl Joseph Anton, 1787–1867, b. in Munich, Bavaria; educated at the universities of Landshut and Heidelberg; for two years, 1819–21, he was a professor at Bonn, but the rest of his life was passed as professor of law and jurisprudence at Heidelberg, with the exception of the time occupied as representative of Baden at the provisional Frankfort parliament and occasional pleasure-trips in Italy, which last occasioned his *Italienische Zustände*, a criticism of Italian affairs. In politics Mittermaier was liberal, but would now be considered almost conservative by the radical party. For 20 years, 1820–40, he was a member of the Baden legislature. His greatest claim to distinction, however, lies in his extensive writings on jurisprudence, among which is a complete manual of criminal law, *Lehrbuch des Criminal-prozesses;* and he was an earnest advocate of reform in the German criminal procedure and in prison discipline. The number of his published writings is very large, including many treatises on branches of law, discussions on all the important questions of his time connected with jurisprudence, and especially on trial by jury and the penal code. He also published a transla-

tion of Francis Lieber's *Letter on Anglican and Gallican Liberty*, and edited the German translation of the same author's *Civil Liberty*.

MIT'TIMUS, an English law-term for a writ by which a record is transferred out of one court into another.

MITTIMUS (*ante*), in criminal practice both in England and in the United States, is a written mandate issued by a competent judicial officer, enjoining an officer of the law to safely convey the body of a prisoner to some place of imprisonment, and also commanding the keeper of such jail to receive and retain the prisoner for a certain time, or until released in course of law. A mittimus is more commonly called a commitment. The document must be issued in the name of the people or of the magistrate, must be dated, is usually sealed, and must describe with reasonable certainty the name or, if not known, the person of the accused, and the criminal offense with which he is charged. Technical nicety in the language of the mittimus is not necessary. The precept passes to the jailer, who is bound to receive the prisoner, and may be indicted for refusal, in which case the officer is bound to retain custody of the accused. It has been held, where a mittimus had been granted on evidence by a justice of the peace, and it was handed to the accused person with the request that he would carry that note to the jailer, and he, in ignorance of its nature, did so, that his detention was in all respects legal.

MITTOO, a country of central Africa, bounded n. by the territory of the Dinka, s. by that of the Nyamnyam, and lying between the Rohl and Roah rivers. The soil is fertile, producing various cereals, tuberous plants, and leguminous and oily fruits, without much labor. The wearing of iron and copper ornaments is common to both sexes, and both are fond of chains for fastening trinkets to their bodies. A thick iron chain on the neck indicates wealth, and some wear four of them. The people have goats and poultry, but no cattle; they eat the flesh of dogs, and are in contempt called Dyoor, or savages. In war they use bow, arrow, and spear, but not shields.

MITT'WEIDA, a t. of Saxony, in the circle of Zwickau, 35 m. s.e. of Leipsic. For centuries Mittweida has been noted for its industry. The principal branches of industry are spinning, cotton-weaving, manufacture of fustian, etc., together with dye-works and bleach-fields. Pop. '80, 9,280.

MITYLE'NÉ. See LESBOS.

MIXED CADENCE, in music, is a peculiar way of concluding a musical period or passage, which differs from the perfect, imperfect, and plagal cadence. The mixed cadence, which is most frequently used, consists of the sub-dominant harmony followed by that of the dominant.

MIXED MARRIAGES. In various countries of Europe, marriages between persons of different religious belief have either been prohibited or put under restrictions. The canon law forbade marriages between Christians and non-Christians; at one time, it merely discouraged, at another altogether prohibited the marriage of orthodox Christians with heretics. Subsequently to the reformation, papal dispensations were in use to be granted for marriages between Catholics and Protestants, with the condition annexed, that the children should be brought up in the Catholic faith. During the latter part of the 17th c., parents seem to have been left at liberty to make what agreement they pleased on this head; and in default of their making any, it was presumed that the children would follow the religion of their father. In the middle of the 18th c., the validity of mixed marriages, even when celebrated by the civil magistrate, was recognized by the papal court; and under Napoleon's rule, they became common, without stipulations as to the children. The events of 1815 restored sufficient influence to the Roman Catholic church to enable the clergy to put in force a rule by which they could refuse to celebrate such marriages without an assurance that the children would be brought up Catholics. By the law of many of the German states, the clergyman of the bride was the only person who could competently officiate, and an engagement of this kind was often not only repugnant to the father as a Protestant, but illegal. Conflicts followed between the civil and ecclesiastical authorities, which have sometimes been obviated by the priest, on whom the law imposes the celebration of the marriage, not pronouncing the nuptial benediction, but giving his presence as a witness along with two other witnesses when the parties declared themselves husband and wife—a kind of marriage whose validity is perfectly recognized by the canon law. In Spain, marriages between Catholics and Protestants have sometimes taken place in this way, avoiding the stipulations otherwise necessary regarding the children.

There was, till lately, a great diversity in the state of the law of mixed marriages in different parts of Germany. Prussia was the first state to do away the former restrictions by the recognition of a civil ceremony alone as that which constitutes marriage in the eye of the law. Until that change, the letter of the law provided that the children should be brought up in the faith of their father, and no compacts to the contrary were allowed. Practically, however, the law was largely evaded, no one having a recognized interest to object to the fulfillment of such agreements. In Bavaria, mixed marriages might be performed either by Protestant or Catholic clergymen; and the spouses had it in their power to make what arrangements they pleased regarding the children before or after marriage; but if no such arrangements happened to have been made, the children

were brought up in the religion of their father. In Saxony, and various other German states, the spouses might, before marriage, make what arrangements they liked as to the religion of their children: but if they had made none, the law obliged them to be brought up in the faith of their father. A bill for rendering civil marriage obligatory throughout the empire was brought before the Reichstag in 1874, and passed in 1875, thus extending the system of Prussia to all other German states. This bill enables men and women to be married independently of the consent of the clergy (not always easily obtained in Catholic districts), or of the difference of their religious beliefs. It also allows of children being left unbaptized, and brought up without being assigned to any religious denomination whatsoever. In Austria, the interposition of the Catholic priest is required in marriages between Catholics and Protestants. He need not, however, give the sacerdotal benediction; his passive assistance only is required, either in taking the declaration of the parties, which is followed by a Protestant ceremony, or by being present as a witness at the Protestant ceremony. When the husband is Catholic, all the children must be brought up Catholics; when the husband is Protestant and the wife Catholic, the sons follow the father and the daughters the mother. In Denmark stipulations may be made before or after marriage, and can be altered by mutual consent of the parents, or, in some cases, even after the death of one of them. Mixed marriages were, till lately, altogether prohibited in some of the Catholic cantons of Switzerland, but they are now authorized in all the cantons by the federal laws. It is generally the clergyman of the husband's creed who officiates, but at Zürich the ceremony is performed in both churches. In most cases, the children are required to be educated in the religion of their father.

In most German states, marriages between Christians and Jews or Mohammedans used to be interdicted; but, after 1849, the prohibitions were in individual cases dispensed with. In Denmark such marriages have been permitted on condition of the children being brought up Protestants. In Russia the members of both Greek and Roman communions are prohibited from intermarrying with non-Christians: members of the orthodox Greek church cannot marry Greek sectaries; but when an orthodox Russian marries a Protestant or Catholic, the benediction must be given in the Greek church, and the children baptized in the Greek communion. When the parents are of different religions, but neither belongs to the Greek church, ante-nuptial stipulations will be given effect to; if none have been made, the sons follow the father's faith, and the daughters the mother's.

In France the law regards marriage as a purely civil contract, and recognizes only the civil celebration, which is completely separated from the religious rite. As the faith of the parents is not taken cognizance of, questions regarding the religious education of the children cannot arise before the civil tribunals.

The only restriction to which mixed marriages are now subjected in any part of the United Kingdom is imposed by act 19 Geo. II. c. 13, applicable to Ireland only, that a marriage celebrated by a Catholic priest between a Roman Catholic and a Protestant, or a person who within 12 months has been or professed to be a Protestant, or between two Protestants, is null.

MIXED MATHEMATICS, a name given the purely scientific principles of mathematics when applied and intermixed with physical considerations. Such are hydrostatics, optics, and navigation.

MIXED RACES. The subject of *mixed races* is one intimately connected with an enlarged study of ethnology. It involves a consideration of the phenomena attendant upon the sexual union between individuals belonging to different varieties of the human race; as, for instance—adopting the classification of Blumenbach—between the European and the negro or the American Indian; or between the American Indian and the negro; or between any of these three and individuals belonging to the Malay and Mongolian varieties. It is well understood that such unions are in general prolific; and not only so, but that their offspring is likewise prolific; and this fact is much relied upon by some ethnologists as an argument in favor of the unity of the human race. They reason thus: Were the different varieties of mankind distinct species, as has been frequently alleged, then it would necessarily follow that the offspring of such unions would prove as unfruitful as those between the horse and the ass, the goat and the sheep, the wolf and the dog; and similarly with respect to the hybrids among birds, insects, and plants. To sum up, in the words of Dr. Prichard, the best exponent of this school of ethnology: "It seems to be the well-established result of inquiries into the various tribes of organized beings, that the perpetuation of hybrids, whether of plants or animals, so as to produce new and intermediate tribes, is impossible. Now, unless all these observations are erroneous, or capable of some explanation that has not yet been pointed out, they lead, with the strongest force of analogical reasoning, to the conclusion that a number of different tribes, such as the various races of men, must either be incapable of intermixing their stock, and thus always fated to remain separate from each other, or, if the contrary should be the fact, that all the races to whom the remark applies, are proved by it to belong to the same species." Dr. Prichard further observes, that so far from such unions between members of different varieties of the human race proving unfruitful, or their offspring unfruitful, the very opposite is the case, as, for instance, in unions between the negro and the European, the most strongly marked varieties of our race. "If we inquire,"

he says, "into the facts which relate to the intermixture of negroes and Europeans, it will be impossible to doubt the tendency of the so-termed mulattoes to increase. The men of color, or the mixed race between the creoles and the negroes, are in many of the West India islands a rapidly increasing people, and it would be very probable that they will eventually become the permanent masters of those islands, were it not for the great numerical superiority of the genuine negroes. In many parts of America they are also very numerous." It is to America, indeed, both North and South, that we must chiefly look for the numerous and varied phenomena resulting from this intermixture of races; for there we have not only the negro and the European mingling their blood, but the negro and the American Indian, the European and the Indian, and the offspring of each of these with the offspring of the other, or with members of either of the parent stocks; added to which, of late years, the Chinese (of Mongolian race or variety) have appeared upon the scene, thus contributing greatly to the number of what are termed *human hybrids*. All these, however, are not equally fertile; and with respect even to the mulattoes, it is alleged by writers of the Morton school of ethnology that they do not perpetuate themselves for many generations. "Nature," says Squier, rather dogmatically, "perpetuates no human hybrids—as, for instance, a permanent race of mulattoes." And Dr. Nott, adopting the classification of species laid down by Dr. Morton—namely, *remote species*, in which hybrids are never produced; *allied species*, which produce, *inter se*, an unfertile offspring; and *proximate species*, which produce with each other a fertile offspring—is of opinion that it is only by the union of southern or dark-skinned Europeans with negroes that thoroughly prolific mulattoes are engendered, which is not the case in unions occurring between individuals of the Anglo-Saxon and negro races. In arriving at this conclusion, we cannot help thinking that the author has been helped forward by the strong prejudice existing in the southern states against all taint of negro blood. A more impartial writer, prof. Wilson, in his *Prehistoric Man*, observes: "There are upwards of 4,000,000 of people of African blood in the United States, and certainly not less than 10,000,000 throughout the continent and islands of North and South America, and of these the larger proportion consists of hybrids. . . . It is impossible to determine with certainty how far the hybrid colored population of the United States is capable of permanency, either by the development of a fixed hybrid type, or by continuous fertility, until the predominant primary type reasserts its power, by their return to that of the original white or black parent, so long as the mixed breed is constantly augmented in the southern states by means at variance with the natural and moral relations of social life." As it is, the weight of evidence appears to be in favor of Dr. Prichard's views; but until the doctrine of hybridity is better understood, and a more satisfactory answer to the vexed question, "What is species?" has been supplied to us, we must deem it idle to pronounce dogmatically on the subject. See HYBRID and SPECIES. We conclude with a list of half-castes given by Dr. Tschudi, "with a few additions from other sources," printed in the appendix to prof. Wilson's valuable work just mentioned.

Father.	Mother.	Half-caste.
White	Negro	Mulatto.
White	Indian	Mestizo.
Indian	Negro	Chino.
White	Mulatto	Cuarteron.
White	Mestiza	Creole, only distinguished from the white by a pale brown complexion.
White	Chinese	Chino-blanco.
White	Cuarterona	Quintero.
White	Quintera	White.
Negro, N. A.	Indian	Zambo or Cariboco.
Negro, S. A.	Indian	Mameluco.
Negro	Mulatto	Zambo-negro or Cubra.
Negro	Mestiza	Mulatto-oscuro.
Negro	Chinese	Zambo-Chino.
Negro	Zamba	Zambo-negro (perfectly black).
Negro	Cuarterona	Mulatto (rather dark).
Negro	Quinterona	Pardoc.
Indian	Mulatto	Chino-oscuro.
Indian	Mestiza	Mestizo-claro (frequently very beautiful).
Indian	China	Chino-cholo.
Indian	Zamba	Zambo-claro.
Indian	China-cholo	Indian (with short frizzly hair).
Indian	Cuarterona	Mestizo (rather brown).
Indian	Quintera	Mestizo.
Mulatto	Zamba	Zambo.
Mulatto	Mestiza	Chino (of rather clear complexion).
Mulatto	China	Chino (rather dark).

MIXTE'CAS, the name of an ancient Indian race, said to have migrated from the north and settled in Mexico, populating that part of the republic which is now included in the states of Puebla, Guerrero, and Oajaca. They were an industrious people; were divided into independent bands, each with its own chief; and were inclined towards an advanced state of semi-civilization. They built cities, temples, and fortifications, the remains of which are significant of their capacity and progress. They possessed a relig-

ion, and conducted certain rites in mountain caves, and they included the idea of a heaven, which they named Sosola, in their theology. This race still exists, retaining a portion of its ancient territory, but has been driven from Puebla by the Mexicans, and in some instances forced to retire into Guatemala. Their language is similar to the Zapoteca, but simpler, although it has a number of dialects. The Mixtecas inhabit a region surrounded by mountain ranges, and are peaceable and industrious, not concerning themselves in the political disturbances which are so frequent in Mexico. Their principal cities are Tepascoluta, Yanhuistlan, Ilaxiaco, and Huajuapan.

MIXTURE, an organ stop, consisting of from two to five ranks of small metallic pipes. It is generally found in large organs, and resembles the sesquialtera and furniture stops, except that it is much higher and shriller. Like other compound stops, the two smaller ranks of the mixture stop change on the upper part of the organ scale into an octave lower. This is necessitated from the fact that the pipes in their upper ranks would produce too small a volume of sound.

MIXTURES are officinal preparations, extempore in their nature, some of which—as, for example, *mistura camphoræ*, *mistura cretæ*, and *mistura ferri composita*—are very extensively used in medical practice, either as vehicles for more active remedies, or for their intrinsic value.

MIZZEN, or MIZEN, the sternmost of the masts in a three-masted vessel, and also the smallest of the three. Above it are the mizzen-topmast, the mizzen-top-gallant-mast, and the mizzen-royal. It supports the usual yards, and, in addition, the gaff and boom of the spanker (q.v.). A rear-admiral hoists his pendant at the mizzen.

Although the word mizzen is now applied adjectively to the several parts, it appears formerly to have been the name of a large triangular sail carried in the stern, and thence to have become the distinguishing title of the mast which bore that sail. The name is probably from It. *mezzano*, mean, in the middle; in opposition to a square sail which lies across the vessel.

MNEMO'NICS. See MEMORY.

MNEMOSŸNE, in classical mythology the goddess of memory, and the mother of the Muses (q.v.), whom she bore to Jupiter. The principal seat of her worship was at Eleutheræ, in Bœotia.

MOA, the name given by the New Zealanders to the large wingless or struthious birds (see BREVIPENNES) of which the bones are found imbedded in the sands of the sea-shore, in swamps, forests, river-beds, and limestone caves, and of which traditions subsist among them as birds living in their country. The largest bones belong to the genus *Dinornis* (q.v.), others to *Palapteryx* (q.v.); and with them are found bones of a large bird (*Aptornis*) resembling a swan, supposed to be now extinct, also of the existing species of *Apteryx* (q.v.) and of *Notornis* (q.v.), much smaller birds. It is generally supposed that no large moas have been seen alive since about 1650; but it has recently been again alleged that some have been seen, and rewards have been offered for the capture of them. They are represented by the New Zealanders as stupid, fat, indolent birds, living in forests, mountain fastnesses, etc., and feeding on vegetable food. Their feet are said to have been adapted for digging. They seem to have been extirpated for the sake of their flesh, feathers, and bones. The eggs were eaten. The leg-bones of the moas were filled with marrow, and not with air, as those of other birds.

MO'ABITES, a pastoral people, who inhabited the mountainous country e. of the lower part of the Jordan and of the Dead sea. Their *cultus* was characterized by many very odious rites, among which was human sacrifice. In the time of the Judges, the Jews were for eighteen years under the yoke of the Moabites, who were afterwards made tributary by David, but, about 900 B.C., shook off their allegiance to the Jewish kings, and afterwards took part with the Chaldeans against the Jews. Their name no longer exists, and the remnants of the people have long been included among the Arabs.

MOABITES (*ante*), the descendants of Moab, son of Lot, whose primitive dwelling-place was Zoar, on the south-eastern border of the Dead sea. Gradually supplanting the original inhabitants, they obtained possession of the fertile highlands—extending 40 or 50 m. in length by 10 in width on the e. of the Dead sea—and of the plains below. From the most elevated part of this territory they were expelled by the Amorites, who allowed them to retain only the southern half of the table-lands and the plain. This restricted region was strongly fortified by nature, having on the n. the chasm of the Arnon; on the w. cliffs, almost perpendicular, by the side of the Dead sea, intersected only by a few steep and narrow passes; and on the s. and e. semi-circular hills, through which pass only a branch of the Arnon and the wadys or valleys that go down to the sea. Beyond these hills lay a vast extent of uncultivated pasture-grounds, described in the book of Numbers as the wilderness which faced Moab on the east. Through this Israel seems to have approached the promised land, without traversing Moab itself, but taking their position n. of the Arnon. Here they remained during their operations against Bashan. It was at this time that Balak, king of Moab, in his fear of Israel, sent for Balaam to curse them, and for the Midianites to make war against them. From the plains of Moab Moses ascended to the top of Pisgah to view the promised land; in the land of Moab he died; somewhere in a valley of that land, over against Beth-peor, he was buried; and in

the plains of Moab all Israel wept for him 30 days. After the conquest of Canaan, Eglon, king of Moab, with the assistance of the Ammonites and Amalekites, gained possession of Jericho and ruled over Israel 18 years. From this bondage they were delivered under the leadership of Ehud, a Benjamite, who killed Eglon secretly, and aroused the people to a victorious conflict in which 10,000 Moabites were slain. Afterward peace and friendship between the nations were restored. While the judges ruled, Jews sometimes took refuge in the land of Moab; and long afterward, when David was hard pressed by Saul, he obtained from the king of Moab a temporary asylum for his father and mother. Saul waged war successfully against the Moabites, and David made them tributary. After the revolt of the 10 tribes, the kingdom of Israel levied this tribute, and when, on the death of Ahab, the Moabites refused to pay it, Jehoram, with the help of Judah and Edom, attempted to hold them in subjection. The Moabites, in revenge, formed a powerful confederacy against Judah, but the different armies which composed it, panic-stricken, turned their arms against each other. Still later, they acted against the Jews as auxiliaries of the Chaldeans, under Nebuchadnezzar: yet this monarch, according to Josephus, five years after the capture of Jerusalem, made war also upon them, and subdued them. After the return of the Jews from captivity, they formed an intimate connection with the Moabites by intermarriages, which, however, the zeal of Ezra and Nehemiah broke up. Josephus mentions the cities between the Arnon and Jabbok as cities of Moab. Thenceforth they were almost lost to view among the Arabians; and for many centuries little was known concerning the region in which they lived. Even in more modern times few travelers ventured to explore it. Seetzen, in 1806, at the risk of his life, shed a new and unexpected light upon it. He found many ruined places still bearing the old names. In 1812 Burckhardt made the same tour from Damascus to Karak, and from that point advanced to Petra. From these and subsequent travelers we learn that the plains are covered with the sites of towns on every eminence or spot suitable for one. The land is capable of rich cultivation. The form of fields is still visible, and there are remains of Roman highways which are in some places completely paved, and on which there are mile-stones of Trajan, Marcus Aurelius, and Severus, with the numbers legible upon them. Denunciations against Moab were made by Balaam, Amos, Isaiah, Jeremiah, Ezekiel, and other prophets, who during its highest prosperity foretold that its cities should become desolate without any to dwell in them; and at the present day, while the sites, ruins, and names of many of its ancient cities can be traced, not one of them has been found inhabited by man. At the present time the American engineers of the Palestine exploration society are engaged in making a scientific survey and exploration of the land.

MOABITE STONE, The, a stone bearing a long inscription in Hebrew-Phenician letters, discovered at Dibân, in Moab, in 1868. It appears to have been erected by Mesha, king of Moab, mentioned in 2 Kings, vii., and the inscription refers to his wars with Israel (in the 10th c. B.C.). The negotiations set on foot for its purchase led to quarrels among the Arab tribes claiming an interest in it, and the memorial was unfortunately broken to pieces. The fragments, however, were with great difficulty collected, and are now preserved in the Louvre.

MOABITE STONE, The (*ante*). The authenticity of this stone, disputed on grounds which have little to do with true critical research, is now universally acknowledged. Its date may be taken as 890 B.C., and is almost the same as that of the inscriptions on the lions of Birs Nimrûd, that is, the reigns of Ashurnazirpal and Shalmanezar IV. Its characters are like those of the fourth Malta inscription, and again like that from Nora, in Sardinia. We have, then, in the 9th c. B.C., one single and same type of letter in use for current purposes from Sardinia to Assyria, which, about the 6th or 7th c., gives rise to the second form, or true Phenician, and to the old Hebrew of coins and gems, whose modern representative is the Samaritan. The stêl of Mesha contains all letters except Teth, and which, showing few dialectic variations, appears to stand, in willingness to express vowels, between the Hebrew and the Assyrian, without the parsimony so distinctive of the Phenician. There is a translation by Dr. Ginsburg in *Records of the Past*, vol. xi.

MOAT, the ditch round the ramparts of a fortress, may be either wet—i.e., full of water—or dry. In the latter, which is the commoner case, the depth should not be less than 12 ft., nor the width under 24. The more perpendicular the walls, so much the greater will be the obstruction to the enemy. In regular works the walls are usually revêted with masonry, that at the foot of the rampart being the scarp or escarp, and that below the covered way the counterscarp. See Ditch and Fortification.

MOAWIYAH, Caliph, 610–80, b. Mecca; son of an Arab chief of distinguished birth, and distantly related to Mohammed. He was made governor of Syria in 641, and during his term of office conquered the island of Rhodes, but lost Cyprus. On the proclamation of Ali as the successor of the caliph Othman in 655, Moawiyah revolted, and attempted to make himself caliph. He succeeded in getting control of most of the provinces of the empire, and took possession of Samarcand and Bokhara. His army, after making extensive conquests, was unable, after a long siege and repeated assaults, to capture Constantinople, and in 678 he entered into a treaty of peace. Moawiyah not only exerted absolute control over the Saracen empire, but succeeded in having the caliphate declared hereditary in his family.

MOBERLY CITY, Missouri. See page 882.

MOBERLY, GEORGE, D.C.L., b. St. Petersburg, 1803; son of an English merchant. He was educated at Winchester and Oxford. In 1826 he took the Oxford chancellor's prize for the best English essay, choosing for his subject, *Whether a Rude or a Refined Age is the more Favorable to the Production of Works of Fiction.* He took the degree of M.A. in 1828 and of D.C.L. in 1836. After a connection of some years with Balliol college, as tutor and fellow, he became, in 1835, head-master of Winchester school, where he remained until 1866. He was then presented with the living of Brixton in the isle of Wight, and in 1868 became a canon of Chester cathedral. In 1869 he was consecrated bishop of Salisbury. Of his numerous published works the most important are: *A Few Remarks on the Proposed Admission of Dissenters into the University of Oxford*, 1834; *Sermons Preached at Winchester College*, 1844; and *Sermons on the Beatitudes*, 1860. He delivered the Bampton lectures for 1868, which appeared under the title of *The Administration of the Holy Spirit in the Body of Christ;* and he was one of the "five clergymen" who published revised versions of various books of the New Testament between 1857 and 1870.

MO'BILE, MOBILIZE', an adjective and verb, used respectively in regard to continental armies, to designate a state of readiness for taking the field, and the act of making ready for such an operation. The process consists in augmenting a regiment from its peace to its war complement, in calling in men on furlough, in organizing the staff of divisions and brigades, constituting the commissariat, medical, artillery, and transport services, and in accumulating provisions and munitions. As the work of mobilizing an army causes great and inevitable expense, it is only resorted to when hostilities appear imminent.

MOBILE, a co. in s.w. Alabama, having the state line of Mississippi for its western border, the Mobile bay and the Mobile river flowing into it for its e. boundary, and the gulf of Mexico on the s.; drained by the Escatowpa river; 1500 sq.m.; pop. '80, 48,602—44,709 of American birth, 21,426 colored. It is intersected by the Mobile and Ohio railroad, the New Orleans, Mobile and Texas, and the Mobile and Alabama Grand Trunk. Its surface is generally level, a large proportion being covered with pine forests growing on sandy hills. Its climate is healthy, and the water is pure. Live stock is raised. All the products of the southern states are found here, the soil being a productive, sandy loam. Lumber and rice are the chief products. Dauphin island lies directly s., the site of a French settlement in 1702, called Massacre island from the quantities of bones found there, and was the occasional seat of the colony of Louisiana in early times. From its county seat steamboats run to Montgomery, Tuscaloosa, and New Orleans, carrying on an important commerce. Its bay will admit vessels of 21 ft. draught, and the harbor of Mobile vessels drawing 13 ft., and cotton is largely exported; also, cigars, staves, shingles, resin, and turpentine. Its industries include the manufacture of tin, copper, engines and boilers, tar, and turpentine. Seat of justice, Mobile.

MOBILE, the principal city and only seaport of Alabama, is situated on the w. side of Mobile river, and at the head of Mobile bay, which opens into the gulf of Mexico. It is built with broad shaded streets on a sandy plain, rising gradually from the river, with a fine custom-house and post-office, city hall and market-house, theater, odd fellows' hall, cathedral, 30 churches, 4 orphan asylums, several hospitals, a medical college, St. Joseph's college (a Jesuit institution), a convent of the visitation, and academy for young ladies. Mobile has several ship-yards, foundries, and cotton-presses. Its chief business is the export of cotton. The average export for five years preceding the civil war was 632,308 bales; in 1874–75, 131,343 bales, value $9,054,110, were exported. There is also a large exportation of turpentine, resin, and tar. Its harbor is defended by fort Morgan. Mobile was settled by the French in 1702. Pop. '70, 32,034.

MOBILE (*ante*). The city is 6 m. in length by 2 or 3 broad; pop. '80, 31,205; a decline from 1870 of 729. It is chiefly inhabited along the line of the river and to a distance of about a mile inland; is lighted by gas, and has an excellent water supply from a distance of 5 m.; it has also sufficient horse-railroad facilities for its local need. Mobile is connected with the general railroad system of the country by the Mobile and Ohio, Mobile and Montgomery, New Orleans, Mobile and Texas, and Alabama Grand Trunk railroads. There are also steamers to Montgomery and other river towns.—The following tables display the trade of Mobile from 1878–79 to 1884.

RECEIPTS AND SHIPMENTS—BALES OF COTTON.

Years.	Receipts.	Shipments.		
		To Foreign Ports.	To Domestic Ports.	Total.
1878-79	363,612	123,214	239,308	362,522
1879-80	359,651	111,687	243,886	355,573
1880-81	395,608	116,263	273,704	389,967
1881-82	271,417	46,366	223,755	270,121
1882-83	315,180	45,290	266,057	311,347
1883-84	264,553	57,537	204,795	262,332

VALUE OF EXPORTS AND IMPORTS.

Years.	Exports.	Imports.
1876-77	$12,812,087	$648,402
1877-78	9,464,087	1,218,442
1878-79	6,283,818	540,428
1879-80	7,187,303	425,519
1880-81	6,598,140	670,638
1881-82	3,258,608	379,073
1882-83	2,837,496	374,992
1883-84	3,837,099	283,458

By these tables it is to be observed that from 1877 to 1884 there was a general decline in the foreign trade of Mobile, as there was a falling off in the population between 1870 and 1880, according to the tenth decennial census. The early history of this city displays more than the usual proportion of disturbing influences. Originally colonized by the French, it was long the most important point in the Louisiana settlement. It was attacked by famine and by epidemic; and in 1706 was the scene of that exceptional revolt known as the "petticoat insurrection," when the women of the place became dissatisfied with Indian corn as their staple article of food, and threatened rebellion. A disastrous hurricane, accompanied by a flood, nearly destroyed the settlement in 1711, and necessitated its removal from the place where it then stood, supposed to have been a point some 20 m. from its present location. By the treaty of Paris in 1763, Mobile was transferred to the British government; but twenty years later it was ceded to the Spanish government, with all the rest of the British possessions on the gulf, and remained in the possession of Spain until 1813, when it was surrendered to gen. Wilkinson. In 1819 it was incorporated as a city. From Jan. 11, 1861, to April 11, 1864, Mobile was in the hands of the confederates. On Aug. 5, in the latter year, admiral Farragut, with his fleet, passed up Mobile bay, and the memorable engagement with the forts and the confederate ships ensued, resulting in the destruction or capture of the latter, and the surrender of forts Gaines and Morgan. Early in the following spring the place was fully invested, and the remaining fortifications carried by assault.

MOBILE BAY (*ante*), an estuary of the gulf of Mexico, in the s.w. portion of the state of Alabama. The island of Dauphin lies on the w. of the entrance, and on the e. is Mobile point, the station of a light-house with a revolving light 55 ft. high. It has an outlet on the s.w. through Grant's pass, communicating with Mississippi sound, used by steamers of light draught, and the regular course of the Mobile and New Orleans steamers. The bar, 4 m. seaward, will admit vessels of from 18 to 20 ft. draught. The depth of the bay is from 12 to 14 ft. more shallow in the n. portion than in the s., the anchorage for the cotton fleet being near the entrance, where they are loaded by lighters from Mobile. It is fed by numerous affluents of the Alabama river, flowing into the n. portion, over mud flats, changing with each season, and increasing the sedimentary deposits of the bay. At Choctaw pass, where the Mobile river enters the bay, a channel through the bar is maintained by dredging, and similar means render the Dog river navigable. Its margins are thickly wooded with groves of live oak and magnolia, especially near the n. extremity, and pine forests crown the high bluffs which rise in other portions.

MOBILE POINT, at the e. extremity of the entrance to Mobile bay, is the end of a long, narrow strip of sand which stretches between Navy Cove and the bay of Bon Secours to the n., and the gulf of Mexico to the south. Fort Morgan is situated here, on the ground once occupied by fort Bowyer. The latter fort, which was rudely and unscientifically built, was attacked from the sea in Sept., 1814, by a British squadron of 2 brigs, and 2 sloops of war, and on the land by a force of 130 marines and 600 Indians. The American garrison, numbering but 130 men, under maj. Lawrence, and defended by 20 pieces of artillery, sustained for 3 hours the attack of the British, who were forced to withdraw with a loss of 232 killed and wounded; and their flag-ship was grounded and burned. The American loss was 8. Fort Bowyer was finally captured by the British, Feb., 1815.

MOBILE RIVER AND **BAY** of Alabama. The river is formed by the confluence of the Alabama and Tombigbee, 50 m. above Mobile, which lies at its mouth. It is a sluggish stream, with low banks and several channels. The bay is 30 m. from n. to s., and 10 or 12 from e. to west. The entrance from the gulf of Mexico, 3 m. wide, is defended by fort Morgan and fort Gaines.

MOBILE RIVER (*ante*), formed in the s. extremity of Clarke co., Ala., is the boundary line between the counties of Mobile and Baldwin, and is navigable by large steamboats. Throughout its course it takes a s. direction, and, 6 m. below the junction of the rivers which form its head, it divides into two branches, the e. being called Tensas, the w. Mobile, the latter a name derived from the *Mauvilians* or *Mobilians*, a tribe of Indians.

MOBILIER, CRÉDIT. On Nov. 18, 1852, the French government sanctioned the statutes of a new bank under the name of the *Société Général de Crédit Mobilier.* The

name was intended as a contrast to the *Sociétés de Crédit Foncier*, which are of the nature of land banks, and advance money on the security of real or *immovable* property; while the *Crédit Mobilier* proposed to give similar aid to the owners of *movable* property. The declared object of this bank is especially to promote industrial enterprises of all kinds, such as the construction of railways, sinking of mines, etc. Various privileges were conferred upon it under its charter; in especial, it was allowed to acquire shares in public companies, and to pay the calls made upon it in respect of such shares by its own notes or obligations; also to sell or give in security all shares thus acquired. The operations of the society were conducted upon a very extensive scale. In 1854 it subscribed largely to the government loan on account of the Russian war, to the Grand Central railway company, to the General Omnibus company of Paris, and to various other important undertakings. The dividend for this year was 12 per cent. In 1855 it lent two sums to the government—the one of 250 and the other of 375 millions of francs. Its operations were vast during this year, and the dividends declared amounted to 40 per cent. The directors had not hitherto availed themselves of their privilege of issuing their own obligations, but this they now resolved on doing. They proposed to issue two kinds—the one at short dates; the other at long dates, and redeemable by installments. The proposed issue was to amount to 240 millions of francs; but the public became alarmed at the prospect of so vast an issue of paper-money, so that in Mar., 1856, the French government deemed it necessary to prohibit the carrying out of the proposed scheme. This was a severe blow to the institution. In 1856 its dividends did not exceed 22 per cent; in 1857 they were only 5 per cent. Several attempts had been made to resuscitate its credit, but failed. In 1875 it was put under a new board of management, who reported its assets at 77,000,000 francs. In 1876 the 500-franc shares were quoted at 200 francs. The Crédit Mobilier has undoubtedly been highly useful in developing the industrial power of France, but its operations have been hazardous, and had they not been checked in time, they would in all probability have ended in disaster.

MÖBIUS, August Ferdinand, 1790–1868, b. Germany; educated at Leipzig, where he was professor of astronomy from 1815. He reorganized the Leipzig observatory, and published a number of astronomical treatises, of which the best known are *Elements of Celestial Mechanics*, 1843, and *Principles of Astronomy*. His *Manual of Statics* treats of the relation between geometry and statics.

MOCCASIN SNAKE or Water Moccasin, also called *cotton mouth*, the *ancistrodon piscivorus*, a venomous serpent inhabiting the southern part of the United States. It has a length of about 2 ft.; color dark brown above and a gray belly. It lives in swamps and wet places and frequents the water. It is one of the most aggressive of all serpents, and its bite is of the most dangerous character.

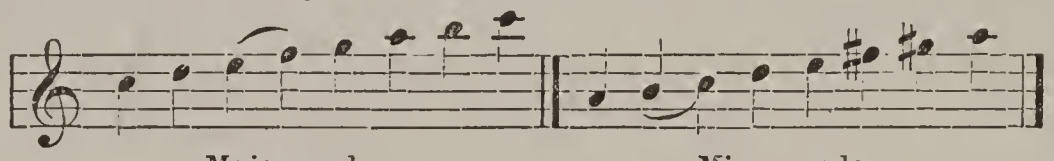
MO'CHA, the most strongly fortified seaport, and once the capital, of the province of Yemen, in Arabia. It is situated on the Red sea, at the head of a little bay near the strait of Bab-el-Mandeb, and 130 m. w.n.w. of Aden (q.v). All round the shore is a hot sandy waste. The principal trade is in coffee, of which 10,000 tons (of the finest quality) are annually exported to Jiddah, Suez, and Bombay. Other exports are dates, gums, balm, ivory, senna, etc. Pop. 5,000.

MOCHA STONES are pieces of agate or of chalcedony, containing dendritic infiltrations, often assuming appearances very like finely ramified confervæ, etc. They receive the name mocha stone because, when they first became known in Europe, they were brought from Mocha. Of the same nature with mocha stones are *moss agates*. The resemblance of the inclosed infiltrations to plants is often merely accidental, but it appears to be sometimes really due to plants, which were inclosed in the cavity in which the silicious mineral itself was formed.

MOCKING-BIRD, or Mocking-Thrush (*Mimus* or *Orpheus*), a genus of birds of the family *merulidæ*, having a more elongated form than the true thrushes, a longer tail, shorter wings, and the upper mandible more curved at the tip. They are all American. The best known species, the mocking-bird of the United States (*M. polyglottus*), is about the size of the song-thrush; the upper parts of a dark brownish ash color, the wings and tail nearly black, the under parts brownish white. The mocking-bird is common in all parts of America, from the s. of New England to Brazil; n. of the Delaware, it is only a summer visitant, but in more southern regions it is found at all seasons. It is one of the most common birds of the West Indies, and its exquisite song fills their groves with melody by night, for which reason it is there very generally known as the nightingale. By day, the mocking-bird is generally imitative, excelling all birds in its power of imitation, now taking up the song of one bird, and now of another, and often deceiving the most practiced ear by its perfect performance. By night, its song is for the most part natural. It does not confine itself, however, to musical strains; it seems to take equal pleasure in repeating the harshest cries of the feathered tribes; and in domestication readily adds to its accomplishments the imitation of almost any sound which it is accustomed to hear, passing from one to another with great rapidity, so as to produce an incomparable medley. The mocking-bird readily learns to whistle a tune, even of considerable length, but there is no well-authenticated instance of its imitating the human voice. The barking of a dog, the mewing of a cat, the crowing of a cock, the cackling

of a hen, the creaking of a wheelbarrow, are all within the compass of its powers. During its performances, it spreads its wings, expands its tail, and throws itself about as if full of enthusiasm and enjoyment. The mocking-bird is vocal at all seasons of the year. It enjoys almost everywhere the protection of man, and often makes its nest in a tree or bush close beside a house. Two or three broods are produced in a year. The male is extremely attentive to his mate, and manifests extraordinary courage in driving away enemies from the nest. Mocking-birds often assemble on such occasions, and birds of prey, far superior to them in size and strength, are compelled to retreat. Snakes are killed by reiterated blows on the head, and cats learn to consider the vicinity of a mocking-bird's nest unsafe. The food of the mocking-bird consists chiefly of berries and insects. Another species of mocking-bird is found in the Rocky mountains, and species of the same genus are among the finest song-birds of the temperate parts of South America.

MODE, in music. Every musical passage is referable to and forms part of a succession of sounds having some appreciable relation to one another. This succession of sounds is called the scale, and is a series of steps leading from a given note called the key-note, or tonic (q.v.), to its octave. The steps or degrees of the scale are of unequal size, and on the place of the smaller ones or semitones depends the mode of the music. Taking our natural scale, there are only two notes in it which can satisfy the ear as key-notes—



Major mode. Minor mode.

viz., C and A. In the major mode, with C as key-note, the semitone or small interval falls between the third and fourth sounds; in the minor mode, with A as key-note, it falls between the second and third sounds; in the former case, the third of the key-note is a major third, in the latter a minor third. The minor mode further requires to be modified by occasionally sharpening its sixth and seventh, in order to be pleasing to modern ears. The scale of the major mode is derived from simpler harmonic proportions than that of the minor. Melodies composed in the latter mode have generally more or less of a plaintive or melancholy character. For the theory of these modes, see Music. Ancient musicians admitted of a greater variety of modes. The Greeks had six, designated the Dorian, Phrygian, Lydian, Mixo-Lydian, Ionic, and Æolian. The Ionic is the modern major, the Æolian the minor mode; the others are more or less intolerable to a modern ear. They are used to a limited extent in the music of the Greek church, and in the Ambrosian chant.

MODE (*ante*), in music, a term applied to the two varieties, major and minor, of the diatonic scale, or series of tones employed in modern music. It is more rarely used for key, as "the twelve major and twelve minor modes or keys." In the old Greek music each note could become, as in the modern, the key-note of a new key or scale; but, as there was no introduction of new semitones, this change of key became a change of mode in the same sense as our major and minor. At first there were only four Greek modes—the Dorian, Phrygian, Lydian, and Myxo-Lydian—but later the Ionian and the Æolian modes were added. St. Ambrose chose the first four for use in the church in the 4th c., and St. Gregory introduced the others 200 years later. They were termed ecclesiastical modes, and gave rise to the eight "Gregorian tones" or chants.

MOD'ELING is the process of preparing the original pattern or design from which a work in sculpture is to be cast or carved: the technical details will be found under Sculpture. Modeling is also practiced by medalists; the head or figure intended to be cut in the die being first modeled in relief with wax on a piece of slate. Goldsmiths, silversmiths, and jewelers also model intricate and artistic forms and ornaments of pieces of plate, to be cast and chased by them, or in which jewels are to be set. Wax is the substance used when delicacy and minuteness are required. Modeling is also a branch of the potter's trade. Flaxman modeled for Wedgwood numerous figures and groups in wax. For large models, the material employed is potter's clay, which, when used by sculptors, is mixed with a portion of sandstone, finely pulverized, to make it work freely.

MODENA, formerly a duchy of Italy, in the n., between the Po and the Mediterranean. It was bounded on the n. by Lombardy and the papal states, on the e. by Tuscany and the papal states, on the s. by Tuscany, Sardinia, and the Mediterranean, and on the w. by Sardinia and Parma. Area, 2,371 sq.m.; pop. in 1860, about 600,000. The only rivers of importance are the Margra and the Serchio, which empty into the Mediterranean. The n.e. part of the duchy is fertile, like the Lombard plain, to which it belongs. The vine is extensively cultivated, and the other chief productions are wheat, maize, hemp, and flax. For the history of the duchy, see Modena, the capital. The modern province of Modena comprises the provinces Modena and Frignana of the old duchy. Area, 966 sq.m.; pop. '81, 279,405.

MO'DENA (anc. *Mutina*), capital of the former duchy of same name, a fortified city of Northern Italy, 24 m. w.n.w. of Bologna. Pop. '81, 31,053. It stands between the rivers Secchia and Panaro, in a pleasant plain, noted for its rich soil and salubrious air.

and from its surrounding ramparts commands fine views of the Apennines. Although the social life of Modena is somewhat stagnant, it is, nevertheless, a most agreeable city. It lies on the famous Via Æmilia (see EMILIAN PROVINCES), by which it is divided into the old and new city, and is connected by a navigable canal with the rivers Secchia and Panaro. Among the public buildings may be noted the cathedral of St. Geminianus, the patron of the city, a structure of the purely Lombard style. The campanile or belfry is one of the great towers of Italy; it is a square turreted structure, 315 ft. in height, its entire façade being in white marble. The ducal palace, a picturesque structure of the 17th c., is adorned with an infinity of galleries, courts, and marble arches; it contains the splendid Biblioteca Estense, numbering 100,000 volumes, and 3,000 rare MSS.; also the valuable Este archives, a most important collection of mediæval records, collections of coins and medals of great antiquity, and an observatory. Schools of theology, law, medicine, and mathematics have replaced the university suppressed in 1821; there are also fine museums of natural history, a botanic garden, theaters, and good public baths. The trade of Modena is unimportant: the manufactured products are confined to linen and woolen fabrics, leather, hats, paper, glass, and pottery, besides silk manufactured to a much less extent than formerly. Modena is the birthplace of the great anatomist Fallopius, and the antiquary Sigonio.

The ancient history of Modena affords evidence that it enjoyed at an early period a considerable degree of prosperity; the splendor, wealth, and arts of the city of Modena being mentioned by Cicero, Pliny, and Strabo. In modern times Modena has shared more or less the various vicissitudes which befell Italy, and participated in the great internecine feuds of the country. In 960 a member of the great house of Este was proclaimed marquis of Modena, and in 1452 the then reigning marquis was created duke by the emperor Frederick III. In 1796 Modena formed part of the Cisalpine Republic, but was restored in 1814 by the congress of Vienna to the reigning family. The duchy had at that time an area of 2,310 sq.m., and a pop. of 586,000. In 1848 the duke of Modena was temporarily deprived of his rights; and in 1860 the population definitively expelled their unpopular ruler, who carried off all the property and valuables within his reach, including the silver handles of the palace doors. Modena is now a province of the kingdom of Italy: area 960 sq.m.; pop. '71, 273,231.

MOD'ERATOR, a term used in Scotch ecclesiastical law to describe the chairman or president of a Presbyterian church-court.

MODICA, the Mohac of the Saracens, a city of the island of Sicily, in the province of Val di Nota, 30 m. from Syracuse. Pop. '81, 37,919. The city, which stands perched amid rocks, contains several fine buildings, and, notwithstanding the humidity of the climate, the sanitary condition of the inhabitants seems satisfactory. The soil of the surrounding district is the most productive of Sicily, and yields vast quantities of corn, tobacco, oil, wine, hemp, which, with cheese, wool, soda, and butter, form the chief export trade of the place. The valley of Ipsica, or Ispica, in the vicinity of Modica, contains remarkable rocks, in which numerous dwellings are excavated.

MODIL'LION, an ornamental bracket much used in classic architecture, especially in the cornices of the Corinthian and Composite styles.

MODJESKA, HELENA. See page 882.

MODOC : co., Cal. See page 882.

MODOCS, the name of a tribe of American Indians, meaning "enemies," and applied to them by a hostile tribe. The Modocs formerly belonged to the Klamaths (q.v.), but became estranged from them and eventually antagonistic. They are supposed to have originated on the shores of lake Klamath in California. They were dull and lethargic by nature, unimpressible, with little expression to their features, and little energy or activity in their movements and habits. They had the custom of making slaves of their prisoners of war, and of buying and selling these, after the fashion of the ancient Romans and Carthaginians. They had a religion, in which a mythical deity whom they called Komoose, stood in the place of a god. In 1847 and 1849 they are said to have conducted predatory excursions against the whites. A year later capt. Nathaniel Lyon fought a band of these Indians on Clear lake, Modoc co., Cal., and defeated them, inflicting severe and merited chastisement. But by 1852 the Modocs appear to have forgotten this infliction, or remembered it with an unwise disposition for vengeance, for they again indulged in a massacre of white settlers, and invited fresh retribution. This was effected in a manner not according to the laws of civilized warfare, however, for the Modocs were invited by the whites to attend a pow-wow and feast, presumably of a peaceful character, and, of the 46 who accepted the invitation, 41 were ruthlessly murdered. After this act warfare continued for many years. In 1856 a campaign against them was carried out by gen. Crosby, and a large number were slaughtered. This did not put an end to the war, however, which continued until 1864, when they acceded to the stipulations of a treaty, ratified and proclaimed early in 1870. By this treaty they agreed to give up their lands to the U. S. government, and to go upon a reservation to be set apart for them. They did, in fact, go upon two different reservations, but these were already occupied by their enemies, the Klamaths, a fact which kept them continually in trouble. Two chiefs had now begun to obtain considerable notoriety, not alone on the frontier, but among the settled states. These were capt. Jack, who was the leader of a band of Modocs that was making itself particularly obnoxious to the whites; and Schonchin, hereditary chief of the tribe, whose followers were less objectionable. In 1868 capt.

Jack, with his party, moved to Lost river, where they remained until 1872, when orders were given by the superintendent of Indian affairs to return them to the reservation. Troops from fort Klamath were sent against their camps, and after some fighting they were dislodged, and retreated to a district known as the "lava beds," near fort Klamath, Oregon, where they were enabled to strongly intrench themselves, owing to the peculiar natural formation of the country. On Jan. 17, 1873, the troops under gen. Wheaton entered the lava beds and attempted to drive out the Modocs, but with such ill success that they were even unable to approach nearer to them than a distance of 2 or 3 miles. The troops lost 11 killed and 21 wounded, and were forced to retire. A second attempt was made under the command of gen. Gillem, but this also resulted in failure. Commissioners were now appointed by the government to confer with capt. Jack, and endeavor to bring about a peaceful settlement of the existing troubles. A meeting was arranged for April 11, 1873, which took place according to appointment, but was treacherously concluded by the Modocs, who fired upon the commissioners, with the result of killing outright gen. Canby and Dr. Thomas, and wounding Mr. Meacham, also a commissioner. This act broke up the conference, and a fierce fight ensued, the Modocs resisting desperately until starved out and forced to surrender, an event which did not occur until nearly two months later. The troops during this part of the siege were commanded by gen. Jeff. C. Davis, to whom belongs the honor of having at length forced the stubborn savages to acknowledge their defeat. A military commission was now appointed to try the chief offenders, and capt. Jack, Schonchin, jr., and two other Modocs were condemned to die. They were accordingly executed at fort Klamath, Oct. 3, 1873. The remainder of the band were retired to a reservation in the Indian territory.

MODULA'TION, in music. When in the course of a melody the key-note is changed, and the original scale altered by the introduction of a new sharp or flat, such change is called modulation. Much of the pleasure of music is derived from a judicious use of modulation. The art of good modulation from one key to another consists in the proper choice of intermediate chords. Sudden transitions, without intermediate chords, should be employed but sparingly, and in peculiar circumstances. Every piece of music is composed in a particular key, in which it begins and ends, which generally predominates over any other keys that may be introduced in the course of the composition.

MOD'ULE, in classic architecture, an arbitrary measure for determining the proportions of the various members of the orders. The diameter, semi-diameter, or one-third of the diameter are most frequently used; the first being usually divided into 60 parts (or minutes), the second into 30 parts, and the third into 20 parts.

MOD'ULUS, a constant coefficient or multiplier, by means of which one series or system of quantities can be reduced to another similar series or system. Thus we have the modulus of elasticity (q.v.), of friction (q.v.), and of systems of logarithms (q.v.). The system of logarithms which is universally accepted as the primary is Napier's, and from it all other systems are deduced in the following manner: Let N be a number of which the Napierian logarithm is b, e being the Napierian base, it is required to find the logarithm of N to some other base a. Let x be this logarithm, then (see LOGARITHMS) $N=e^b=a_x$, and, taking the Napierian logarithms of both sides of this equation, $b \log._e e=x \log._e a$, or (since $\log._e e=1$) $b=x \log._e a$, therefore $x=\frac{b}{\log._e a}$; i.e., $\log._a N=\frac{\log._e N}{\log._e a}=\frac{1}{\log._e a}\times \log._e N$. This multiplier, or "modulus," $\frac{1}{\log._e a}$, is independent of N, and is therefore constant for the reduction of all Napierian logarithms to the system whose base is a. If $a=10$, the multiplier becomes $\frac{1}{\log._e 10}$, the modulus of Briggs's, or the common system of logarithms, and is equal to $\frac{1}{2.30258509}=.4342944....$

MO'DUS, in English law, means a peculiar custom by which lands become exempted from payment of tithes on paying some composition or equivalent.

MÖ'EN, a Danish island in the Baltic sea, separated from Seeland on the n.w. by the *Ulfsund*, and from Falster on the s.w. by the *Grönsund*. It is 19 m. long, by about 5 m. in average breadth. Area, 84 sq. miles. Pop. about 15,000, who are supported by agriculture, fisheries, and commerce. It has been called the Switzerland of Denmark, and is remarkable for the irregularity of its surface. The soil is fruitful. Its chief town and seaport, Stege, has a pop. '70, 1960.

MŒ'RIS, LAKE, the ancient name of a sheet of water in Egypt, now known as *Birket-el-Kerûn*, or *El-Korn* ("the lake of the promontory"), is situated in the province of Fayûm, about 50 m. s.w. of Cairo; extreme length from n.e. to s.w., 30 m.; breadth, 6 m.: it was formerly much larger. Its average depth is 12, and its greatest ascertained depth 28, feet. On the n. and w., its shores are rocky, but on the s., flat and sandy. It is connected with the Nile by a canal called *Bahr-Jusuf* ("the river of Joseph"). The waters are brackish, on account of their being impregnated with the alkaline salts of the desert, and with the muriate-of-lime depositions of the surrounding hills. In the time of the Pharaohs, the revenue derived from the fisheries was applied to the maintenance

of the queen's wardrobe and perfumes. Under the Persians, they were let (during the season of the inundations, when the canal fed the lake) at £150 a day. At present, however, they only yield about £84 a year.

MŒ'SIA, an ancient Roman province, bounded by the Danube on the n., the Black sea on the e., the mountain-chains of *Hæmus* (Balkan) and *Orbelus* on the s., that of *Scardus* and the rivers *Drinus* (Drina) and *Savus* (Save) on the west. The river *Ciabrus* (Cibriz) divided it into two parts, of which the eastern (*Mœsia inferior*) is the present Bulgaria, and the western (*Mœsia superior*) is Servia. Its original inhabitants were mostly of Thracian race. Gaulish or Celtic invaders settled in western Mœsia about 277 B.C., under the name of *Scordisci.* The Romans first came in contact with the tribes of Mœsia after the conquest of Macedonia, when C. Scribonius Curio forced his way as far n. as the Danube, and gained a victory over the Mœsians (75 B.C.), but the country was not completely subjugated till 29 B.C. It was made a Roman province in the reign of Augustus, and flourished for more than two centuries, but as a frontier province it was much exposed to hostile invasions, and required a line of fortresses and stations all along the s. bank of the Danube. In 250 A.D. the Goths made an irruption into the country, and defeated and slew the Roman emperor, Decius. In the following year, and about the end of the 4th c., it was given up to them by the emperor Theodosius I. Slavonian tribes settled in Mœsia in the 6th and 7th centuries.

MŒSO-GOTHIC GOSPELS. See ULFILAS (*ante*).

MŒSO-GOTHS, the name given to the Goths who in the 3d c. settled in lower Mœsia at the mouth of the Danube. Ulfilas (q.v.) was a Mœso-Goth. The name, however, became of more general use to designate those who remained in Mœsia after the great migration in the beginning of the 5th century.

MOFFAT, a market t. and favorite watering-place of Scotland, in the co. of Dumfries, stands in the upper part of the broad and beautiful valley of the Annan, and is surrounded by hills of moderate elevation. It was connected (1883) by a railway with the Caledonian railway, and is 19 m. n.n.e. of Dumfries. Among other public edifices are the baths and the reading and assembly rooms. The mineral springs, the principal of which, like that of Harrogate, is saline and sulphurous, are highly celebrated; but perhaps the greatest attractions of the place are its salubrious air and exquisite environs. During the season the town is increased in population by from 800 to 1000 visitors, to suit whose convenience great numbers of elegant villas, commanding fine views of the neighboring country, have been erected. Pop. '81, 2,161.—The Moffat hills extend between the counties of Lanark and Peebles in the n., and Dumfries in the s.; highest summit Hartfell, 2,650 feet. See Black's *Guide to Moffat.*

MOFFAT, ROBERT, a distinguished missionary, b. at Ormiston, East Lothian, Dec. 21, 1795. Having resolved to become a missionary to the heathen, he offered his services to the London missionary society, was accepted, and sent by them to South Africa. Arriving at Cape Town in 1817, he immediately proceeded beyond the boundaries of Cape Colony to Namaqualand, where he entered upon his labors at the kraal of Africaner, a chief whose name had long been a terror to the people of the neighboring districts of the colony, on account of the audacious raids which he made among their settlements, and his ferocious character, but who had lately become a convert to Christianity, and now showed a warm desire for its promotion. Here Moffat labored for three or four years with great success, Christianity and civilization advancing together. But the situation, on account of the drought and sterility of the country, and its very thinly scattered population, being unsuitable for a principal mission-station, he set out in search of a better locality, and labored at several stations in succession in the countries to the n. and n.e. of Cape Colony. Wherever he went, the gospel was gladly received by some of those who heard it, and in some places by many. In every place he also guided the people in the arts of civilized life. He made several missionary tours, and his adventures were very remarkable, and are graphically described in his work, *Missionary Labors and Scenes in Southern Africa* (Lond. 1842), which he wrote and published during a visit of several years to Britain, rendered necessary by the state of his health. In 1842 Moffat returned to his labors in that country, and came back to England in 1870. His daughter was the wife of the celebrated Dr. Livingstone. In 1873 he was presented with the sum of £5,800 in recognition of his great services. He lectured on African missions in the nave of Westminster abbey in 1875. He d. 1883.

MOGADO'RE, or SUE'RRA, a fortified t., and the principal seaport of Morocco, 130 m. w.s.w. of the city of that name, on the Atlantic ocean. Pop. about 20,000. It is the port of the capital, and was founded in 1760, on the site of an old Portuguese fort. It stands on a rocky promontory, opposite an island of the same name, long a haunt of pirates, which forms the harbor, and is said to be the best built town of the kingdom. Its streets are regular, though narrow, and it consists of two parts, each surrounded by water. The quarter called the Fortress contains the custom-house and the treasury, and is the residence of the pasha, the vice-consuls, and the Christian merchants. The town is defended by four batteries on the island, and by a fort on the land-side; the walls are also defensible. Mogadore is the seat of considerable trade; it exports olive-oil, wool, gum, hides, feathers, gold-dust, and almonds. In 1873, 114 vessels, of 28,907 tons,

entered, and 211, of 27,913 tons, cleared the port. The value of the cargo of those entering was £263,718; of those clearing, £259,930. The imports are woolens, cottons, hardware, etc.

MOGILA, or MOGILAS, PETER, 1597–1646; b. Moldàvia; educated at the university of Paris. After serving in the Polish army he went into a monastery at Kiev, and became metropolitan of that town in 1629. He brought to Kiev from Paris the improved methods of study and the more advanced theological studies which were as yet unknown to Russia. He set up a printing press, and founded an academy and a library, to which he gave his own collection of books. With a view to strengthen the Greek church, he published *A Confession of Faith*, which contains an exposition of its doctrines, and which remains a standard treatise on the theology of his church. He also wrote a *Catechism*, a partial hagiography, and a number of dramas in verse.

MOGUER' (Arab. "caves," of which there are many in the neighborhood), a t. of Spain, in the province of Huelva, 43 m. w.s.w. of Seville, rises gently above the Rio Tinto, near the mouth of which is its port, Palos. The streets are generally broad and straight, but both the town and castle are much dilapidated. The old Franciscan convent was ordered in 1846 to be preserved as a national memorial, but it is now fast going to ruin, and the wood of the cells stripped off. It was here, in 1484, that Columbus, craving charity, was received by the prior, Juan Perez de Marchena, by whose influence he was enabled to prosecute his discoveries, setting out from the port of Palos on Aug. 3, 1492. It was to this port also that he returned, Mar. 15, 1493, after having accomplished the great end of his expedition. Here likewise did Cortes land in May, 1528, after the conquest of Mexico and lodged in the same convent which gave shelter to Columbus. Palos is now a poor decayed fishing port. Moguer has some trade in wine and fruit. Pop. 6,600.

MOGUL', GREAT, the popular designation of the emperor of Delhi, as the impersonation of the powerful empire established in Hindustan by the Mongols (q.v.), who were called *Moguls* by the Persians. The first great Mogul was Baber, the great-grandson of Timûr, who founded the Mongol empire in Hindustan in 1526. In 1803 the great Mogul was deprived of his throne; in 1827, of even the appearance of authority, becoming a mere pensioner of the British; and in 1858, Mohammed Bahadûr, the last of the dynasty, was condemned, and transported for complicity in the Indian mutiny.

MOHACS', a market t. of Hungary, 110 m. s.s.w. of Pesth, on the western arm of the Danube. It contains a gymnasium, has an important cattle-market, is a station for steamboats on the Danube, and the seat of considerable trade in wine, coal, timber, and agricultural produce. Pop. '80, 12,385. It owes its historical importance to the great battle fought here, Aug. 29, 1526, between Louis II. of Hungary, with 25,000 Hungarians, and the sultan Soliman at the head of about 200,000 Turks. The battle resulted in the disastrous defeat of the Hungarians, who lost their king, 7 bishops, many nobles and dignitaries, and upwards of 22,000 men. A second battle was fought here on Aug. 12, 1687, when the Turks in their turn were defeated by an Austro-Hungarian army under Charles of Lorraine.

MO'HAIR, the wool of the Angora goat (see GOAT and ANGORA), a native of Asia Minor. Few animals have so beautiful a covering as the fine, soft, silky, long, and always pure white wool of this goat. Each animal, at the annual clip in April or May, yields from 2 lbs. to 4 lbs. of wool. It is only within the last 30 years that mohair has been in great request in Britain, but its development as an article of trade has been simultaneous with that of alpaca. In 1880 the amount of mohair and other goats' hair imported was 13,566,020 lbs.; the value, £1,233,855. See WOOLEN MANUFACTURES.

MOHAM'MED (Arab. *the Praised**), the name taken, at a later period, by the founder of Islam. He was originally called *Halabi*. He was born about the year 570 A.D., at Mecca, and was the son of Abdallâh, of the family of the Hâshim; and of Amina, of the family of Zuhra, both of the powerful tribe of the Koreish, but of a side-branch only, and therefore of little or no influence. His father, a poor merchant, died either before or shortly after Mohammed's birth, whom his mother then (according to a doubtful tradition) is supposed to have handed over, after the fashion of her tribe, to a Bedouin woman, that she might nurse him in the salubrious air of the desert. In consequence of the repeated fits of the child, however, which were ascribed to demons, the nurse sent him back in his third year. When six years old he also lost his mother. His grandfather, Abd-Al-Mutallib, adopted the boy; and when, two years later, he, too, died, Mohammed's uncle, Abu Talib, though poor himself, took him into his house, and remained his best friend and protector throughout his whole life. The accounts which have survived of the time of his youth are of too legendary a nature to deserve credit; certain, however, it seems to be that he at first gained a scanty livelihood by tending the flocks of the Meccans, and that he once or twice accompanied his uncle on his journeys to southern Arabia and Syria. In his 25th year he entered the service of a rich widow named Chadîdja, likewise descended from the Koreish, and accompanied her car-

* Or, according to Deutsch, whose view is fully corroborated and adopted by Sprenger in his *Leben und Lehre Mohammads*, in allusion to Hag. ii. 7, *the predicted Messiah*.

avans—in an inferior capacity, perhaps as a camel-driver—to the fairs. Up to that time his circumstances were very poor. Suddenly his fortune changed. The wealthy, but much older, and twice widowed Chadîdja offered him her hand, which he accepted. She bore him a son, Al-Kâsim—whence Mohammed adopted the name Abu Al-Kâsim—and four daughters: Zainab, Rukaija, Umm Kulthûm, and Fâtima; and afterwards a second son, whom he called Abd Manâf, after an idol worshipped among his tribe. Both his sons, however, died early. Mohammed continued his merchant's trade at Mecca, but without much energy, spending most of his time in solitary contemplations. In his 35th year he is said to have, by chance only, been chosen arbiter in a quarrel about the replacing of the sacred black stone in the Kaaba (q.v.); but not before his 40th year is there anything really important to be told of his life.

Before, however, entering on the weighty events of the subsequent period, it is by no means unimportant to advert to such traits of Mohammed's outward appearance as are yet recoverable. He was of middle height, rather lean, but broad shouldered, and altogether of strong build; slightly-curled black hair flowed round his strongly developed head; his eyes, overhung with thick eyelashes, were large and coal-black; his nose, large and slightly bent, was well formed. A long beard added to the dignity of his appearance A black mole between his shoulders became afterwards among the faithful "the seal of prophecy." In his walk he moved his whole body violently, "as if descending a mountain." His gait and presence were altogether of an extremely imposing nature. In his 40th year Mohammed received his first "revelation," or, in other words, became first aware that he had a "mission." About the year 600 A.D., Christianity had penetrated into the heart of Arabia, through Syria on the one, and Abyssinia on the other hand. Judaism no less played a prominent part in the peninsula, chiefly in its northern parts, which were dotted over with Jewish colonies, founded by emigrants after the destruction of Jerusalem; and round about Yathrib (Medina). Besides these two all-important religious elements, several sects, remnants of the numerous ancient sects which had sprung up everywhere during the first Christian centuries: Sabians, Mandeans, etc., on the frontiers of Syria and Babylonia, heightened the religious ferment which, shortly before the time of Mohammed, had begun to move the minds of the thoughtful. At that time there arose, according to undoubted historical accounts, several men in the Hedjaz (Waraka, Obeid Allah, Othman, Zayd, etc.), who preached the futility of the ancient pagan creed, with its star-worship, its pilgrimages and festive ceremonies, its temples and fetiches. It had in reality long ceased to be a living faith, and only the great mass of the people clung to it as to a sacred inheritance from times immemorial. The unity of God, the "ancient religion of Abraham," was the doctrine promulgated by these forerunners of Mohammed, and many of those who, roused by their words, began to search for a form of religion which should embody both the traditions of their forefathers and a purer doctrine of the divinity, turned either to Judaism or to Christianity. The principal scene of these missionary labors was Mecca, then the center of the pilgrimages of most of the Arabian tribes, and where, from times immemorial, long anterior to the city itself, the Kaaba (q.v.), Mount Arafat, the valley of Mina, etc., were held sacred—the Koreish, Mohammed's tribe, having the supreme care over these sanctuaries ever since the 5th century. It was under these circumstances that Mohammed felt "moved" to teach a new faith, which should dispense with idolatry on the one, as with Judaism and Christianity on the other hand. He was 40 years of age, as we said, when he received the first "divine" communication in the solitude of the mountain Hirâ, near Mecca. Gabriel appeared to him, and in the name of God commanded him to "read"—that is, to preach the true religion, and to spread it abroad by committing it to writing (Sur. xcvi.). How far Mohammed was a "prophet," in the common sense of the word, has been the subject of endless and utterly futile discussions in the Christian world. That he was no vulgar impostor is now as generally recognized as that other once popular doctrine, that he was in league with the devil, is rejected by thinking men. What part his epilepsy had in his "visions," we are not able to determine. Certain it is that, after long and painful solitary broodings, a something—not clearly known to himself—at times moved him with such fearfully rapturous vehemence that, during his revelations, he is said to have roared like a camel, and to have streamed with perspiration; his eyes turned red, and the foam stood before his mouth. The voices he heard were sometimes those of a bell, sometimes of a man, sometimes they came in his dreams, or they were laid in his heart. Waraka, one of his wife's relatives, who had embraced Judaism, spoke to him of the Jewish doctrine, and told him the story of the patriarchs and Israel; not so much as it is told in the Bible, but in the Midrash; and the gorgeous hues of the legendary poetry of the latter seem to have made as deep an impression on Mohammed's poetical mind as the doctrine of the unity of God and the *morale*—in its broad outlines—of the Old Testament, together with those civil and religious laws, scriptural and oral, which are either contained as germs or fully developed in this record. Christianity exercised a minor influence upon him and his spiritual offspring. All his knowledge of the New Testament was confined to a few apocryphal books, and with all the deep reverence before Jesus, whom, together with Moses, he calls the greatest prophet, next to himself, his notions of the Christian religion and its founder were excessively vague. For some details on these points, however, we must refer to KORAN and MOHAMMEDANISM.

His first revelation he communicated to no one, it would appear, except to Chadîdja, to his daughters, his step-son Ali, his favorite slave Zaid—whom he had probably freed and adopted by this time—and to his friend, the prudent and honest Abu Bekr. His other relatives rejected his teachings with scorn. Abu Lahab, his uncle, called him a fool; and Abu Talib, his adoptive father, although he never ceased, for the honor of his family, to protect him, yet never professed any belief in Mohammed's words. In the fourth year of his mission, however, he had made 40 proselytes, chiefly slaves and people from the lower ranks; and now first some verses were revealed to him, commanding him to come forward publicly as a preacher, and to defy the scorn of the unbelievers. With all his power he now inveighed against the primeval superstition of the Meccans, and exhorted them to a pious and moral life, and to the belief in an all-mighty, all-wise, everlasting, indivisible, all-just, but merciful God, who had chosen him as he had chosen the prophets of the Bible before him, so to teach mankind that they should escape the punishments of hell, and inherit everlasting life. God's mercy—this was a primitive doctrine, common to the whole east—was principally to be obtained by prayer, fasting, and almsgiving. The belief in the sacredness of the Kaaba and the ceremonies of the pilgrimage was too firmly rooted in his and the people's minds not to be received into the new creed; but certain barbarous habits of the Bedouins, such as the killing of their new-born daughters, were ruthlessly condemned by Mohammed. The prohibition of certain kinds of food also belongs to this first period, when he as yet entirely stood under the influence of Judaism; the prohibition of gambling, usury, etc., probably being of a somewhat later date. Whether he did or did not understand the art of writing and reading at the commencement of his career, is not quite clear; certain it is that he pretended not to know it, and employed the services of amanuenses for his Koranic dicta, which at first consisted merely of brief, rhymed sentences, in the manner of the ancient Arabic soothsayers. [KORAN.] The Meccans did not object to his doings; they considered him a common "poet" or "soothsayer," who, moreover, was not in his right senses, or simply a liar. Gradually, however, as the number of his converts increased, they began to pay more and more attention to his proceedings; and finally, fearing mostly for the sacredness of Mecca, which the new doctrine might abolish, thus depriving them of their chief glory and the ample revenues of the pilgrimages, they rose in fierce opposition against the new prophet and his adherents, who dared "to call their ancient gods idols, and their ancestors fools." Many of the converted slaves and freedmen had to undergo terrible punishments; and others suffered so much at the hands of their own relatives that they were fain to revoke their creed; so that the prophet himself advised his followers to emigrate to Abyssinia. Mohammed himself, although protected by the strong arm of Abu Talib, was yet at that time so low-spirited and fearful, that he even raised the idols, which hitherto he had represented as nought, to intermediate beings between God and man—a dictum, however, which he soon revoked as an inspiration of Satan, thereby increasing the hatred of his adversaries, at whose head stood two members of the family of Machzûm, Al-Walid and Abulhakam Amr (called by Mohammed "Father of Foolishness"), and who in every way tried to throw ridicule on him. At last it became necessary that he should be put beyond the reach of his persecutors, and Abu Talib hid him in a fortified castle of his own in the country. Hamza, his uncle, and Omar, formerly a bitter enemy of Mohammed, and who afterwards, with Mohammed and Abu Bekr, became the third head of Islam, continued in the meantime to spread the new doctrine. The Koreish now demanded that Mohammed should be delivered into their hands; but Abu Talib steadfastly refused to comply with their wishes; a feud thereupon broke out between their family and that of the Hashemites, and Mohammed and all the members of his family, except, perhaps, Abu Lahab, were excommunicated. After the space of three years, however, the "peace party" in Mecca brought about a reconciliation, and Mohammed was allowed to return. A great grief befell him at this time—his faithful wife Chadîdja died, and, shortly afterwards, his uncle Abu Talib, and, to add to his misery, the vicissitudes of his career had reduced him by this time to poverty. An emigration to Taïf, where he sought to improve his position, proved a failure; it was with great difficulty that he escaped with his bare life. During this epoch he had the well-known dream of his journey to Jerusalem and in the heavens on the back of the Borak (Miraj), the relation of which caused even his stanchest adherents to smile at his hallucination. Shortly after his return from Taïf he married Sauda, and afterwards so increased the number of his wives that at his death he still left nine, of whom Ayishah, the daughter of Abu Bekr, and Hafsa, the daughter of Omar, are best known. In the midst of his vain endeavors to find a hearing in his own city, and those near it, he succeeded, during a pilgrimage, in converting several men from Medina, whose inhabitants had long been accustomed to hear from the mouths of the numerous Jews living in the city and its neighborhood the words Revelation, Prophecy, God's Word, Messiah: to the Meccans mere sounds without any meaning. The seed sown into the minds of these men bore a fruitful harvest. The next pilgrimage brought 12, and the third more than 70 adherents to the new faith from Medina, and with these he entered into a close alliance. Mohammed now conceived the plan to seek refuge in the friendly city of Medina, and about 622 (10, 13, or 15 years—according to the different traditions—after his first assuming the sacred office) he fled thither, about 100 families of his faithful flock having preceded him some time before, accompanied by Abu Bekr, and reached, not

without danger, the town, called thence Medinat Annabi (city of the prophet), or Medina "City," by way of eminence; and from this flight, or rather from the first month of the next Arabic year, dates the Mohammedan era [Hedjrah]. Now everything was changed to the advantage of the prophet and his religion; and if formerly the incidents of his life are shrouded in comparative obscurity, they are, from this date, known often to their most insignificant details. Formerly a despised "madman or impostor," he now assumed at once the position of highest judge, lawgiver, and ruler of the city and two most powerful Arabic tribes. His first care was directed towards the consolidation of the new worship, and the inner arrangements in the congregation of his flock; his next chief endeavor was to proselytize the numerous Jews who inhabited the city, to whom, besides having received their principal dogmas into his religion, he made many important concessions also in the outer observances of Islam, and concluded alliances with many of their tribes; but he was sorely disappointed in his hopes to convert them. They ridiculed his pretension to be the Messiah, and so enraged him by their constant taunts that he soon abrogated his concessions, and became their bitterest adversary up to the hour of his death. The most important act in the first year of the Hegira was his permission to go to war with the enemies of Islam in the name of God—a kind of manifesto chiefly directed against the Meccans. Not being able at first to fight his enemies in open field, he endeavored to weaken their power by attacking the caravans of the Koreish on their way to Syria. Being successful enough to disturb their trade, and, at the same time, to conclude alliances with the adjoining Bedouin tribes, he at last dared to break even the peace of the sacred month of Radjab, and with this the signal to open warfare was given. A battle, the first, between 314 Moslems and about 600 Meccans was fought at Badr, in the second year of the Hegira; the former gained the victory, and made many prisoners. A great number of adventurers now flocked to Mohammed's colors, and he successfully continued his expeditions against the Koreish and the Jewish tribes, chiefly the Beni Keinukâ, whose fortified castles he took after a long siege. Notwithstanding a severe loss which he suffered in the battle near Ohod, in which he himself was dangerously wounded, his power increased so rapidly that in the sixth year of the Hegira already he was able to proclaim a public pilgrimage to Mecca. Although the Meccans did not allow this to be carried out, he gained the still greater advantage that they concluded a formal peace with him, and thus recognized him as an equal power and belligerent. He was now allowed to send his missionaries all over Arabia, and even beyond the frontiers, without any hindrance; and in the following year he had the satisfaction of celebrating the pilgrimage for three days undisturbed at Mecca. Shortly afterwards, during his expeditions against the Jews of Chaibar and Fadak, Mohammed very nearly lost his life: a Jewess, Zainab by name, a relative of whom had fallen in the fight against him, placed a poisoned piece of roast meat before him, and although he merely tasted it, he yet, up to his death, suffered from the effects of the poison. His missionaries at this time began to carry his doctrines abroad, to Chosroes II., to Heraclius, to the king of Abyssinia, the viceroy of Egypt, and the chiefs of several Arabic provinces. Some received the new gospel; but Chosrû Parvis, the king of Persia, and Amru the Ghassanide, rejected his proposals with scorn, and the latter had the messenger executed. This was the cause of the first war between the Christians and the Moslems, in which the latter were beaten with great loss by Amru. The Meccans now thought the long-desired moment of revenge at hand, and broke the peace by committing several acts of violence against the Chuzaites, the allies of Mohammed. The latter, however, marched at the head of 10,000 men against Mecca, before its inhabitants had had time to prepare for the siege, took it, and was publicly recognized by them as chief and prophet. With this the victory of the new religion was secured in Arabia. While, however, employed in destroying all traces of idoltary in the besieged city, and fixing the minor laws and ceremonies of the true faith, Mohammed heard of new armies which several warlike Arabic tribes marched against him, and which were concentrated near Taïf (630). Again he was victorious, and his dominion and creed extended further and further every day. From all parts flocked the deputations to do homage to him in the name of the various tribes, either as the messenger of God, or at least as the prince of Arabia, and the year 8 of the Hegira was therefore called the year of the deputations. Once more he made most extensive preparations for a war against the Byzantines; but not being able to bring together a sufficient army, he had to be satisfied with the homage of a few minor princes on his way to the frontiers, and to return without having carried out his intention. Towards the end of the 10th year of the Hegira he undertook, at the head of at least 40,000 Moslems, his last solemn pilgrimage to Mecca, and there (on the mount Arafat) instructed them in all the important laws and ordinances, chiefly of the pilgrimage; and the ceremonies observed by him on that occasion were fixed for all times. (HAJJ.) He again solemnly exhorted his believers to righteousness and piety, and chiefly recommended them to protect the weak, the poor, and the women, and to abstain from usury.

Returned from Mecca, he occupied himself again with the carrying out of his expedition against Syria, but fell dangerously ill very soon after his return. One night, while suffering from an attack of fever, he went to the cemetery of Medina, and prayed and wept upon the tombs, praising the dead, and wishing that he himself might soon be delivered from the storms of this world. For a few more days he went about; at last, too weak further to visit his wives, he chose the house of Ayeshah, situated near a

mosque, as his abode during his sickness. He continued to take part in the public prayers as long as he could; until at last, feeling that his hour had come, he once more preached to the people, recommending Abu Bekr and Usma, the son of Zaid, as the generals whom he had chosen for the army. He then asked, like Moses, whether he had wronged any one, and read to them passages from the Koran, preparing the minds of his hearers for his death, and exhorting them to peace among themselves, and to strict obedience to the tenets of the faith. A few days afterwards, he asked for writing materials, probably in order to fix a successor to his office as chief of the faithful; but Omar, fearing he might chose Ali, while he himself inclined to Abu Bekr, would not allow him to be furnished with them. In his last wanderings he only spoke of angels and heaven. He died in the lap of Ayeshah, about noon of Monday the 12th (11th) of the third month, in the year 11 of the Hegira (8th of June, 632). His death caused an immense excitement and distress among the faithful, and Omar, who himself would not believe in it, tried to persuade the people of his still being alive. But Abu Bekr said to the assembled multitude: "Whoever among you has served Mohammed, let him know that Mohammed is dead; but he who has served the God of Mohammed, let him continue in his service, for he is still alive, and never dies." While his corpse was yet unburied, the quarrels about his successor, whom he had not definitively been able to appoint, commenced; and finally Abu Bekr received the homage of the principal Moslems at Medina. Mohammed was then buried in the night from the 9th to the 10th of June, after long discussions, in the house of Ayeshah, where he had died, and which afterwards became part of the adjoining mosque.

This, in briefest outline, is Mohammed's career. We have not been able to dwell, as we could have wished to do, with any length, either on the peculiar circumstances of his inner life, which preceded and accompanied his "prophetic" course, nor on the part which idolatry, Judaism, Christianity, and his own reflection respectively, bore in the formation of his religion; nor have we been able to trace the process by which his "mission" grew upon him, as it were, and he, from a simple admonisher of his family, became the founder of a faith to which now above 130,000,000 are said to adhere. The articles KORAN and MOHAMMEDANISM contain some further details on his doctrine and its history. We have, in addition to the few observations on the points indicated at the beginning, only to reiterate that a man of Mohammed's extraordinary powers and gifts is not to be judged by a modern commonplace standard; and that the manners and morals of his own time and country must also be taken into consideration. We are far from overrating his character. He was at times deceitful, cunning, even revengeful and cowardly; and generally addicted beyond limit to sensuality. But all this does not justify the savage and silly abuse which has been heaped upon his name for centuries by ignorance and fanaticism. Not only his public station as prophet, preacher, and prince, but also his private character, his amiability, his faithfulness toward friends, his tenderness toward his family, and the frequent readiness to forgive an enemy, besides the extreme simplicity of his domestic life (he lived, when already in full power, in a miserable hut, mended his own clothes, and freed all his slaves), must be taken into consideration; and to do him full justice, his melancholic temperament, his nervousness, often bordering on frenzy, and which brought him to the brink of suicide, and his being a poet of the highest order, with all the weaknesses of a poet developed to excess, must not be forgotten. Altogether, his mind contained the strangest mixture of right and wrong, of truth and error. Although his self-chosen mission was the abolition of superstition, he yet believed in Jins, omens, charms, and dreams, and this is an additional reason against the, as we said, now generally abandoned notion that he was a vulgar designer, who by no means deceived himself about those revelations which he pretended to have received. And however much the religion of Islam may, rightly or wrongly, be considered the bane and prime cause of the rottenness of eastern states and nations in our day, it must, in the first place, not be forgotten that it is not necessarily Islam which has caused the corruption, as indeed its ethics are for the most part of the highest order; and in the second place, that Mohammed is not to be made responsible for all the errors of his successors. Take him all in all, the history of humanity has seen few more earnest, noble, and sincere "prophets"—using the word prophet in the broad human sense of one irresistibly impelled by an inner power to admonish, and to teach, and to utter austere and sublime truths, the full purport of which is often unknown to himself.

The most important European biographies of Mohammed are those of Sprenger, Weil, Muir, Nöldeke, Reinaud. See also KORAN, MOHAMMEDANISM, SUNNA.

MOHAMMED, the name of four sultans of Turkey, of whom the most noted is MOHAMMED II., surnamed *Bujuk* or THE GREAT, the conqueror of Constantinople. He was born at Adrianople in 1430, and succeeded his father Amurath II., in 1450. His first acts were the murder of his two brothers, and the suppression of a rebellion in Karaman. Having thus secured himself on the throne, he bent all his energies to the accomplishment of the great project which had always been kept prominently in view by his predecessors—the capture of Constantinople. This city was now the sole remnant of the once mighty empire of the Cæsars; and after more than a year spent in preparations, Mohammed commenced the siege April 6, 1453, with an army of 258,000 men, and a fleet of 320 vessels. The Greeks, aided by a gallant band of 2,000 strangers, under Gian

Justiniani, a noble Genoese, long maintained an obstinate resistance. On the morning of May 29, a combined attack was made by land and sea without success; but the retirement from the ramparts of Justiniani, who had been severely wounded, and despaired of a successful defense, caused a panic among his followers, and the simultaneous charge of a chosen body of janizaries, with Mahommed himself at their head, was irresistible. Constantine III. died in the breach, and the Turks poured in over his corpse to plunder and devastate his capital. Mohammed now transferred the seat of his government to Constantinople, and sought to win back the inhabitants by promising them the free exercise of their religion. He next reduced the kingdoms of Morea and Trebizond, offshoots of the Greek empire, obtained possession of Servia on the death of its last prince, and made formidable preparations for the invasion of Hungary. Belgrade was the first point of attack; and with 100,000 men, supported by a fleet of 200 ships on the Danube, Mohammed sat down before its walls. The enormous ordnance which had done such good service at Constantinople, were employed to batter the ramparts; but the valor, skill, and activity of the defenders foiled his utmost efforts. John Hunyady (q.v.), who, with 5,000 chosen troops, had re-enforced the garrison, destroyed or captured all his vessels, and soon after, by a sudden sally, defeated his army, and carried off the battering-train, compelling him to raise the siege, Aug. 6, 1456. His next enterprise was the invasion of Epirus, where Scanderberg had hitherto successfully defied the sultan's power. Three Turkish armies were destroyed in rapid succession, and a fourth and fifth under Mohammed himself met with no greater success; but the death of the gallant Epirote, in 1467, removed the only obstacle to the success of the sultan's plans, and Epirus was forthwith annexed to Turkey. The latter half of Mohammed's reign was also fruitful in important achievements, but our space will permit only a cursory notice of them. He reduced the khan of the Crimea to the condition of a vassal, deprived the Genoese of Caffa, and the Venetians of Friuli, Istria, Negropont, and Lemnos; but the knights of St. John repelled him from Rhodes, and the Venetians from Scodra. He carried his arms into Italy, and took Otranto, but died in 1481 at Nicomedia, while on the way to join his son Bajazet, who was warring with the Persians and Egyptians. His frequent contests with the former of these nations had always interfered very much with the successful prosecution of his designs of conquest in Europe. Mohammed was possessed of great abilities; he was brave, enterprising, and sagacious; nor was he deficient in learning, for he spoke four languages fluently, was well versed in geography, ancient history, and the natural sciences, and was practically acquainted with the fine arts. But the brilliancy of his career, and the occasional generosity and even magnanimity which he showed, cannot obliterate the recollection of those acts of cruelty and treachery which have justly branded him as the most ruthless tyrant of the house of Osman. As the founder of the Turkish power in Europe, his memory has always been revered by the Turks.

MOHAMMED AHMED : see Mahdi, El.

MOHAMMED HUSSEIN KHALIFA. Mudir of Dongola. See page 882.

MOHAMMED IV., 1642–92; b. Turkey; succeeded his father, Ibrahim I., in 1648. He possessed little capacity for power, and spent most of his time in the chase. He was fortunate in having as successive grand viziers two men of extraordinary talents—the Albanian Mohammed Kuprili or Kuperli, and his son, Ahmed Kuprili. Mohammed Kuprili promptly quelled the disturbances which prevailed throughout the empire at Ibrahim's death, and carried on the war with Venice which had been begun by Ibrahim. The Turkish fleet was defeated by the Venetians in the archipelago in 1651, and, five years later, another Turkish fleet was completely destroyed by them. In 1657 the Turks retook Lemnos and Tenedos. In 1660 war was declared with Austria; the Turkish army, after a successful campaign in Hungary, was at length badly defeated in 1664 by the combined forces of France, Italy, and Germany. In 1661 Ahmed Kuprili succeeded his father as vizier, and continued the war with Venice. He laid siege to the city of Candia in 1667, and forced it to surrender in 1669. A treaty of peace was negotiated between the two states at once. In 1672 Mohammed IV. put himself at the head of the army and invaded Poland, but was badly defeated the next year by John Sobieski, and in 1676 Poland was granted a treaty of peace. In 1682 Turkey declared war against Austria upon the occasion of a revolt in Hungary, and in 1683 Kara Mustapha, with an army of 300,000 men, laid siege to Vienna. The imperial army had fled from the city, which was on the point of capitulating, when it was relieved by an army under Charles of Lorraine and John Sobieski, who defeated the Turks, whose position grew every day more precarious. Another alliance was formed against them between Venice, Germany, Russia, and Poland. In 1687 Charles of Lorraine defeated the Turkish army, which suffered heavy losses, at Mohacs, and soon after Transylvania and other Danubian provinces fell away from Turkey. Late in 1687 a mutiny broke out in the Turkish army before Belgrade; the troops marched upon Constantinople, deprived Mohammed IV. of his throne, and made his brother sultan as Solyman III. Mohammed IV. was imprisoned during the rest of his life.

MOHAM'MEDANISM, the religion founded by Mohammed, or, according to him, the only orthodox creed existing from the beginning of the world, and preached by all the prophets ever since Adam. It is also called *Islâm*, resignation, entire submission to the will and precepts of God. In its exclusively dogmatical or theoretical part, it is *Imán*, faith; in its practical, *Dín*, religion (by way of eminence). The fundamental principles

of the former are contained in the two articles of belief: "There is no God but God; and Mohammed is God's apostle." The Mohammedan docrine of God's nature and attributes coincides with the Christian, in so far as he is by both taught to be the Creator of all things in heaven and earth, who rules and preserves all things, without beginning, omnipotent, omniscient, omnipresent, and full of mercy. Yet, according to the Mohammedan belief, he has no offspring: "He begetteth not, nor is he begotten." Nor is Jesus called anything but a prophet and apostle, although his birth is said to have been due to a miraculous divine operation; and as the Koran superseded the Gospel, so Mohammed, Christ. The crucifixion is said to have been executed upon another person, Christ having been taken up unto God before the decree was carried out. He will come again upon the earth, to establish everywhere the Moslem religion, and to be a sign of the coming of the day of judgment. Next to the belief in God, that in angels forms a prominent dogma. Created of fire, and endowed with a kind of uncorporeal body, they stand between God and man, adoring or waiting upon the former, or interceding for and guarding the latter. The four chief angels are "The Holy Spirit," or "Angel of Revelation"—Gabriel; the special protector and guardian of the Jews—Michael; the "Angel of Death"—Azraël (Raphael, in the apocryphal gospel of Barnabas); and Israfíl —Uriel, whose office it will be to sound the trumpet at the resurrection. It will hardly be necessary, after what we said under MOHAMMED, to point out, in every individual instance, how most of his "religious" notions were taken almost bodily from the Jewish legends; his angelology, however, the Jews had borrowed themselves from the Persians, only altering the names, and, in a few cases, the offices of the chief angelic dignitaries. Besides angels, there are good and evil genii, the chief of the latter being Iblis (despair), once called Azazil, who, refusing to pay homage to Adam, was rejected by God. These Jin are of a grosser fabric than angels, and subject to death. They, too, have different names and offices (Peri, fairies; Div, giants; Takvíns, fates, etc.), and are, in almost every respect, like the Shédim in the Talmud and Midrash. A further point of belief is that in certain God-given scriptures, revealed successively to the different prophets. Four only of the original 104 sacred books: viz., the Pentateuch, the Psalms, the Gospel, and the Koran, are said to have survived; the three former, however, in a mutilated and falsified condition. Besides these, a certain apocryphal gospel, attributed to St. Barnabas, and the writings of Daniel, together with those of a few other prophets, are taken notice of by the Moslems, but not as canonical books. The number of prophets, sent at various times, is stated variously at between 200,000 and 300,000, among whom 313 were apostles, and six were specially commissioned to proclaim new laws and dispensations, which abrogated the preceding ones. These were Adam, Noah, Abraham, Moses, Jesus, and Mohammed—the last the greatest of them all, and the propagator of the final dispensation. The belief in the resurrection and the final judgment is the next article of faith. The dead are received in their graves by an angel announcing the coming of the two examiners, Monker and Nakir, who put questions to the corpse respecting his belief in God and Mohammed, and who, in accordance with the answers, either torture or comfort him. This again is the Jewish "Chibbut hakkeber," the beating of the grave, a hyperbolical description of the sufferings during the intermediate state after death (purgatory). The soul, awaiting the general resurrection, enters according to its rank, either immediately into paradise (prophets), or partakes, in the shape of a green bird, of the delights of the abode of bliss (martyrs), or—in the case of common believers—is supposed either to stay near the grave, or to be with Adam in the lowest heaven, or to remain either in the well of Zem-Zem, or in the trumpet of the resurrection. According to others, it rests in the shape of a white bird under the throne of God. The souls of the infidels dwell in a certain well in the province of Hadramaut (Heb. Chambers of Death), or, being first offered to heaven, then offered to earth, and rejected by either, subject to unspeakable tortures until the day of resurrection. Concerning the latter, great discrepancy reigns among the Mohammedan theologians. Mohammed himself seems to have held that both soul and body will be raised, and the "Bone Luz" of the Jewish Haggadah was by him transformed into the bone Al Ajb, the rump-bone, which will remain uncorrupted till the last day, and from which the whole body will spring anew, after a forty days' rain. Among the signs by which the approach of the last day may be known—nearly all taken from the legendary part of the Talmud and Midrash, where the signs of the coming of the Messiah are enumerated—are the decay of faith among men, the advancing of the meanest persons to highest dignities, wars, seditions, and tumults, and consequent dire distress, so that a man, passing another's grave, shall say: "Would to God I were in his place!" Certain provinces shall revolt, and the buildings of Medina shall reach to Yahâb. Again: the sun will rise in the west, the Beast will appear, Constantinople will be taken by the descendants of Isaac, the Antichrist will come and be killed by Jesus at Lud. There will further take place, a war with the Jews, Gog and Magog's (Jajug and Majuj's) eruption, a great smoke, an eclipse, the Mohammedans will return to idolatry, a great treasure will be found in the Euphrates, the Kaaba will be destroyed by the Ethiopians, beasts and inanimate things will speak, and finally, a wind will sweep away the souls of those who have faith, even if equal only to a grain of mustard seed, so that the world shall be left in ignorance. The time of the resurrection even Mohammed could not learn from Gabriel: it is a mystery. Three blasts will announce it: that of conster-

nation, of such terrible powers that mothers shall neglect the babes on their breasts, and that heaven and earth will melt; that of examination, which will annihilate all things and beings, even the angel of death, save paradise and hell, and their inhabitants; and forty years later, that of resurrection, when all men, Mohammed first, shall have their souls breathed into their restored bodies, and will sleep in their sepulchers until the final doom has been passed upon them. The day of judgment, lasting from one to fifty thousand years, will call up angels, genii, men, and animals. The trial over, the righteous will enter paradise, to the right hand, and the wicked will pass to the left, into hell; both, however, have first to go over the bridge Al Sirât, laid over the midst of hell, and finer than a hair, and sharper than the edge of a sword, and beset with thorns on either side. The righteous will proceed on their path with ease and swiftness, but the wicked will fall down headlong to hell below—a place divided into seven stories or apartments, respectively assigned to Mohammedans, Jews, Christians, Sabians, Magians, idolaters, and—the lowest of all—to the hypocrites, who, outwardly professing a religion, in reality had none. The degrees of pain—chiefly consisting in intense heat and cold—vary; but the Mohammedans, and all those who professed the unity of God, will finally be released, while unbelievers and idolaters will be condemned to eternal punishment. Paradise is divided from hell by a partition (Orf), in which a certain number of half-saints will find place. The blessed, destined for the abodes of eternal delight (Jannat Aden, Heb. Gan Eden)—of which it is, however, not quite certain whether it is created already—will first drink of the pond of the prophet, which is supplied from the rivers of paradise, whiter than milk, and more odoriferous than musk. Arrived at one of the eight gates, they will be met by beautiful youths and angels; and their degree of righteousness (prophets, religious teachers, martyrs, believers) will procure for them the corresponding degree of happiness. It may, however, not be superfluous to add that, according to the Mohammedan doctrine, it is not a person's good works or merits which gain his admittance, but solely God's mercy; also, that the poor will enter paradise five hundred years before the rich; and that the majority of the inhabitants of hell are women. As to the various felicities which await the pious (and of which there are about a hundred degrees), they are a wild conglomeration of Jewish, Christian, Magian, and other fancies on the subject, to which the prophet's own exceedingly sensual imagination has added very considerably. Feasting in the most gorgeous and delicious variety, the most costly and brilliant garments, odors, and music of the most ravishing nature, and above all, the enjoyment of the Hûr Al Oyûn, the black-eyed daughters of paradise, created of pure musk, and free from all the bodily weaknesses of the female sex, are held out as a reward to the commonest inhabitants of paradise, who will always remain in the full vigor of their youth and manhood.* For those deserving a higher degree of recompense, rewards will be prepared, of a purely spiritual kind—i.e., the "beholding of God's face" (Shechinah) by night and by day. A separate abode of happiness will also be reserved for women, but there is considerable doubt as to the manner of their enjoyment. That they are not of a prominently spiritual nature is clear from the story of the prophet and the old woman. The latter solicited Mohammed to intercede with God that she might be admitted into paradise, whereupon he replied that old women were not allowed in paradise, which dictum—causing her to weep—he further explained by saying that they would first be made young again. The last of the precepts of pure faith taught by Mohammedanism, is the full and unconditional submission to God's decree [Islam], and the predestination of good and evil, which is found, from the beginning, inscribed on a "preserved table." Not only a man's fortunes, but his deeds, and, consequently, his future reward or punishment, are irrevocably, and thus unavoidably, pre-ordained (fate): a doctrine which is not, however, taken literally by *all* Moslems, but which has no doubt contributed largely to the success of Islam, by inspiring its champions with the greatest indifference and contempt for the dangers of warfare; their destiny being immutably fixed, under any circumstances.

Thus far, briefly, the Iman, dogmatical or theoretical part of Islam. The Din, or practical part, which contains the ritual and moral laws, inculcates as the chief duties the following four: prayer, alms-giving, fasting, and pilgrimage.

Prayer, "the key of paradise," comprises also certain religious purifications, as the most necessary preparations to the former. They are of two kinds: the *Ghusl*, or total immersion of the body, required as a religious ceremony, on some special occasions; and the *Wudû*, a partial ablution, to be performed immediately before the prayer. This is of primary importance, and consists of the washing of hands, face, ears, and feet up to the ankles—a proceeding generally accompanied at each stage by corresponding pious

---

* "The whole earth will be as one loaf of bread, which God will reach to them like a cake; for meat they will have the ox Balâm and the fish Nûn, the lobes of whose livers will suffice seventy thousand men. Every believer will have eighty thousand servants, and seventy-two girls of paradise, besides his own former wives, if he should wish for these, and a large tent of pearls, jacinths, and emeralds: three hundred dishes of gold shall be set before each guest at once, and the last morsel will be as grateful as the first. Wine will be permitted, and will flow copiously, without inebriating. The righteous will be clothed in the most precious silks and gold, and will be crowned with crowns of the most resplendent pearls and jewels. If they desire children, they shall beget them, and see them grow up within an hour. Besides the ravishing songs of the angel Israfil and the daughters of paradise, the very trees will, by the rustling of their boughs, the clanging of bells suspended from them, and the clashing of their fruits, which are pearls and emeralds, make sweetest music."

sentences, and concluded by the recital of the 97th chapter of the Koran. In the case of water being beyond reach, dry dust or sand may supply its place. "The practice of religion being founded on cleanliness," it is not sufficient that the believer himself should be purified, but even the ground or the carpet upon which he prays must be as clean as possible, and the use of a special prayer-carpet (Seggadéh) is therefore recommended. Every Mohammedan is obliged to pray five times in the space of every twenty-four hours. The prayer (Salah) itself consists partly of extracts from the revealed book, the Koran (Fard), partly of pieces ordained by the prophet without allegation of a divine order (Sunnah). The first time of prayer commences at the Maghrib, or about sunset; the second, at the Eshë, or nightfall; the third, at the Subh, or daybreak; the fourth, at the Duhr, or about noon; the fifth, at the Asr, or afternoon. The believers are not to commence their prayers exactly at sunrise, or noon, or sunset, lest they might be confounded with the infidel sun-worshipers. These several times of prayer are announced by the Muëddins (q.v.) from the minarets or madnehs of the mosques. Their chant, sung to a very simple but solemn melody, sounds harmoniously and sonorously down the height of the mosque, through the midday din and roar of the cities, but its impression is one of the most strikingly poetical in the stillness of night; so much so, that even many Europeans cannot help congratulating the prophet on his preferring the human voice to either the Jewish trumpet-call of the time of the Temple, or the Christian church-bells. The day-call (the Adan) consists chiefly of the confession of faith (God is most great—Mohammed is God's apostle—come to prayer, come to security) repeated several times; the night-calls (Ula, the first; Ebed, the second), destined for persons who desire to perform supererogatory acts of devotion, are much longer. The believer often changes his posture during his prayers; and a certain number of such inclinations of head and knees, prostrations, etc., is called a Rekah. It is also necessary that the face of the worshiper should be turned toward the Kibleh, in the direction of Mecca (q.v.), the exterior wall of the mosque marking that direction being distinguished by a niche (Mehrab). All sumptuous and pompous apparel is laid aside before the believer approaches the sacred place; and the extreme solemnity and decorum, the unaffected humility, the real and all-absorbing devotion which pervades it, have been unanimously held up as an example to other creeds. Women, although not strictly forbidden to enter the mosque, yet are not practically allowed to pray there, lest their presence might be hurtful to true devotion. Besides these prayers, there are others ordained for special occasions, as on a pilgrimage, before a battle, at funerals, during an eclipse, etc. That the Moslems do not pray *to* Mohammed, but simply implore his intercession, as they do that of the numerous saints, the relatives of the prophet, and the first propagators of Islam, need, after what we said under MOHAMMED, not be dwelt upon here. For the particulars of the service in the mosque, the reader is referred to that heading. It may be remarked in passing, that Mohammedanism has no clergy in our sense of the word, the civil and religious law being bound up in one. See also MOLLAH, MUFTI.

Next in importance stands the duty of giving alms. These are twofold—legal (Zekah) and voluntary (Sadakah; Heb. Zedakah, piety, righteousness); but the former, once collected by the sovereign, and applied to pious uses, has now been practically abrogated. The Sadakah is, according to the law, to be given once every year, of cattle, money, corn, fruits, and wares sold, at about the rate of from two and a half up to twenty per cent. Besides these, it is usual to bestow a measure of provisions upon the poor, at the end of the sacred month of Ramadán.

The duty of fasting follows. [FASTS.] During the whole month of Ramadán, the Moslem is commanded to refrain from eating, drinking, smoking, smelling perfumes, bathing, and every unnecessary indulgence in worldly pleasure, from daybreak until sunset. From that period till the morning, he is allowed to eat, drink, and enjoy himself. The Arabian years being lunar, it often happens that the Ramadán falls in midsummer, when the fasting, more especially the abstaining from drinking, is excessively mortifying. None are exempt from this duty save the sick, travelers, and soldiers in time of war; but they are bound to fast an equal number of days during some other months. Nurses and pregnant women are entirely free from fasting. It is Mohammed's special and express desire that no one should fast who is not quite equal to it, lest he might injure his health, and disqualify himself for necessary labor. Of the other commendable fast-days, the Ashura, on the 10th of Moharram (the Jewish Jom Kippur), deserves special mention. There are very few Moslems who do not keep the Ramadán, even if they neglect their other religious duties; at all events, they all pretend to keep it most strictly, fasting being considered "one-fourth part of the faith," nay, "the gate of religion."

Of the fourth paramount duty of the Mohammedan—viz., the pilgrimage to Mecca—we have spoken both under that heading, and, more fully, in the article HAJJ. Suffice it here briefly to recapitulate that the Kaaba (q.v.) is to be encompassed seven times, the celebrated black stone being kissed at each round, that Mount Arafat is to be visited, the sacrifice El-Fida (the Ransom, in memory of Ismael's sacrifice) to be performed, and a number of minor ceremonies to be gone through by the pilgrim, and that he who neglects to perform the sacred pilgrimage, "might as well die a Jew or a Christian."

To the "positive" ordinances of Islam may also be reckoned the "Saghir," or minor, and "Kebir," or great festivals. [FESTIVALS.] The first (Al-Fetr, or breaking the

fast), following immediately upon the Ramadán, begins on the first day of the month of Shawál, and lasts three days, The second (Eed Al-Kurban, or sacrifice) begins on the 10th of Dsu'l Heggeh, when the pilgrims perform their sacrifice, and lasts three or four days. Yet, although intended to be the more important of the two, the people have in most places changed the order, and, by way of compensation for the previous fast, they make the lesser festival which follows the Ramadán the more joyful and the longer of the two. The day set aside for the weekly day of rest is the Friday—not, as is generally supposed, because both the Jewish Sabbath and the Christian Sunday were to be avoided, but because, from times long before Mohammed, the people used to hold public assemblies for civil as well as religious purposes on that day. The celebration of the Moslem days of religious solemnity is far less strict than is the custom with the other Shemitic religions. Service being over, the people are allowed to return to their worldly affairs, if they cannot afford to give themselves up entirely to pleasure or devotion for the rest of the sacred period.

Thus far, briefly, the principal positive laws of Islam relating to faith and practice. We shall now touch upon the fundamental prohibitory laws contained in the Koran.

First of all, the drinking of wine, which includes all strong and inebriating liquors, as giving rise to "more evil than good," is rigorously forbidden; and although of late, chiefly through European influence, very many Moslems have lost their religious scruples on that score. and not only secretly but openly indulge in spirits, yet the great bulk of the faithful refuse even to make use of the proceeds of the sale of wine or grapes. Some over-scrupulous believers even include opium, coffee, and tobacco in the prohibition; but general practice has decided differently. The prohibitory laws respecting food resemble closely those of Judaism: blood, the flesh of swine, further, animals which have died from disease or age, or on which the name of some idol has been invoked, or which have been sacrificed unto an idol, or which have been strangled, or killed by a blow, a fall, or by some other beast, are strictly forbidden. "Pure" animals must be slaughtered according to certain fixed rules, and the name of God is to be invoked before the operation, without, however, the usual addition of the benevolent epithets, since these would ill befit the sufferings of a fellow-creature. Fish, birds, game are mostly allowed for food, yet there are in nearly all cases certain religious ceremonies to be observed, before they become fit for the believer's table.

All games subject to chance ("casting lots by arrows")—such as dice, cards, tables, bets, etc.—are considered so wicked, that a gambler's testimony is invalid in a court of law. (The Talmud only rejects the testimony of the habituul "*dice-* [Kubia, i.e., Cube] *gambler* and *better upon doves.*") Chess and other games depending on skill—provided they do not interfere with the regular performance of religious duties, and that they are played without any stakes whatsoever—are allowed by the majority of Moslem theologians. Usury is strictly prohibited. Taking interest upon any loan, however large or small, or profiting in trade through any questionable means, save by buying and selling, is severely condemned.

To prevent the faithful from ever falling back into idolatry, the laws relating to images and pictures have been made very stringent. Whosoever makes an imitation of any living being in stone, wood, or any other material, shall, on the day of judgment, be asked to endow his creation with life and soul, and, on his protesting his inability of doing so, shall undergo the punishment of hell for a certain period.

The civil and criminal laws of Mohammedanism, founded both on the Koran and the Traditions (*Sunna*), are, in some instances, where the letter of the written or oral precept allows of various explanations, or where the case in question is not foreseen, interpreted according to the opinion of one of the four great masters of Islam: Abu Hanífa, Malec Ibn Ans, Sháfeï, Ibn Hanbal, within the pale of their respective sects. The principal points, however, upon which all Mohammedans agree are the following: Polygamy is allowed, not, as is commonly supposed, without any restriction, but: "Take in marriage of the women who please you, two, three, or four; but if ye fear that ye cannot act equitably, one; or those whom your right hands have acquired"—i.e., your slaves. These are the explicit words of the Koran (iv. 3), so that four wives, and a certain number of concubine slaves, is the whole extent to which a Moslem may legally go. The prophet's example proves nothing to the contrary, since he was endowed with special privileges, and not subject to the common law in many respects. It is, moreover, added, as an advice, that to marry one or two is quite sufficient for a man, if he apprehend any inconvenience from a larger number of wives. A Moslem may, if urged by excessive love, or if unable to obtain a wife of his own creed, marry a Christian woman or a Jewess, but a Mohammedan woman is not, under any circumstances, to marry an unbeliever. In all cases, however, the child born of a Moslem, whatever the mother's faith, is a Moslem; nor does the wife, who is an unbeliever, inherit at her husband's death. Forbidden degrees are: the mother, daughter, sister, half-sister, aunt, niece, foster-mother, or a woman related to the faithful "by milk in any of the degrees which would preclude his marriage with her, if she were similarly related to him by consanguinity;" the mother of his wife, even if he be not properly married to the latter yet; the daughter of his wife, if the latter still be his legal wife; his father's wife and his son's wife; or two sisters at the same time; or wives who stand to each other in the relation of aunt and niece; or the unemancipated slave, or another man's slave, if he have already a free wife. A simple declaration of a man and

woman at the age of puberty, before two witnesses, of their intention to marry each other, and the payment of part of the dowry (which is indispensable, and must amount to at least ten dirhems, or about five shillings), is sufficient for a legal marriage. A girl under age is given away by her natural or appointed guardian, with or without her consent. To see the face of any woman who is neither his wife nor his concubine, nor belongs to any of the forbidden degrees, is strictly forbidden to the believer.

Divorce is a comparatively light matter with the Mohammedans. Twice, a man may send away his wife and take her back again without any ceremony; the third time, however—if he unite the triple divorce in one sentence at once—he dare not receive her again in wedlock until she have been married properly to another man in the meantime. Mere dislike is sufficient reason for a man to dissolve the conjugal ties, and his saying: "Thou art divorced," or "I divorce thee," together with the payment of part of the wife's dowry, is all that is required from him by the law. A wife, on the other hand, is bound to her husband forever, unless she can prove some flagrant ill-usage or neglect of conjugal duty on his part; and even then, she forfeits part, or the whole, of her dowry. A divorced woman is obliged to wait, like a widow, for a certain period before marrying again: if pregnant, until delivery; three months, or four months and ten days, according to circumstances. If she have a young child, she is to suckle it until it be two years old, and the father is to bear all the expenses of the maintenance of mother and child. A woman proving disobedient to her husband, may be declared by the kadi "náshizeh," i.e. rebellious, and the husband is no longer bound to maintain her. Yet, he cannot be forced to divorce her under these circumstances, so that the woman is generally in so sore a plight that she is obliged to promise good behavior for the future, and the husband has then either to take her back to his house, or to set her free by a formal divorce. On the other hand, it often happens that a woman prefers a mere separation, to continuing to live with her husband; in which case she gets herself, of her own accord, inscribed a "náshizeh." If a slave becomes a mother by her master, and he acknowledges the child to be his own, the latter is free, and the mother is to be emancipated at the master's death, and may not be given away, or otherwise disposed of by him, during his lifetime. A free person, wishing to marry his or her slave, must first emancipate this slave; and if the slave of another person has been married by a free man or woman, and afterward becomes the latter's property, the marriage becomes illegal, and can only be renewed by a legal contract and emancipation.

The privilege of primogeniture does not exist in the Mohammedan law, but males generally receive a double share. A person may not bequeath more than one-third of his property, unless there be no legal heirs. Children, whether begotten with the legal wife, or slave, or concubine, or only adopted, and their descendants, are the first heirs; next come the claims of wives, parents, brothers, sisters, in their order. Where there is no legal heir, the property falls to the crown.

The law is very lenient toward debtors, the Koran recommending the creditor to remit a debt "as alms." Insolvency and inability to work for the discharge of the claim, solve all further obligations. The most conscientious performance of all private contracts, however, is constantly recommended in the Koran.

Murder is either punished with death, or by the payment of a fine to the family of the deceased, according to their own pleasure. There must, however, be palliating circumstances in the latter case. The Bedouins, however, have expanded the law of blood-revenge in a terrible manner, and up to this day the "vendetta" often rages not only between family and family, but between whole tribes, villages, and provinces. Unintentional homicide is expiated by freeing a believer from slavery, and paying to the family a certain sum in proportion to the rank and sex of the deceased. He who has not the means of freeing a believer, is to fast for two months by way of penance. According to the strict letter of the law, a man is not liable to capital punishment for killing his own child or an infidel; but, practically, no difference is generally made by the Mohammedan governments (chiefly the Turkish) in our day. Murder is punished with death, and no fine frees the culprit.

The Mosaic law of retaliation, in case of *intentional* wounds and mutilation, holds good also for Islam; that is (not, as has ignorantly been supposed, that the corresponding limb of the offender is to be cut off), a certain proportionate fine in money is to be paid to the injured. The payment for any of the single limbs of the human body—e.g. the nose—is the full price of blood, as for a homicide; for a limb which is found twice, like hand or foot, half; for a finger or toe, the tenth part, etc. Women and slaves have smaller claims. Injuries of a dangerous, or otherwise grievous nature, pay the full price; those of an inferior kind, however, bring the perpetrator within the province of the lash or cudgel, which is supposed to have "come down from heaven, to be used by the judge for the promotion of virtue and duty."

The Koran orders theft—of no less than the value of half a crown—to be punished by cutting off the chief offending limb: the right hand; the second theft is punishable by the loss of the left foot; the third, of the left hand; the fourth, of the right foot, etc.; but the ordinary punishments of imprisonment, hard labor, and the bastinado, have been substituted in our days. The property stolen must not, however, have been of easy access to the thief, nor must it have consisted of food, since he may have taken this to satisfy the craving of his hunger.

Unchastity on the part of a woman was, in the commencement of Islam, punished by imprisonment for life, for which afterward, however, stoning was substituted in the case of a married woman; and a hundred stripes and a year's exile in the case of an unmarried free woman; a slave to undergo only half of that punishment. Yet, it is necessary that he who accuses a "woman of reputation" of adultery or fornication, shall produce four (male) witnesses, and if he be not able to do so, he is to receive fourscore stripes, nor is his testimony ever after to be received, for he is considered an "infamous prevaricator"—unless he swear four times that he speaks the truth, and the fifth time imprecate God's vengeance if he speak false. Yet, even this testimony may be overthrown by the wife's swearing four times that he is a liar, and imprecating the fifth time the wrath of God upon herself, if he speak the truth. In the latter case, she is free from punishment; the marriage, however, is to be dissolved. Fornication in either sex is, by the law of the Koran, to be visited with a hundred stripes,

Infidelity, or apostacy from Islam, is a crime to be visited by the death of the offender, if he have been warned thrice without recanting. Severer still, that is, not to be averted by repentance or revocation of any kind, is the punishment inflicted for blasphemy—against God, Mohammed, Christ, Moses, or any other prophet. Instantaneous death is the doom of the offender; for if apostacy may be caused by error and misguidance, "blasphemy is the sign of complete wickedness and thorough corruption of the soul."

A further injunction of the Koran, for the carrying out of which, however, the time has well-nigh gone by, is that of making war against the infidels. He who is slain while fighting in defense and for the propagation of Islam, is reckoned a martyr; while a deserter from the holy war is held up as an object of execration, and has forfeited his life in this world as well as in the world to come. At first, all the enemies taken in battle were ruthlessly slain; later, however, it became the law to give the people of a different faith against whom war was declared the choice of three things: either to embrace Islam—in which case they became Moslems at once, free in their persons and fortunes, and entitled to all the privileges of Moslems; or to submit to pay tribute—in which case they were allowed to continue in their religion, if it did not imply gross idolatry or otherwise offended against the moral law; or to decide the quarrel by the fortune of war—in which case the captive women and children were made slaves, and the men either slain, unless they became converts at the last moment, or otherwise disposed of by the prince. The fifth part of the spoil belongs "to God," that is, the sanctuary (Kaaba, etc.), to the apostle and his kindred, to the orphans, the poor, and the traveler.

We need hardly urge that the Koran is not a systematically arranged code, and that all the laws and regulations hitherto enumerated, although contained in it, either bodily or, as it were, in germs—further developed by the Sunna (q.v.)—are to a great extent only mentioned in an incidental manner, thrown together and mixed up, often in the strangest manner, with the most heterogeneous dicta, dogmas, moral exhortations, civil and criminal laws, etc., and are principally to be considered as supplementary to the existing laws and regulations which they either abrogated, confirmed, or extended, according to the pressing demand of circumstances during the prophet's life. In cases for which subsequent ages found no written rules laid down by the prophet, traditional oral dicta were taken as the norm, and later still, precedents of the caliphs were binding. Hence contradictions in theory and practice have crept in, according to the different traditions and decisions of the imams or expounders of the law, besides the various interpretations put upon the book itself within the pale of the different Mohammedan sects. The secular tribunals, therefore, not unfrequently differ in their decisions from the judicial tribunals; and the distinction between the written civil law of the ecclesiastical courts and the common law, aided by the executive power, is, fortunately for the cause of human culture and the spread of civilization, getting clearer and clearer every day.

That part of Islam, however, which has undergone (because not to be circumscribed and defined by doctors) the least changes in the course of time, and which most distinctly reveals the mind of its author, is also its most complete and its most shining part—we mean the ethics of the Koran. They are not found, any more than the other laws, brought together in one, or two, or three Surahs, but "like golden threads" they are woven into the huge fabric of the religious constitution of Mohammed. Injustice, falsehood, pride, revengefulness, calumny, mockery, avarice, prodigality, debauchery, mistrust, and suspicion are inveighed against as ungodly and wicked; while benevolence, liberality, modesty, forbearance, patience and endurance, frugality, sincerity, straightforwardness, decency, love of peace and truth, and above all, trusting in God and submitting to his will, are considered as the pillars of true piety, and the principal signs of a true believer. Nor must we omit to point out expressly that Mohammed never laid down that doctrine of absolute predestination and "fatality" which destroys all human will and freedom, since the individual's deeds cannot alter one iota in his destiny either in this world or in the next. So far from it, foolhardiness is distinctly prohibited in the Koran (ii. 196). Caution is recommended. Prayer, the highest ceremonial law of Islam, is modified in case of danger. It is legal to earn one's livelihood on Friday after prayer, and to shorten the readings in the Koran for the sake of attending to business. All of which is enough to show that the Moslem is not to expect to be fed pursuant to a

divine decree whether he be idle or not. On the other hand, a glance at the whole system of faith, built on hope and fear, rewards and punishments, paradise and hell, both to be man's portion according to his acts in this life, and the incessant exhortations to virtue, and denunciations of vice, are sufficient to prove that aboriginal predestination, such as St. Augustine taught it, is not in the Koran, where only submission to the Lord's will, hope during misfortune, modesty in prosperity, and entire confidence in the divine plans, are supported by the argument, that everything is in the hands of the highest being, and that there is no appeal against his absolute decrees.

And this is one instance of the way in which most of Mohammed's dicta have been developed and explained—both by sectarians and enemies within and without Islam—in such a manner that he has often been made to teach the very reverse of what he really did teach; and thus monstrosities now found in his creed, if carefully traced back to their original sources, will, in most cases, be seen to be the growth of later generations, or the very things he abrogated. That, again, the worst side of his character, the often wanton cruelty with which he pursued his great mission, the propagation of his faith, should by his successors have been taken as a thing to be principally imitated, is not to be wondered at, considering how brilliant the results of the policy of the bloody sword had proved. Scarcely a century had elapsed after Mohammed's death, and Islam reigned supreme over Arabia, Syria, Persia, Egypt, the whole of the northern coast of Africa, even as far as Spain; and notwithstanding the subsequent strifes and divisions in the interior of this gigantic realm, it grew and grew outwardly, until the crescent was made to gleam from the spires of St. Sophia at Constantinople, and the war-cry "Allah il Allah!" resounded before the gates of Vienna. From that time, however, the splendor and the power of Mohammedanism began to wane. Although there are counted about 130 millions this day all over the globe who profess Islam, and although it is, especially at this present juncture, making great progress among the African races, yet the number of real and thorough believers is infinitely small; and since it has left off conquering, it has lost also that energy and elasticity which promises great things. Its future fate will depend chiefly, we should say, on the progress of European conquest in the east, and the amount of western civilization which it will, for good or evil, import into those parts.

We cannot consider in this place what Islam has done for the cause of all humanity, or, more exactly, what was its precise share in the development of science and art in Europe. We refer to the special articles which treat of these subjects, and particularly to the biographies found in the course of this work of men eminent in every branch of human knowledge who have issued from the ranks of Islam. Broadly speaking, the Mohammedans may be said to have been the enlightened teachers of barbarous Europe from the 9th to the 13th century. It is from the glorious days of the Abbaside rulers that the real renaissance of Greek spirit and Greek culture is to be dated. Classical literature would have been irredeemably lost, had it not been for the home it found in the schools of the "unbelievers" of the "dark ages." Arabic philosophy, medicine, natural history, geography, history, grammar, rhetoric, and the "golden art of poetry," schooled by the old Hellenic masters, brought forth an abundant harvest of works, many of which will live and teach as long as there will be generations to be taught.

Besides the Koran, the Sunna, and the native (Arabic, Persian, Turkish, etc.) writers on the foregoing subject, we mention as further references the works of the European scholars Maracci, Hyde, Prideaux, Chardin, Du Ryer, Reland, D'Herbelot, Sale, De Sacy, Hammer, Burckhardt, Sprenger, Burton, Muir, Garcin de Tassy, Lane, Weil, Geiger, Nöldeke. See KORAN, MOHAMMED, SHIITES, SHAFIITES, SUNNA, MOHAMMEDAN SECTS.

MOHAMMEDAN SECTS. "My community," Mohammed is reported to have said, "will separate itself into 73 sects; one only will be saved, all the others shall perish." This prophecy has been largely fulfilled. Even during the illness, and immediately after the death of the founder, many differences of opinion arose among his earliest adherents. We have endeavored to show, both under KORAN and MOHAMMEDANISM, how the fundamental book of Islam left certain points undecided by the very fact of its poetical wording, and how, further, the peculiarity of the Arabic idiom at times allowed many interpretations to be put upon one cardinal and dogmatic sentence. To add to this uncertainty, a vast number of oral traditions sprang up and circulated as an expansive corollary to the Koran. Political causes soon came to assist the confusion and contest, and religion was made the pretext for faction-fights, which in reality had their origin in the ambition of certain men of influence. Thus "sects" increased in far larger numbers even than the prophet had foretold, and though their existence was but short-lived in most instances, they yet deserve attention, were it only as signs and tokens of the ever-fresh life of the human spirit, which, though fettered a thousand times by narrow and hard formulas, will break these fetters as often, and prove its everlasting right to freedom of thought and action.

The bewildering mass of these currents of controversy has by the Arabic historians been brought under four chief heads or fundamental bases. The first of these relates to the divine attributes and unity. Which of these attributes are essential or eternal? Is the omnipotence of God absolute? If not, what are its limits? Further, as to the doctrine

of God's predestination and man's liberty—a question of no small purport, and one which has been controverted in nearly all "revealed" religions—How far is God's decree influenced by man's own will? How far can God countenance evil? and questions of a similar kind belonging to this province. The third is perhaps the most comprehensive "basis," and the one that bears most directly upon practical doctrines—viz., the promises and threats, and the names of God, together with various other questions chiefly relating to faith, repentance, infidelity, and error. The fourth is the one that concerns itself with the influence of reason and history upon the transcendental realm of faith. To this chapter belong the mission of prophets, the office of Imam, or head of the church, and such intricate subtleties as to what constitutes goodness and badness; how far actions are to be condemned on the ground of reason or the "law," etc.

One broad line, however, came to be drawn, in the course of time, among these innumerable religious divisions, a line that separated them all into orthodox sects and heterodox sects; orthodox being those only who adopted the oral traditions or Sunna (see SUNNITES).

Much more numerous than the orthodox divisions are the heterodox ones. Immediately after Mohammed's death, and during the early conquests, the contest was chiefly confined to the question of the Imamat. But no sooner were the first days of warfare over, than thinking minds began to direct themselves to a closer examination of the faith itself, for which and through which the world was to be conquered, and to the book which preached it, the Koran. The earliest germs of a religious dissension are found in the revolt of the Kharajites against Ali, in the 37th year of the Hegira; and several doctors shortly afterwards broached heterodox opinions about predestination and the good and evil to be ascribed to God. These new doctrines were boldly, and in a very advanced form, openly preached by Wâsil Ibn Atâ, who, for uttering a moderate opinion in the matter of the "sinner," had been expelled from the rigorous school of Basra. He then formed a school of his own—that of the Separatists or Motazilites (q.v.), who, together with a number of other "heretical" groups, are variously counted as one, four, or seven sects.

We now come to the second great heretic group, the Sefatians. The Sefatians (attributionists) held a precisely contrary view to that of the Motazilites. With them, God's attributes, whether essential or operative, or what they afterwards called declarative or historical, i.e., used in historical narration (eyes, face, hand), anthropomorphisms, in fact, were considered eternal. But here, again, lay the germs for more dissensions and more sects in their own midst. Some taking this notion of God's attributes in a strictly literal sense, assumed a likeness between God and created things; others giving it a more allegorical interpretation, without, however, entering into any particulars beyond the reiterated doctrine, that God had no companion or similitude. The different sects into which they split were, first, the Asharians, so called from Abul Hasan al Ashari, who, at first a Motazilite, disagreed with his masters on the point of God's being bound to do always that which is best. He became the founder of a new school, which held (1) that God's attributes are to be held distinct from his essence, and that any literal understanding of the words that stand for God's limbs in the Koran is reprehensible. (2) That predestination must be taken in its most literal meaning, i.e., that God preordains everything. The opinions on this point of man's free will are, however, much divided, as indeed to combine a predestination which ordains every act with man's free choice is not easy; and the older authors hold it is well not to inquire too minutely into these things, lest all precepts, both positive and negative, be argued away. The middle path, adopted by the greater number of the doctors, is expressed in this formula: There is neither compulsion nor free liberty, but the way lies between the two; the power and will being both created by God, though the merit or guilt be imputed to man. Regarding mortal sin, it was held by this sect that if a believer die guilty of it without repentance, he will not, for all that, always remain a denizen of hell. God will either pardon him, or the prophet will intercede on his behalf, as he says in the Koran: "My intercession shall be employed for those among my people who shall have been guilty of grievous crimes;" and further, that he in whose heart there is faith but of the weight of an ant, shall be delivered from hell-fire. From this more philosophical opinion, however, departed a number of other Sefatian sects, who, taking the Koranic words more literally, transformed God's attributes into grossly corporeal things, like the Mosshabehites, or Assimilators, who conceived God to be a figure composed of limbs like those of created beings, either of a bodily or spiritual nature, capable of local motion, ascent, or descent, etc. The notions of some actually went so far as to declare God to be "hollow from the crown of the head to the breast, and solid from the breast downward; he also had black curled hair." Another subdivision of this sect were the Jabarians, who deny to man all free agency, and make all his deeds dependent on God. Their name indicates their religious tendency sufficiently, meaning "Necessitarians."

The third principal division of "heretical sects" is formed by the Kharejites, or "rebels" from the lawful prince—i.e., Ali—the first of whom were the 12,000 men who fell away from him after having fought under him at the battle of Seffein, taking offense at his submitting the decision of his right to the caliphate (against Moawiyah) to arbitration. Their "heresy" consisted, first, in their holding that any man might be called to the Imamat though he did not belong to the Koreish, nor was even a freeman, provided

he was a just and pious man, and fit in every other respect. It also followed that an unrighteous Imam might be deposed, or even put to death; and further, that there was no absolute necessity for any Imam in the world.

Of the fourth principal seet, the Shiites, or "Sectaries," the followers of Ali Ibn Abi Tâleb, we have spoken under that speeial heading.

It remains only to mention a few of the many pseudo-prophets who arose from time to time in the bosom of Islam, drawing a certain number of adherents around them, and threatening to undermine the ehurch founded by Mohammed, by either deelaring themselves his legal suecessors, or completely renouncing his doetrines. The first, and most prominent among these, was Mosaylima (q.v.). Next to him stands Al-Aswad, originally called Aihala, of the tribe of Ans, of whieh, as well as of that of a number of other tribes, he was governor. He pretended to receive certain revelations from two angels, Sohaik and Shoraik. Certain feats of legerdemain, and a natural eloquenee, proeured him a number of followers, by whose aid he made himself master of several provinces. A counter-revolution, however, broke out the night before Mohammed's death, and Al-Aswad's head was cut off; whereby an end was put to a rebellion of exactly four months' duration, but already assuming large proportions. In the same year (11 Hegira), but after Mohammed's death, a man named Toleiha set up as prophet, but with very little success. He, his tribe and followers, were met in open battle by Khalid, at the head of the troops of the faithful, and being beaten, had all finally to submit to Islam.

A few words ought also to be said regarding the "veiled prophet," Al-Mokanna, or Borkai, whose real name was Hakem Ibn Hashem, at the time of Al-Mohdi, the third Abbaside ealiph. He used to hide the deformity of his face (he had also but one eye) by a gilded mask, a eireumstanee whieh his followers explained by the splendor of his countenance being too brilliant (like that of Moses) to be borne by ordinary mortals. Being a profieient in jugglery besides, whieh went for the power of working miraeles, he soon drew many disciples and followers around him. At last he arrogated the office of the Deity itself, whieh, by eontinual transmigrations from Adam downward, had at last resided in the body of Abu Moslem, the governor of Khorassan, whose secretary this new prophet had been. The caliph, finding him growing more and more formidable every day, sent a force against him, whieh finally drove him baek into one of his strongest fortresses, where he first poisoned and then burned all his family; after whieh he threw himself into the flames, whieh eonsumed him completely, except his hair. He had left a message, however, to the effect that he would reappear in the shape of a gray man riding on a gray beast, and many of his followers for many years after expeeted his reappearance. They wore, as a distinguishing mark, nothing but white garments. He died about the middle of the 2d e. Hegira.

Of the Karmathians and the Ismaïlis, we have spoken under these special headings. We ean searcely enumerate among the prophets Abul Teyeb Ahmed Al-Motanebbi, one of the most celebrated Arabie poets, who mistook, or pretended to mistake, his poetieal inspirations for the divine afflatus, and eaused several tribes to style him prophet, as his surname indieates, and to aeknowledge his mission. The governor of his province, Lûlû, took the promptest steps to stifle any such pretensions in the bud, by imprisoning him, and making him formally renounee all absurd pretensions to a prophetical office. The poet did so with all speed. He was richly rewarded by the eourt and many prinees for his minstrelsy, to whieh heneeforth he elung exelusively; but the riches he thus accumulated became the cause of his death. Robbers attaeked him while he was returning to his home in Kufa, there to live upon the treasure bestowed upon him by Ada-do'ddawla, sultan of Persia.—The last of these new prophets to be mentioned is Baba, who appeared in Amasia, in Natolia, in 638 Hegira, and who had immense suceess. chiefly with the Turkmâns, his own nation, so that at last he found himself at the head of nearly a million men, horse and foot. Their war-cry was, God is God, and Baba—not Mohammed—is his prophet. It was not until both Christians and Mohammedans combined for the purpose of self-defense, that this new and most formidable power was annihilated, its armies being routed and put to the sword, while the two chiefs were deeapitated by the executioner.

MOHA'VE, a co. in n.w. Arizona, having the navigable Rio Colorado for its w. boundary, separating it from California, and the Bill Williams river and Santa Maria creek for its s. boundary; about 6,500 sq.m.; pop. '80, 1,190. Its surface is mountainous, largely covered with timber, and with broad valleys varying from 2 to 10 m. in width. Its soil is for the most part unproduetive, but the river banks are susceptible of cultivation, bearing now a wild growth of eottonwood, mezquite, and the nutritious grass that furnishes good pasturage. It contains the eelebrated cañon of the Colorado, a stupendous ehasm with rocky walls from 3,000 to 6,000 ft. high extending for 300 miles. Gold, copper, and lead are found; and it has rich silver mines and quartz mills. Its trade is principally in miners' supplies. Capital, Mineral Park.

MOHA'VE DESERT, a valley in s. California lying principally in s. Bernadino county. It is a desert only in name, as large parts of it afford good pasturage, and water is easily procurable in wells, though the streams in the valley are small, and do

not flow into the ocean. In some portions the summer heat is intense, and vegetation is scanty. Much of the district is said to be below the level of the sea. Mohave river, in s. Bernardino co., California, flows e.n.e., and is lost in the Mohave desert.

MOHA'VES, the name of a tribe of Indians who occupy lands along the Colorado and Mohave rivers, in Arizona. They belong to a nation of the Pima family—the Yumas—and are naturally a brave and warlike race, though not quarrelsome. They favor agriculture as a pursuit more than most of the tribes, and some of them are semi-civilized in their manner of living, occupying decently constructed dwellings. About 800 of them dwell on a reservation appointed by the U. S. government, comprising about 130,000 acres. The remainder, twice or three times as many, are scattered. They are rapidly diminishing in numbers through the influence of disease. No attempt is being made to educate them, nor are there any missions among them.

MO'HAWK, a river of New York, named from a tribe of Indians. It rises in Oneida county, 20 m. n. of Rome, and runs e.s.e. into the Hudson at Waterford, 10 m. above Albany. It is 135 m. long, and has numerous and picturesque waterfalls, especially at Little Falls, Cohoes, and Waterford, affording abundant water-power. In its populous valley are the Erie canal and New York Central railway.

MOHAWKS. See AGMEGUE.

MOHICANS, MOHEGANS, or MAHICANNI, once a powerful and warlike sub-tribe of North American Indians, of the great Algonquin family, which, in the 17th c., inhabited the territory n.n.w. of Long Island sound, and e. of the river Hudson, now included in the states of New York, Connecticut, and Massachusetts. Being compelled to give way to the conquering Iroquois confederacy, they retired to the valley of the Housatonic river in Connecticut, and were consequently one of the first tribes who came into collision with, and were dispossessed of their territory by the early British settlers. They subsequently lived dispersed among the other tribes, and all traces of them have now nearly disappeared. Their name has become widely known through Mr. J. Fenimore Cooper's celebrated novel, *The Last of the Mohicans.*

MOHI'LEV, or MOGILEV, a government of European Russia, lying between Minsk and Smolensk, contains 18,500 English sq.m., with a pop. (1880) of 1,092,500. The inhabitants are mostly Rusniaks, though there are also many Russians, Germans, Jews, and even Bohemians. The country is generally a plain, with here and there an occasional undulation; the soil is very fertile, and the climate most agreeably mild. Agriculture has here reached a high degree of perfection, and the same may be said of arboriculture and horticulture. The natural pasturage is of fine quality, and affords abundant nourishment to immense herds of cattle. The forests are extensive. The country is watered by the Dnieper and its numerous affluents, which form the means of communication with the Black sea ports, and of the transit of corn, timber, and masts, of which last large quantities are annually floated down to Kherson. Bog iron-ore is found in abundance. The inhabitants are celebrated for their activity and industry; and Mohilev, from its great natural advantages, has now become one of the richest provinces of Russia.

In early times, Mohilev belonged to the territory of the Russian prince of Smolensk, but was subsequently conquered by the grand duke of Lithuania, and was, along with Lithuania, united to the kingdom of Poland. In 1772 it was seized by Russia at the first partition of Poland; and in 1796 was joined to the government of Vitebsk, under the name of *White Russia;* but since 1802 it has formed a separate government.

MOHILEV, or MOGILEV, the capital of the government of the same name in European Russia, and one of the finest towns of Russia, is situated in the center of the government, on the right bank of the Dnieper, 100 m. s.w. of Smolensk. It is the seat of a Greek archbishop, and of the Roman Catholic primate of Russia and Poland, besides being the favorite residence of many of the Russian nobility. It possesses a fine Greek cathedral, built in 1780, 20 Greek, 1 Lutheran, and 4 Roman Catholic churches, several synagogues, and a variety of religious, educational, and charitable institutions. Its streets are wide, straight, and well paved, and there is a fine promenade bordered with trees, whence a beautiful view of the valley of the Dnieper is obtained. Pop. '80, 40,431, of whom one-third are Jews. There is a large export trade to the chief ports of the Baltic and Black seas.

MOHILEV, or MOGILOW, a district town on the s.w. frontier of the government of Podolia, European Russia, is situated on the left bank of the Dniester, 50 m. e. by s. from Kaminetz. Pop. '80, 18,130. It carries on an active trade with the adjacent Russian provinces, and with the Turkish principalities of Moldavia and Wallachia. The climate is so mild, that silk and other products of warm climates are extensively produced.

MOHL, HUGO, VON, 1805–72, b. Stuttgart: studied medicine and natural sciences at Tübingen, and was professor of botany and director of the botanic garden in Tübingen in 1835. His works were numerous, and he is of high authority on vegetable physiology.

MOHL, JULIUS VON: 1800–76; b. Stuttgart: studied Persian and Chinese at Tübingen, Paris, London, and Oxford; was professor of oriental literature in Tübingen, 1826–32; went to Paris and became professor of Persian at the college de France in 1845, and in 1852 director of the oriental department of the national printing-office. His principal work is his edition of Firdusi's *Shah Nameh*, and many Chinese and other oriental works. He published also *Dante et les origines de la littérature italienne.*

MÖHLER, JOHANN ADAM, one of the most distinguished modern polemical divines of the Roman Catholic church, was b. of humble parentage at Igersheim, in Würtemberg, May 6, 1796. He received his early education at the gymnasium of Mergentheim, whence, in his 17th year, he was transferred, for the higher studies, to the lyceum of Ellwangen; and soon afterward entered upon the theological course in the university of Tübingen. He received priest's orders in 1819, and for a short time was employed in missionary duty; but, in 1820, he returned to college life, for two years was engaged as classical tutor; but, in 1822, the offer of a theological appointment in the university of Tübingen finally decided his choice of the study of divinity. He was permitted, before entering on his studies, to spend some time in making himself acquainted with the routine of the theological courses of other universities—as Göttingen, Berlin, Prague, Vienna, and Landshut; and in 1823 he entered upon his new position. In 1828, in which year he was also admitted to the degree of doctor of divinity, he was appointed ordinary professor of theology. His earliest publication was a treatise *On the Unity of the Church* (1825), which was followed, in 1827, by a historico-theological essay on *Athanasius and the Church of his Time, in Conflict with Arianism.* But his reputation, both posthumous and among his own contemporaries, rests mainly on his well-known *Symbolism; or the Doctrinal Differences between Catholics and Protestants, as represented by their Public Confessions of Faith* (1832). This remarkable book at once fixed the attention of the theological world. It passed through five large editions in six years. It was translated into all the leading languages of Europe, and drew forth numerous criticisms and rejoinders, the most considerable of which is that of Dr. F. C. Baur (q.v.), 1833. To this Möhler replied in 1834, by a work entitled *Further Researches into the Doctrinal Differences of Catholics and Protestants.* The polemical bitterness evoked by these controversies made it desirable that Möhler should leave the university of Tübingen. He was invited to Breslau, and also to Bonn, but ultimately selected (1835) the university of Munich, then in the first flush of its efficiency, under king Louis. His first appointment was nominally the chair of biblical exegesis, but he really devoted himself to the department of church history, in which his opening course was eminently successful; but, unhappily, a naturally delicate constitution began to give way under the constant fatigues of a student's life; and although he continued, under all these disadvantages, to maintain and to add to his reputation, and although, in 1837, the invitation to the Bonn professorship was renewed in still more flattering terms, he gradually sunk under consumption, and died April 12, 1838. His miscellaneous works were collected and published posthumously, in 2 vols. 8vo (1839–40), by his friend, the now celebrated Dr. Döllinger. Möhler may be regarded as at once the most acute and the most philosophical of the modern controversialists of his church. He deals more, however, with the exposition of the points and the grounds of the doctrinal differences of modern sects, than with the discussion of the scriptural or traditional evidences of the peculiar doctrines of any among them.

MO'IDORE, a former gold coin of Portugal, of the value of 4,800 reis, or nearly 27s. sterling. It was also called *lisbonine.*

MOIGNO (DE VILLEBEAU), FRANÇOIS NAPOLÉON MARIE, 1804; b. in Morbihan, France; educated in Jesuit schools and colleges; was made abbé in 1830. In 1836 his advancement in mathematical studies gave him a professorship in Paris. He afterwards contributed articles on religious subjects to the *Univers* and other church journals, and in 1840 published *Leçons de Calcul Diferential et Intégral.* In 1845 he became the scientific editor of *L'Époque;* in 1849–50 traveled and contributed to the *Presse* and *Pays*, in 1852 became editor-in-chief of the *Cosmos*, a scientific weekly in Paris, and in 1878 professor in the univ. of Rome. His reputation as a linguist and scientist is based on a large number of published works. Among them is one designed to harmonize state with religious instruction, entitled *Principes Fondamentaux d'apres laquels Doivent se Résondre les deux Grandes Questions des Rapports de l'Église et de l'État et de l'Organization de l'Enseignement*, etc., published in 1846 in Paris.

MOIR, DAVID MACBETH, 1798–1851; b. at Musselburgh, Scotland; was educated at the grammar school, and at the age of 13 was apprenticed for four years to Dr. Stewart, a medical practitioner. At the close of his apprenticeship he finished his course at Edinburgh, and received his diploma as surgeon in 1816. Towards the close of his college course he sent forth an anonymous publication entitled *The Bombardment of Algiers and other Poems.* In 1812 he appeared in print with two short essays in prose in a local magazine. Returning home he devoted himself to literature. In 1817 he joined Dr. Brown as a partner in an extensive medical practice in Musselburgh. His evenings and nights he spent in literary study. Having previously contributed in prose and verse to

the *Scot's Magazine* and to Constable's *Edinburgh Magazine*, he became a constant contributor in prose and verse to *Blackwood's Magazine*, which was started about that time. His verse was both comic and serious. Among his clever comic effusions were *The Exe of St. Jerry* and *The Auncient Waggonere*. His serious poems had the signature △, from which he obtained the literary cognomen of *Delta*. His connection with *Blackwood* continued till his death. In 1823 he formed a strong friendship for John Galt, the novelist, who, being suddenly called off to America before finishing his novel *The Last of the Lairds*, commissioned Moir to write the concluding chapters for him. In 1824 he published the *The Legend of Genevieve and other Tales and Poems*, comprising selections from his magazine articles, with some original additions. In 1824 he began in *Blackwood* his novel of *The Autobiography of Mansie Wauch*, which was continued for nearly three years, and published in a volume. Though urged to remove to the metropolis, where he would have a more lucrative practice and a larger circle of literary friends, he preferred the scenes of his early days and his practice among the poor. His practice was so extensive that for ten successive years he never slept a night out of Musselburgh. In 1829 he published *Outlines of the Ancient History of Medicine, being a View of the Healing Art among the Egyptians, Greeks, Romans, and Arabians.* In 1832 he greatly exerted himself to check the cholera, and published, as secretary of the board of health, *Practical Observations on Malignant Cholera*, and *Proofs of the Contagion of Malignant Cholera.* In 1843 he published *Domestic Verses*, in which he records with tenderness the loss of his two sons. In 1846 he was thrown from a carriage and rendered lame for life. In 1851 he delivered a course of six lectures on the poetical literature of the past half century at the Edinburgh philosophical institution, which were afterwards published. In the same year he published *Selim*, his last contribution to *Blackwood's Magazine.* His contributions to *Blackwood* alone number 370. The poems of Moir are graceful and pathetic. A selection of his poetical works in two volumes was published by Thomas Aird with a memoir of the author.

MOIRA, Earl of. See Hastings, Francis Rawdon.

MOIRE, the French name (formerly *mohère*, and supposed to be taken from the Eng. *mohair*, which is itself probably of eastern origin) applied to silks figured by the peculiar process called watering. The silks for this purpose must be broad and of a good substantial make; thin and narrow pieces will not do: they are wetted and then folded with particular care to insure the threads of the fabric lying all in the same direction, and not crossing each other except as in the usual way of the web and the warp. The folded pieces of silk are then submitted to an enormous pressure, generally in a hydraulic machine. By this pressure the air is slowly expelled, and in escaping draws the moisture into curious waved lines, which leave the permanent marking called watering. The finest kinds of watered silks are known as moirés antiques.—The same process has been applied to woolen fabrics called moreen, which is only an alteration of the word moire.

MOIRÉE MÉTALLIQUE, a French term applied to tin-plate upon which a peculiar figuring like that caused by frost on windows is produced by dipping plates, in a heated state, into nitro-muriatic acid, and then washing with water to remove the acid. When dry the plates are varnished or lacquered, and have a pretty effect. The cheapness and ease of the process have made it very common for inferior articles in tin.

MOISSAC, a t. of France, in the department of Tarn-et-Garonne, on the river Tarn, 15 m. n.w. of Montauban. The church of St. Pierre dates from the year 1100, and contains some excellent carvings and curious fantastic sculptures. Moissac is the center of an important trade in grain. Pop. '76, 5,675.

MOKAN'NA, or Atha-Ben-Hakem. See Mohammedan Sects, *ante.*

MO'LA, a city and sea-port of the Italian province of Bari, delightfully situated among gardens and olive groves on the Adriatic, 13 m. from Bari. It contains fine churches and other edifices, and excellent streets. From all accounts it seems to have exceedingly little trade of any kind. Pop. 12,181.

MOLASSE'. See Mollasse, *ante.*

MOLAS'SES. See Sugar.

MOLAY, Jacques de, 1244–1314; b. Burgundy; of the families of Longvic and Raon. Nothing is known of his early life but that he was admitted to the order of knights templars at Baune, in the diocese of Autun, and was promoted to be grand-master about 1298. This was in the reign of Philip IV., who was endeavoring to replace the feudal system in France by a powerful monarchy, and who viewed with fear and distrust the growing influence of the knights templars. The success which had characterized the crusades, and which had been largely the work of this and the other Christian orders, had now deserted them. Syria had again fallen a prey to the Mohammedans, and the knights templars and hospitalers had retired to Cyprus, whence they sent forth a cry for help to the Catholic hierarchy and the Christian powers throughout

Europe. But Europe was itself torn by the dissensions of petty potentates. De Molay, however, determined to effect by strategy what he could not control by force; and, taking advantage of the movement of the Mogul Tartars against Syria and Egypt, ingratiated himself with the grand khan, and actually received command of one wing of his army, with which he invaded Syria in the spring of 1299. With the troops under his control he recovered Jerusalem from the infidels, and so awakened enthusiasm that a new crusade was urged upon the pope and the kings of France and England. But the unexpected success which had been achieved by Tartar aid was short-lived. In the following year the army of the grand khan was destroyed and Jerusalem again lost to the Christians. The templars returned to the island of Tortosa near Tripoli, with Jacques de Molay still at their head. They were attacked and defeated in 1302, and obliged to flee to Cyprus. It was now that Philip IV. undertook to carry out the project which he had formed to destroy the order whose supremacy he feared. The order was at this time powerful, well-organized—comprising most of the great nobles of Europe—and wealthy to a degree to excite the cupidity of so greedy a monarch as Philip. In the grasp of a mind so broad and a temperament so energetic as those of De Molay, its possible future might well occasion dread to the ambitious and envious. With a design to impose upon the credulity of De Molay, Philip pretended to be anxious for a new crusade, and at his instigation Clement V. called the grand-masters of the templars and hospitalers to Europe. The call was answered by De Molay, among the rest, who appeared in Paris in Aug., 1306, accompanied by a chosen band of distinguished knights of the order, and loaded with treasure. He made a triumphal entry into the capital, a fact which did not tend to allay the suspicions or alter the determination of the king, though he received his visitors with due hospitality. Repairing to Poictiers to render his allegiance to the pope, De Molay took the opportunity to ask an investigation of sinister rumors which had been spread abroad by the enemies of the order. The pope, under the influence of Philip, directed that such an investigation should be undertaken; when the latter, assuming the order to be permission for active proceedings against the order, procured the arrest of every templar in France, and Oct. 13, 1307, Jacques de Molay was seized in the house of the temple and summoned before the inquisition. Although the pope was indignant at this liberty on the part of Philip, and took action to suspend the power of the inquisition in the premises, the king persisted in his determination, and in May, 1310, caused 54 of the templars to be burned at the stake. De Molay was now put under examination by a papal commission, and was condemned to death. He was dragged to the stake, loaded with fetters, "a feeble old man, bent and whitened by age and captivity," and died protesting to the end the innocence of the order—of which he was the last grand-master.

MOLD (anciently *Monte Alto;* Welsh, *Wyddgrug*), a parliamentary borough in the county of Flint, situated on the Alun, 12 m. w.s.w. of Chester. Though Flint is the county town, the assizes and quarter-sessions for the county are held here. The town possesses a good market, a fine old church, and several dissenting chapels. It is connected with England by a branch of the Chester and Holyhead railway. The neighborhood abounds with mineral wealth, coal and lead being the principal produce; it has also numerous interesting relics of antiquity—e. g., so-called Druidic circles, Roman roads and encampments, Saxon earthworks, an eminence called *Bryn Beili* (formerly surmounted by a castle), and a castellated building known as the tower of Rheinallt ab Gruffydd, the two latter having been scenes of frequent contentions between the English and Welsh. Many old families have mansions in the neighborhood, whose pleasing variety of scenery renders it attractive. Pop. of parliamentary borough (1881), 4,320.

MOLDAU (Bohemian, *Vitava*), the chief river of Bohemia, and an important tributary of the Elbe, rises in the Böhmerwald mountains, on the s.w. frontier, at an elevation of 3,750 ft. above the level of the sea, and flows s.e, to Hohenfurth, where it bends northward, and pursues that direction to its confluence with the Elbe opposite Melnik, after a course of 276 miles. Its course to the point of confluence is longer than that of the Elbe, and the navigation of that river is greatly facilitated by the body of water which it contributes. It receives on the left, the Wotawa and the Beraun; and on the right, the Luschnitz and the Sazawa. The chief towns on its banks are Krumau, Budweis, and Prague. It becomes navigable from Budweis.

MOLDA'VIA AND **WALLA'CHIA,** two states forming the so-called *Danubian Principalities,* which, since Dec. 23, 1861, have been united under one prince and one administration, and officially bear the single name of ROUMANIA or RUMANIA. Formerly subject to the Porte, Roumania proclaimed its own absolute independence in 1877, and had its claim recognized at the Berlin Congress of 1878. It was proclaimed a kingdom in 1881. Roumania obtained the Dobrudscha (q.v.) in 1878, and Roumanian Bessarabia (q.v.) was ceded to Russia.

1. MOLDAVIA (Ger. *Moldau,* Turk. *Bogdan*) is bounded on the n. and e. by Russia, on the s. by Wallachia, and on the w. by Hungary. Area, since the cession of Bessarabia, about 15,000 sq. miles. The country forms, geographically, part of the great plain of south Russia, except towards the w., where there are spurs from the Carpathians. It is watered by the Prath, the Sereth, and the Danube, and is almost everywhere fertile, pro-

ducing considerable quantities of grain, fruit, and wine. But the riches of the country consist mainly in its cattle and horses, of which immense numbers are reared on its splendid and far-stretching pastures; swine and sheep are also numerous; and the rearing of bees, owing to the multitude of lime-trees, is extensively carried on. The great plagues of the land are locusts and earthquakes. Minerals and precious metals are said to be abundant, but they have not as yet been worked. There are only a few salt-pits near Okna, in the Carpathian mountains. Trade is almost exclusively in the hands of the numerous Jews, Germans, Greeks, and Russians who have settled in the country. The capital of Moldavia is Jassy (q.v.); but the great center of trade is Galacz (q.v.), where, of late, several British merchants have established houses. The principal exports are grain, wool, lambs' skins, hides, feathers, maize, tar, tallow, honey, leeches, cattle, and salt (in blocks); the imports are chiefly the manufactured products of western Europe. Moldavia is divided into 13 districts, each of which has a prefect or governor, a receiver-general of taxes, and a civil tribunal consisting of a president and two other judges.

2. Wallachia, the larger of the united Danubian principalities, is bounded on the n. by the Austrian empire and Moldavia, on the e. and s. by the Danube, and on the w. by the Austrian empire and the Danube. Length from the western frontier to cape Kaliakra on the Black sea, 305 m.; greatest breadth, 130 m.; area, 27,500 sq.miles. The greater part of Wallachia is quite flat; but in the n., where it borders on Hungary and Transylvania, it gradually rises up into a great mountain-wall, impassable save in five places. It is destitute of wood throughout almost its whole extent; and especially along the banks of the Danube, is covered with marshy swamps, miles upon miles in breadth. The principal river flowing *through* the country is the Aluta, which joins the Danube at Nikopol. The climate is extreme: the summer heats are intense; while in winter, the land lies under deep snow for four months. The principal products are corn, maize, millet, wine, flax, tobacco, and olive-oil. The vast treeless heaths afford sustenance to great herds of cattle, sheep, and horses. As in Moldavia, agriculture is an important branch of industry; and the swampy districts of the south are haunted by immense numbers of wild water-fowl. In minerals—especially gold, silver, copper, and rock-salt—the soil is rich, but only the last of these is extensively worked. Bucharest is the capital of Wallachia and of Roumania. The pop. of Roumania, though the loss of Bessarabia was not balanced by the gain of the Dobrudscha, was still estimated in 1880 at 5,376,000.

Administration.—The king of Roumania—till of late styled by the Roumans *domnu or domnitor;* officially called by the sublime porte *woiwod* (prince); by the Turks generally, *ijauer-effendi* (lord of the unbelievers); and by the Russians, *hospodar* or *gospodarj* (prince)—is now the head of an independent, constitutional and hereditary monarchy. By the treaty of Paris (1856) and the convention (1858), Moldavia and Wallachia were politically united under one prince, with a special ministry for each country, two elective assemblies, and a central commission, which had its seat at Fokshani. But in Nov., 1861, the sultan sanctioned the admistrative union of the two states; and in the following month it was publicly proclaimed at Bucharest and Jassy. The first ruler of Roumania, prince Alexander John Couza, was forced to abdicate in 1866, when Karl I., son of the prince of Hohenzollern-Sigmaringen, was chosen his successor. At the same time a new and more popular constitution was adopted by a constitutent assembly elected by universal suffrage. The legislative power is vested in two houses, a senate and a chamber of deputies. The former consists of 76 and the latter of 157 members, of whom 82 are for Wallachia and 75 for Moldavia. The members of both houses are chosen by indirect election—i. e., the first voters nominate electors, who choose the members. All citizens who have reached their 25th year, and who can read and write, are voters in the first instance, and every Rouman who possesses a small yearly income is eligible for a seat in parliament. The prince has a suspensive veto over all laws passed by both chambers. He is also chief of the executive, which is composed of a council of seven ministers, heads of the departments of the interior, of foreign affairs, of war, of finance, of justice, of commerce and agriculture, and of religion and public instruction. Judges are removable at the pleasure of the superior authorities. The legal codes are founded upon the civil law and the customs of the principalities; but though the system of jurisprudence has been much amended, many reforms remain to be effected, especially in the administration of the laws, which is said to be most corrupt.

Religion.—The established religion of Roumania is that of the Greek church, to which nearly the whole population belong; but all forms of Christianity are tolerated, and their professors enjoy equal political rights. At the head of the Greek clergy stand the metropolitan archbishops of Moldavia and Wallachia, the latter of whom is primate of Roumania. Every bishop is assisted by a council of clergy, and has a seminary for priests; the superintendent of the preaching clergy is the *proto-papa* of the diocese. The ecclesiastical wealth of the country was formerly very great, but the increased expenditure that followed the union of the two states rendered a scheme of spoliation the only means left to the government to extricate itself from its difficulties—in a word, the convent-properties were wrested from the hands of the Greek monks, and placed under the administration of the state. It had been the fashion to establish such convents in Turkey as supports to the orthodox faith, and the institutions in the principality itself were richly endowed in land and other ways: it was resolved to apply the revenues

to the relief of national needs, such as schools, hospitals, the support of the poor, etc., and to give only the overplus to the clergy. This has considerably increased the revenue of the state. The administration, however, is now put upon a better footing.

Education.—There are upwards of 2,000 elementary schools, besides normal schools, gymnasia, private schools, etc., in all about 2,500 schools. There are two universities. Education is gratuitous and compulsory. There are numerous French boarding-schools, and French is now the language of the educated circles, especially ladies (as Greek used to be), but the state language and the proper national tongue is the Romanic.

Army.—The military forces are divided thus : (1) the active army, divided into the *permanent* army and the *territorial* army, with the reserve of each ; (2) the militia ; (3) the civic guard of the towns, and the *levée en masse* of the country districts. All Roumanians are bound to serve in the active army and its reserve 8 years. It depends on the lot in which army one shall serve. The militia is composed of all those who, for legal reasons, have not gone into the active army, and of those who have served in the active army and the reserve, but are not yet 36 years of age. The permanent (peace) army is about 20,000 men ; in war, 140,000 (if needed). The navy consists of 4 steamers and 6 small gunboats.

Commerce.—The total value of the imports of Roumania from the United Kingdom in 1884 amounted to about £1,402,441 ; and of the exports, about £3,316,442. The principal article of export is grain, especially wheat and maize. Roumanian industry has largely profited by the construction in recent years of several lines of railway. In 1869 the first line, 42 English miles in length, was opened from Bucharest to Giurgevo on the Danube, and in subsequent years, a network of railways was completed, connecting the capital with western Europe through the towns of Pivesti, Buzeo, Braila, Tekutch, Roman, and Suceava, and from thence to Lemberg in Austria. In 1881 there were 890 m. of railroad. In 1884 there were also 5106 miles of telegraph in the principalities. The estimated revenue in 1884 was £5,257,823, just balanced by the expenditure ; the public debt was, about £56,563,212.

Race, Language, and Literature.—The great majority of the inhabitants are known in western Europe as Wallachs, but they call themselves Romëni. The Wallachs, however, are not confined to the principalities, but inhabit also the southern part of Bukowina, the greater part of Transylvania, eastern Hungary, a part of the Benat, Bessarabia, some districts in Podolia and Kherson, and portions of eastern Servia. They are also found in Macedonia, Albany, and Thessaly. They are a mixed race, produced by the amalgamation of the emperor Trajan's Roman colonists with the original Dacian population, and subsequently modified by Grecian, Gothic, Slavic and Turkish elements. This mixture is seen in their language, three-fourths of the words of which are Latin (the Dacian has disappeared), while the remaining fourth is made up of words from the other four languages. Roumanian literature is rich in popular songs, a collection of which was translated into German by the Queen of R., 1881 ; since the 16th c. many works in prose have appeared, and of late years two political journals have been established. For grammatical information, see Diez, *Grammatik der Romanischen Sprachen* (4th ed., 1877) ; the *Dictionariul* (1873) and the Glossaries of the Bucharest Academy ; and the admirable Dictionnaire d'Etymologie Daco-Romane (1880), by A. de Cihac.

Social Condition.—Very recent statistics on this point are not attainable. In Moldavia there are rather less, in Wallachia considerably more than 3,000 bojars, besides whom there is an extensive inferior nobility. In Wallachia every twenty-eighth man is a nobleman; every one hundred and thirty-third a merchant; and in the capital every twentieth is a merchant. The free peasants, or yeomen, called *Reseschs*, are not numerous—in all Wallachia there are under 5,000. Gypsy communities are an important element in the population; upwards of 150,000 of this mysterious race are or were serfs belonging to the rich bojars and the monasteries. In 1844 about 30,000 were emancipated, and settled in colonies in different parts of the land; they call themselves *Romnitschel* or *Romni*. The common people are on the whole good-humored, frugal, sober, and cleanly; murder and larceny are almost unknown. Their dwellings, however, are, as may be supposed, of the most wretched description; composed chiefly of interlaced willow-withes, covered with mud, cane, and straw.

History.—In ancient times Moldavia and Wallachia formed an important part of Dacia (q.v.), and the two countries have in general experienced the same vicissitudes. At the period of the migration of nations, and in the following centuries they were the scene of the struggles between the Gothic, Hunnic, Bulgarian, and Slavic races—the Avari, Chazars, Petschenegi, Uzi, and Magyars, who alternately ruled or were expelled from the country. These peoples all left some traces (more or less) of themselves among the Romanized Dacian inhabitants, and thus helped to form that composite people, the modern Wallachs, who, in the 11th c., were converted to the Christianity of the Eastern or Greek church. Their incursions, however, frightfully devastated the country. In the 11th c., the Kumans, a Turkish race, established in Moldavia a kingdom of their own. Two centuries later the great storm of Mongols broke over the land. It now fell into the hands of the Nogai Tartars, who left it utterly wasted, so that only in the forests and mountains was any trace left of the native Wallachian population. In the latter half of the 13th c., a petty Wallach chief of Transylvania, Radu Negru of Fogarasch, entered

Wallachia, took possession of a portion of the country, divided it among his bojars (noble followers), founded a senate of 12 members, and an elective monarchy; and gradually conquered the whole of Wallachia. Rather less than a century later (1354), a similar attempt, also successful, was made by a Wallach chief of the Hungarian Marmarosh, of the name of Bogdan, to re-people Moldavia. In the beginning of the 16th c., both principalities placed themselves under the protection of the Porte, and gradually the bojars lost the right of electing their own ruler, whose office was bought in Constantinople. After 1711 the Turks governed the countries by Fanariot princes (see FANARIOTS), who in reality only farmed the revenues, enriched themselves, and impoverished the land. In 1802 the Russians wrested from Turkey the right of surveillance over the principalities. A great number of nobles—through family marriages with the Fanariots—were now of Greek descent, the court-tongue was Greek, and the religious and political sympathies of the country were the same. Hence the effort of the principalities in 1821 to emancipate themselves from Turkish authority, which was only the prelude to the greater and more successful struggle in Greece itself. In 1822 Russia forced Turkey to choose the princes or hospodars of Wallachia and Moldavia from natives, and not from the corrupt Greeks of Constantinople; and after 1829, to allow them to hold their dignity for life. The principalities, united under one ruler in 1858, were brought under one administration in 1861, and proclaimed a kingdom, 1881. See ROUMANIA.

MOLE, *Talpa,* a genus of quadrupeds of the order *insectivora,* and family *talpidæ.* All the *talpidæ* live chiefly underground, and their structure is adapted to their mode of life. In their general form, the character of their fur, the shortness of their limbs, the great muscular strength of the fore-parts, and great breadth of the fore-paws, the elongated head, the elongated and flexible snout, the smallness of the eyes, and the complete concealment of the ears, they all resemble the COMMON MOLE (*T. Europæa*), with which also they pretty nearly agree in the nature of their food, their mode of seeking it, their dentition, and the shortness of their alimentary canal.—The common mole is abundant in most parts of Europe, except the utmost n. and the utmost south. In Britain it is very plentiful, except in the n. of Scotland; but is not found in Ireland nor in some of the Scottish islands. Instead of its ordinary uniform black color, it is occasionally found yellowish white, or gray, and even orange. Its silky or velvety fur lies smoothly in every direction, the short hairs growing perpendicularly from the skin; a peculiarity which preserves it clean as the animal moves either backwards or forwards in its subterranean galleries. The fore-paws are not only very broad, but are turned outwards, for the better throwing back of the earth in burrowing. They are terminated by five long and strong claws. The phalangeal bones are remarkable for breadth and an elongated bone of the carpus gives additional strength to the lower edge of the paw. The two bones of the forearm are fastened together. The shoulder-blades and the clavicles are very large: and the sternum has an elevated ridge as in birds and bats, for the attachment of powerful muscles. The muscles which move the head are also very powerful, and the cervical ligament is even strengthened by a peculiar bone; the mole making much use of its flexible snout in burrowing. The hinder limbs are comparatively feeble, and the feet small, with five toes. The eyes are black and very small, capable of being partially retracted and exserted. The senses of hearing, taste, and smell are very strongly developed in the mole. The cutting-teeth are very small and sharp; the canines long and sharp; the true molars broad, with many sharp conical elevations. This dentition adapts the animal for feeding not only on worms and grubs, but also on frogs, birds, and small quadrupeds, which accordingly are its occasional prey, although earthworms are its chief food. The mole is an excessively voracious animal; digestion is rapid, and no long interval can be endured between meals, hunger soon ending in death. When pressed by hunger, it will attack and devour even one of its own kind; and its practice is immediately to tear open the belly of any bird or quadruped which it has killed, and inserting its head, to satiate itself with the blood. In eating earthworms, it skins them with remarkable dexterity. In quest of them, it works its way underground, throwing up the earth in mole-hills; more rarely in the fine nights of summer it seeks for them on the surface of the ground, when it is itself apt to be picked up by an owl equally in want of food. The habitation of the mole is of very remarkable construction; a hillock of earth larger than an ordinary mole-hill, and containing two circular galleries, one above the other, with five connecting passages, and a central chamber which has access to the upper gallery by three passages; whilst about nine passages lead away from the lower gallery in different directions. The end of a passage entering a gallery on one side is never opposite to the end of a passage entering on the other. To afford all facility of escape in case of any alarm, a passage leads at first downwards from the central chamber, and then upwards again till it joins one of the high roads which the mole keeps always open, which are formed by pressing the earth till it becomes smooth and compact, and are not marked by any mole-hills thrown up, and which not only serve for escape when necessary, but lead to those parts of the creature's appropriated domain where the ordinary mining for worms is to be prosecuted. The nest in which the female mole produces her young is not this habitation, but is formed generally under a mole-hill rather larger than usual, where two or three runs meet, and is lined with leaves and other warm materials. The mole breeds both in spring and autumn, and generally produces four or five young at a birth. The attachment of the parent moles seems to be strong, but transitory.

It has been sometimes alleged that moles eat vegetable as well as animal food, and that they are injurious to farmers, by devouring carrots and other roots; but it appears rather that they only gnaw roots when in the way of their mining operations, or perhaps, also, in quest of grubs which they contain. Moles are generally regarded as a pest by farmers and gardeners, owing to the injury which mole-hills do to lawns and pastures, the burying up of young plants, and the disturbance of their roots. But they are certainly of use in the economy of nature in preventing the excessive increase of some other creatures; and probably also contribute to the fertility of some pastures, by the continual tillage which they carry on. Mole-traps of various kinds are in use, which are planted, if the mole-catcher is skillful, in the often-traversed roads of the animals. Mole-catching has long been a distinct trade in Britain.

The name mole is abbreviated from the old English name *mouldwarp*, or *mouldiwarp*, still provincially used, and which is derived from the Anglo-Saxon *molde*, mould, and *weorpan*, to throw up.

Another species of mole (*T. cæca*) is found in the most southern parts of Europe; very similar to the common mole, but rather smaller, and having the eye always covered by the eyelid, so as to justify Aristotle's statement that the mole is blind.—A species, also very similar to the common mole, is found in North America.

Among the other *talpidæ* are the CHANGEABLE MOLE, or CAPE MOLE (*chrysochloris capensis*) of South Africa, which is remarkable as the only one of the mammalia that exhibits the splendid metallic reflections so frequently seen in some other classes of animals; the SHREW MOLE (q.v.) and the STAR NOSE (q.v.) of North America.

MOLE. See NAEVUS.

MOLÉ, LOUIS MATTHIEU, Comte, a French statesman, and a descendant of the famous French statesman and magistrate, Matthieu Molé (b. 1584; d. 1653), was b. at Paris, Jan. 24, 1781. His father, president of the parliament of Paris, died by the guillotine in 1794. His mother was a daughter of Malesherbes. Molé was for the most part his own preceptor, and displayed a wonderfully precocious love of hard work and independent reflection. In 1805 he published *Essais de Morale et de Politique*, in which he vindicated the government of Napoleon on the ground of necessity. The attention of the emperor was drawn to him; he was appointed to various offices in succession, and raised to the dignity of a count, and to a place in the cabinet. After Napoleon's return from Elba, he refused to subscribe the declaration of the council of state banishing the Bourbons forever from France, and declined to take his seat in the chamber of peers. In 1815 Louis XVIII. made him a peer, and he voted for the death of Ney. In 1817 he was for a short time minister of marine, but afterwards acted independently of party, and was one of the principal orators in the chamber of peers. In 1830 he became minister of foreign affairs in Louis Philippe's first cabinet, but only for a short time. In 1836 he succeeded Thiers as prime minister; but, in the eyes of the liberal party, he displayed too entire a devotedness to the wishes of the king, and thus rendered his ministry very unpopular, so that in 1839 he felt it necessary to resign. In 1840 he was chosen a member of the *Académie Française*. From that time he took little part in political affairs, but after the revolution of 1848 exerted himself, but in vain, to rally and unite the party of order in the assembly to which he had been elected. He died at Champlâtreux, Nov. 23, 1855. Molé was fiercely attacked and abused in the latter part of his political career, but it is not now believed that he was servile toward the court. He detested anarchy, and believed in the necessity of a strong government; but he loved genuine liberty, and always placed the constitution above the king. When Louis Napoleon's *coup d'etat* extinguished the republic, Molé proudly said that henceforth he could have nothing to do with politics.

MOLE-CRICKET, *Gryllotalpa*, a genus of insects of the cricket (q.v.) family (*achetidæ* or *gryllidæ*), remarkable for burrowing habits, and for the great strength and breadth of the fore-legs. The other legs are also large and strong, but of the form usual in the family.—The best known species (*G. vulgaris*) common in many parts of Europe, and pretty abundant in some places in England, but very local—is almost 2 in. long; of a velvety brown color; the wings, when folded, do not cover much more than one-half of the abdomen, although large when expanded. It uses its fore-legs not only for digging burrows in earth, but for cutting through or tearing off the roots of plants which come in its way. The mole-cricket feeds both on animal and vegetable substances, and often does no small injury to crops. The chirping, and somewhat musical call of the mole-cricket, produced in the same way as that of the common cricket, is heard chiefly in the end of spring and beginning of summer, and only in the evening or at night. In some parts of England this sound has gained it the name of *chur-worm*. Another local English name is *croaker*. The female mole-cricket prepares a curious nest, a rounded subterranean cell, about as large as a hen's egg, having a complicated system of winding passages around it, and communicating with it. In this cell she deposits from 100 to 400 eggs. The young live for some time in society. They run actively, both in the larva and pupa states. The mole-cricket is very combative, and the victor generally eats the vanquished.—A species of mole-cricket (*G. didactyla*) does great injury to the plantations of sugar-canes in the West Indies.—A curious Indian insect, of a closely allied genus

(*schizodactylus monstrosus*), has prodigiously long wings, which, as well as the wing-covers, are rolled into spiral coils at the tips.

MOL'ECULE, MOLEC'ULAR VOLUMES. See ATOM; ATOMIC THEORY; CHEMISTRY, *ante.*

MOLENBEEK, ST. JEAN, a t. in Belgium, in the suburbs of Brussels; pop. 37,292. It has a museum of natural science.

MOLE-RAT, *Spalax* or *Aspalax*, a genus of rodent quadrupeds of the family *muridæ*, having teeth almost like those of rats, but in many respects resembling moles, as in general form, shortness of limbs, concealment of ears, smallness or even rudimentary condition of eyes, and burrowing habits—although their food is altogether different, consisting wholly of vegetable substances, and chiefly of roots. One species (*S. typhlus*) inhabits the s. of Russia and some parts of Asia. It is also known as the *Podolian marmot, blind rat, slepez, zemni*, etc. The mole-rat makes tunnels and throws up hillocks like the mole, but its hillocks are much larger.—Another species, found in the Malayan archipelago, is as large as a rabbit.—Nearly allied is the COAST RAT or SAND MOLE of s. Africa (*bathyergus maritimus*), also as large as a rabbit, with other species of the same genus, also natives of s. Africa, which drive tunnels through the sandy soil, and throw up large hillocks.

MOLESCHOTT, JACOB, b. Holland, 1822; took a medical degree at Heidelberg, and began the practice of medicine at Utrecht, whence he removed, in 1847, to Heidelberg, where for seven years he lectured on physiology at the university. A real or supposed tendency towards materialism, in his lectures, alarmed the authorities, and he resigned. Soon after he was appointed professor at Zurich, and in 1861 he was called to the chair of physiology at Turin. His physiological researches, particularly in regard to diet, muscular formation, the blood and bile, are of value. Without asserting the impossibility of a spiritual life, he explains the origin and the condition of animals by the working of physical causes. His characteristic formula is, "No thought without phosphorus." His most important works are: *Lehre der Nahrungsmittel*, 1850, which has been translated into English by Dr. Bonner as *The Chemistry of Food and Diet; Physiologie der Nahrungsmittel*, 1850; *Ursache und Wirkung in der Lehre vom Leben*, 1867; and *Von der Selbstbestimmung im Leben der Menscheit*, 1871.

MOLESKIN AND COR'DUROY are varieties of fustian (q.v.), a term which is used in a generic sense to include also velveteen, velveret, thick-set, thick-set cord, beaverteen, and other stout cotton cloths for men's apparel—a class of goods largely manufactured in Lancashire. The general structure of these fabrics is described under FUSTIAN and VELVET. They are, in point of fact, all of the nature of velvet, with a *nap* or *pile* on the surface, and most of them are twilled.

When cloth of this kind leaves the loom, its surface is covered with loops like Brussels carpet, and these are then cut open with a ripping knife of a peculiar shape, which the operatives learn to use with great dexterity. The hairy and uneven appearance which the cloth acquires in this operation is subsequently improved by the shearing process. The cloth is next steeped in hot water, to get rid of the paste used in dressing the yarn, and is then ready to be passed through the brushing or teaseling machine, which consists of blocks of wood with concave surfaces covered with card-brushes, working backwards and forwards in a lateral direction against wooden rollers, encased in tin plate, over which the cloth passes. The tin plate is made rough with the burs of punched holes. In the next operation, the fustian is singed by passing the nap side quickly over a red-hot metal cylinder. The brushing and singeing are repeated three and occasionally four times, to give the cloth a smooth appearance. It is then washed, bleached with chloride of lime, and dyed—usually of some shade of olive, slate, or other quiet color.

The different names given to fustian cloths depend upon their degree of fineness, and the manner in which they are woven and finished. Thus, smooth kinds, of a strong twilled texture, are called *moleskins* when shorn before dyeing, and *beaverteens* when cropped after dyeing. Corduroy, or king's cord, is produced by a peculiar disposition of the pile-threads. In all fustians, there is a warp and weft thread, independent of the additional weft-thread forming the pile; but in corduroys, the pile-thread is only "thrown in" where the corded portions are, and is absent in the narrow spaces between them.

Until a comparatively recent period, the quantity of fustian cloths annually consumed in the British islands must have been very large, but the increased price of cotton, and the introduction of cheap woolen fabrics, have now very much curtailed the use of them. They are still, however, largely worn by certain classes of mechanics and laborers.

MOLESTA'TION, in Scotch law, means disturbing the possession of heritage, and an action of molestation is a remedy for the trespass.

MOLESWORTH, GUILFORD LINDSAY, b. England, 1828; educated at the college of civil engineers at Putney. In 1852 he became chief assistant engineer of the London, Brighton, and South Coast railroad, but soon resigned to conduct the constructions at Woolwich arsenal during the Crimean war. After practicing his profession in London for a number of years, he went to Ceylon, and in 1862 became chief engineer of the gov-

ernment railroad in that island. In 1867 he was appointed director of public works; and in 1871 consulting engineer to the Indian government. He has published a *Pocket-book of Engineering Formulæ.*

MOLESWORTH, Sir WILLIAM, Right Honorable (eighth baronet), English statesman, was b. in 1810. Lineally descended from an old Cornish family of large possessions (the first baronet was president of the counеil in Jamaica in the time of Charles II., and subsequently governor of that island), he early showed promise of distinction. His university career at Cambridge was, however, cut short by his sending (under circumstances of great provocation) a challenge to his tutor to fight a duel. He continued his education at the university of Edinburgh, and subsequently at a German university. After making the usual tour of Europe, he returned home, and threw himself, in 1831, into the movement for parliamentary reform. Next year, although only just of age, he was elected member of parliament for Cornwall (East). He sat for Leeds from 1837 to 1841, and then remained out of parliament four years, during which interval he used to say he gave himself a second and sounder political education. He was the intimate friend of Bentham and James Mill, and was regarded as the parliamentary representative of the "philosophical radicals." Having been a great admirer of Hobbes, he accumulated materials for a life of the "Philosopher of Malmesbury," which remains in MS. uncompleted. In 1839 he commenced and carried to completion, at a cost of many thousand pounds, a reprint of the entire miscellaneous and voluminous writings of that eminent author. The publication was a valuable contribution to the republic of letters, and the works of Hobbes were placed by Molesworth's munificence in most of our university and provincial public libraries. The publication, however, did him great disservice in public life, his opponents endeavoring to identify him with the freethinking opinions of Hobbes in religion, as well as with the great philosopher's conclusions in favor of despotic government. In 1845 he was elected for Southwark (which he continued to represent until his death), and entered upon a parliamentary career of the greatest energy and usefulness. He was the first to call attention to the abuses connected with the transportation of criminals, and as chairman of a parliamentary committee brought to light all the horrors of the convict system. He pointed out the maladministration of the colonial office, explained the true principles of colonial self-government, prepared draught constitutions for remote dependencies, and investigated the true and natural relations between the imperial government and its colonial empire. Molesworth's views, although at first unpalatable to the legislature, have been adopted by successive administrations, and are now part and parcel of the colonial policy of Great Britain. In January, 1853, he accepted the office of first commissioner of public works, in the administration of the earl of Aberdeen; and in 1855 the post of secretary of state for the colonies, in that of viscount Palmerston. This appointment gave great satisfaction to our dependencies; but before he could give proof of his administrative capacity, he was (Oct. 22, 1856) struck by the hand of death, while yet in the full vigor of life and intellect. He established the *London Review*, a new quarterly, in 1835; and afterwards purchased the *Westminster Review*, the organ of the "philosophical radicals." The two quarterlies being then merged into one, under the title of the *London and Westminster*, Molesworth contributed to it many able articles on politics and political economy.

MOLESWORTH, WILLIAM NASSAU, b. England, 1816; was educated at Cambridge and entered the English church. He was presented to St. Andrews, Manchester, in 1841, and to St. Clement Spotland, Rochdale. He was a strong advocate of co-operation, and had an interest in the well-known experiment of co operation at Rochdale. His most important writings are *A History of the Reform Bill of* 1832 and *History of England from the Year* 1830, 3 vols., 1871–73. He d. 1877.

MOLFET'TA, a city of southern Italy, in the province of Bari, situated on the Adriatic, 18 m. n.w. of Bari; pop. '81, 29,697. The neighborhood yields excellent fruits, especially almonds and oranges, and has extensive olive plantations. Fish abound along the coast. The city contains a magnificent cathedral, and is partly inclosed by walls; it is conjectured that it occupies the site of some early forgotten town, from the numerous vases, urns, and other relics of antiquity found in its vicinity.

MOLIÈRE, JEAN BAPTISTE (properly, *Jean Baptiste Poquelin*—the name of Molière not having been assumed till he had commenced authorship, was b. at Paris, Jan. 15, 1622. His father, Jean Poquelin, was then an upholsterer, but subsequently became a valet-de-chambre to the king. Regarding the boyhood of Molière almost nothing is known, but his credulous biographers have put together whatever traditionary gossip they could find floating on the breath of society. Voltaire, while recording these *contes populaires*, as he calls them, pronounces them *très-faux*. All that we really are certain of is that in his 14th year he was sent to the Jesuit *collége de Clermont* in Paris, where he had for a fellow-student prince Armand de Conti, and that, on leaving the college, he attended for some time the lectures of Gassendi. He was charmed, we are told, by the freedom of thought permitted in speculative science, and, in particular, conceived a great admiration for Lucretius, the Roman poet-philosopher, whom he undertook to translate. Of this translation, only a single passage remains, intercalated in the *Misanthrope* (act ii. scene 4). About 1641 he commenced the study of

law, and appears to have even passed as an advocate; but the statement of Tallement des Réaux that he actually ventured into the precincts of theology, is generally rejected. Molière detested priests. So gay, humorous, and sharp-eyed a humanitarian would have felt quite miserable under the restraints of a monkish life. In 1645 he suddenly appeared upon the stage as member of a company of strolling players, which took the name of the *Illustre Théâtre*, and performed at first in the faubourgs of Paris, and afterwards in the provinces. For the next 12 years we can only catch an occasional glimpse of him. He was playing at Nantes and Bordeaux in 1648, at Narbonne and Toulouse in 1649, at Lyons in 1653 (where his first piece, *L'Etourdi*, a comedy of intrigue, was brought out), at Lyons and Narbonne again in 1655, at Grenoble during the carnival, and also at Rouen in 1658. During these now obscure peregrinations, he seems, although an industrious actor, to have been also a diligent student. He read Plautus, Terence, Rabelais, and the Italian and Spanish comedies, besides—without which, indeed, all the rest would have been of little avail—making a constant use of as quick eyes as ever glittered in a Frenchman's head. At Paris, by the powerful recommendation of his old schoolfellow, the prince de Conti, Molière's company got permission to act before the king, who was so highly pleased, that he allowed them to establish themselves in the city under the title of the *Troupe de Monsieur*. In 1659 Molière brought out *Les Précieuses Ridicules*, the fine satire of which—lapsing at times, however, into caricature—was instantly perceived and relished. "*Courage, Molière!*" cried an old man on its first representation; "*voilà la véritable comédie.*" The old man was a prophet. Veritable comedy dated in France from that night. Ménage, the critic, is reported to have said to Chapelain the poet, as they were going out of the theater: "Henceforth (as St. Remi said to Clovis), we must burn what we have worshiped, and worship what we have burned. In 1660 appeared *Sganarelle, ou le Cocu Imaginaire;* and in 1661 *L'Ecole des Maris*—partly founded on the *Adelphi* of Terence, in which Molière completely passes out of the region of farce into that of pure comic satire—and *Les Fâcheux*. In the following year, Molière married Armande-Grésinde Béjart, either the sister or daughter (for it is still undetermined) of Madeleine Béjart, an actress of his troupe, with whom he had formerly lived in what the French politely call "intimate relations." That, however, there is the slightest ground for supposing that the great comedian incestuously married his own daughter, nobody now believes, though the revolting calumny was freely circulated even in Molière's lifetime. His literary activity continued as brisk as before. Among several pieces belonging to this year, the most celebrated is *L'Ecole des Femmes*, which excited, not without reason, the most violent indignation among the clergy and the devout, for there was an excessive indecency in the expression, and the author indulged in a caricature of religious mysteries that could not but be offensive. Molière defended himself with incredible audacity in his *Impromptu de Versailles*. *Le Tartufe*, written in 1664, was prohibited from being brought upon the stage; but Molière was invited by his literary friends, Boileau and others, to read it in a semi-public manner, which he did with the greatest approbation. In 1665 Louis XIV. bestowed a pension of 7,000 livres on Molière's company, which now called itself the *Troupe du Roi*. Next year appeared *Le Misanthrope*, the most artistic of all his comedies; shortly after followed by *Le Médecin Malgré Lui*. When *Tartufe* was at last brought upon the stage in 1669, it obtained a superb success. The truth, the variety, the contrast of the characters, the exquisite art shown in the management of the incidents, the abundance of the sentiments, and the wonderful alternations of feeling—laughter, anger, indignation, tenderness—make this, in the opinion of most critics, Molière's masterpiece. To the same year belongs *L'Avare*. In 1670 appeared *Le Bourgeois Gentilhomme*, a very pleasant satire on a very prevalent vice among wealthy tradesmen—viz., the vulgar ambition to pass for fine gentlemen. Then came *Les Fourberies de Scapin* (1671), followed by *Les Femmes Savantes* (1672), full of admirable passages; and *Le Malade Imaginaire* (1673), the most popular if not the best of all Molière's comedies. While acting in this piece, he was seized with severe pains, which, however, he managed to conceal from the audience; but on being carried home, hemorrhage ensued, and he expired at ten o'clock at night (Feb. 17, 1673). As Molière had died in a state of excommunication, and without having received the last aids of religion—which, however, he had implored—the archbishop of Paris refused to let him be buried in consecrated ground; but the king interfered—a compromise was effected, and he was privately interred in the cemetery of St. Joseph, being followed to the tomb by a hundred of his friends with lighted torches. In 1792 his remains were transferred to the museum of French monuments, from which they were removed to Père Lachaise in 1817. Molière ranks as the greatest French comic dramatist—perhaps the greatest of all comic dramatists. Among the best editions of Molière's works are those of Auger (1819–25), Aimé-Martin (1833–36), Moland (1871), and Despois (1874 *et seq.*). A complete English translation of Molière's works is that by Van Laun, in 6 vols. (Edin. 1875–76). The best biographies are by Taschereau (1825–27), and Bazin (1851). The books devoted to Molière and his works would themselves form a large library.

MOLINA, Fray Alonso de, 1496–1584; b. Spain; entered the order of St. Francis. He went to Mexico to convert the natives soon after the Spanish conquest, and familiarized himself with the Aztec language. He made translations into Aztec of the catechism and of a confessional manual. He also wrote a grammar of that language, but his great work is his *Aztec-Spanish Dictionary*, completed in 1571.

MOLINA, Louis, a celebrated Spanish Jesuit theologian, was b. at Cuença, in New Castile, in the year 1535; and having entered the Jesuit society in his 18th year, studied at Coimbra, and was appointed professor of theology at Evora, where he continued to teach for 20 years. He died at Madrid in 1600 in the 65th year of his age. Molina's celebrity is mainly confined to the theological schools. His principal writings are a commentary on the *Summa* of St. Thomas (Cuença, 2 vols. 1593); a minute and comprehensive treatise *On Justice and Right* (Cuença, 6 vols. 1592; reprinted at Mainz in 1659); and the celebrated treatise on *The Reconciliation of Grace and Free-Will*, which was printed at Lisbon in 1588, with an appendix, printed in the following year. Although it is to the last-named work that Molina's celebrity is mainly due, we must be content with a very brief notice of it. The problem which it is meant to resolve is almost as old as the origin of human thought itself, and has already led, in the 4th c., to the well-known Pelagian controversy (q.v.). In reconciling with the freedom of man's will the predestination of the elect to happiness, and of the reprobate to punishment, Molina asserts that the predestination is consequent on God's foreknowledge of the free determination of man's will, and, therefore, that it in no way affects the freedom of the particular actions, in requital of which man is predestined, whether to punishment or to reward. God, in Molina's view, gives to all men sufficient grace whereby to live virtuously, and merit happiness. Certain individuals freely co-operate with this grace; certain others resist it. God foresees both courses, and this foreknowledge is the foundation of one or of the other decree. This exposition was at once assailed in the schools on two grounds—first as a revival of the Pelagian heresy, inasmuch as it appears to place the efficacy of grace in the consent of man's will, and thus to recognize a natural power in man to elicit supernatural acts; second, as setting aside altogether what the Scriptures represent as the special election of the predestined, by making each individual, according as he freely accepts or refuses the grace offered to all in common, the arbiter of his own predestination or reprobation. Hence arose the celebrated dispute between the Molinists and the Thomists. It was first brought under the cognizance of the inquisitor-general of Spain, by whom it was referred to pope Clement VIII. This pontiff, in 1697, appointed the celebrated congregation, *De Auxiliis*, to consider the entire question; but notwithstanding many lengthened discussions, no decision was arrived at during the life-time of Clement; and although the congregation was continued under Paul V., the only result was a decree in 1607 permitting both opinions to be taught by their respective advocates, and prohibiting each party from accusing the adversaries of heresy. The dispute, in some of its leading features, was revived in the Jansenist controversy (see Jansen); but with this striking difference, that whereas the rigorous Jansenists denied the freedom of the will when acted on by efficacious grace, all the disputants in the scholastic controversy—even the Thomists—maintain that, in all circumstances, the will remains free, although they may fail to explain how this freedom is secured under the action of efficacious grace. See Aquinas.

MOLINE', a t. in Rock Island co., Ill., on the e. bank of the Mississippi and on the line of the Western Union, Chicago, Rock Island and Pacific, and the Rockford, Rock Island and St. Louis railroads; pop. of township about 7,800. Fine water-power is obtained by a dam reaching from the shore to an island in the river, and from 20 to 25 factories are constantly in operation manufacturing steam-engines, pumps, plows, paper, and many other articles. The place has 3 banks, 4 newspapers, a public library, many churches, and a very fine public school.

MOLINELLA, a t. in the province of Bologna, in n. Italy, between the Reno and Po rivers. Pop. 10,751. The chief industry is the manufacture of cheese and hemp. The town was anciently situated on separate islands formed by changes in the course of the Po; these islands have been joined and built over.

MO'LINISM, the name given to the system of grace and election taught by Louis Molina (q.v.). This system has been commonly taught in the Jesuit schools; but a modification of it was introduced by the celebrated Spanish divine Suarez (q.v.), in order to save the doctrine of *special election*. Suarez held, that although God gives to all grace absolutely sufficient for their salvation, yet he gives to the elect a grace which is not alone in itself sufficient, but which is so attempered to their disposition, their opportunities, and other circumstances, that they infallibly, although yet quite freely, yield to its influence. This modification of Molina's system is called Congruism. Molinism must not be confounded either with Pelagianism or semi-Pelagianism, inasmuch as Molinism distinctly supposes the inability of man to do any supernatural act without grace (q.v.).

MOLI'NO DEL REY. An outpost of Chapultepec, about 2½ m. from the city of Mexico, where occurred a battle Sept. 8, 1847, between the American troops under gen. Winfield Scott and the Mexicans commanded by gen. Santa Anna. Scott's force numbered about 10,000 men; the Mexicans about 7,000 picked men, with a reserve of 12,000. Scott had captured Contreras and Churubusco, and sat down under the walls of Chapultepec from Aug. 20 to Sept. 7, while an armistice existed to enable Nicholas P. Trist, peace commissioner, to conclude an amicable arrangement if possible. At the close of the armistice, the peace negotiations having proved ineffectual, Scott attacked Molino del Rey, which comprised a number of massive stone buildings, about 500 yards in extent, commanded by the defenses of the great fortified castle of Chapultepec, where were

14.000 Mexicans. This position had been originally a flour-mill (*molino*), and was afterwards a foundry for the manufacture of arms, and now a fortress defended by Mexican veterans. It was attacked by Scott on the morning of Sept. 8, and, though the battle was a hard-fought one on both sides, it was carried by storm on the same day, thus opening the way to the capture of Chapultepec and the city of Mexico.

MOLINOS, Michael de, was b. of noble parentage at Patacina, in the kingdom of Aragon, Dec. 21, 1627. He received holy orders and was educated at Pampeluna, and afterwards at Coimbra, at which university he obtained his theological degree. After a career of considerable distinction in his native country, Molinos went to Rome, where he soon acquired a high reputation as a director of conscience and a master of the spiritual life. His private character was in keeping with this public reputation. He steadily declined all ecclesiastical preferment, and confined himself entirely to his duties in the confessional, and in the direction of souls. An ascetical treatise which he published, under the title of *The Spiritual Guide,* added largely to the popularity which he had acquired in his personal relations; but there were not wanting many who, in the specious, but visionary principles of this work, discovered the seeds of a dangerous and seductive error. Among these, the celebrated preacher, F. Segneri, was the first who ventured publicly to call them into question; but his strictures were, by the friends of Molinos, ascribed to jealousy of the influence which Molinos had acquired with the people. By degrees, however, reports unfavorable to the practical results of this teaching, and even to the personal conduct and character of Molinos or of his followers, began to find circulation; and eventually, in the year 1685, he was cited before the holy office, and submitted to close imprisonment and examination. In addition to the opinions contained in his book, a prodigious mass of papers and letters, to the number, it is said, of 20,000, found in his house, were produced against him, and he was himself rigorously examined as to his opinions. The result of the trial was a solemn condemnation of 68 propositions, partly extracted from his *Spiritual Guide,* partly, it would appear, drawn from his papers or his personal professions. These doctrines Molinos was required publicly to abjure, and he was himself sentenced to close imprisonment, in which he was detained until his death in 1696, when he had entered on his 70th year. The opinions imputed to Molinos may be described as an exaggeration of the worst and most objectionable principles of quietism (q.v.). According to the propositions which were condemned by the inquisition, Molinos pushed to such an extreme the contemplative repose which is the common characteristic of quietism, as to teach the utter indifference of the soul, in a state of perfect contemplation, to all external things, and its entire independence of the outer world, even of the actions of the very body which it animates; insomuch that this internal perfection is compatible with the worst external excesses. These consequences are by no means openly avowed in the *Spiritual Guide,* but they appear to follow almost necessarily from some of its maxims, and they are said to have been plainly contained in the papers of Molinos, which were produced at his trial, and to have been admitted by himself. After the death of Molinos, no further trace of his teaching appears in Italy, but it was revived in more than one form in France. See Bigelow's *Molinos the Quietist* (New York, 1882).

MOL'LAH, among the Turks, is the title of a superior judge. The mollahs are divided into two classes: the first of these, four in number, from whom the mollahs at the court of the padishah are elected, possesses jurisdiction over the more important pashaliks (Adrianople, Brusa, Damascus, Cairo); and the second, who only hold their office for the space of a lunar month at a time, and the lowest rank of whom is formed by the naibs, over the inferior provinces, towns, and villages. The mollah is an expounder of civil and criminal law, and of the religion of the state; he is therefore necessarily both a lawyer and an ecclesiastic. Under him is the cadi or judge, who administers the law, and superior to him are the kadhiasker and the mufti (q.v.). They all are, however, subject to the sheikh al islam or supreme mufti. In Persia, the office of mollah is similar to what it is in Turkey; but his superior is there the "sadr," or chief of the mollahs. In the states of Turkistan, the mollahs have the whole government in their hands.

MOLLASSE, an extensive miocene or middle tertiary deposit, occupying the central lake-region of Switzerland between the Alps and the Jura. It consists chiefly of a loose sand, but at the foot of the Alps it usually takes the form of a conglomerate called "Nagel-flue," which is said to attain the astonishing thickness of from 6,000 to 8,000 ft. in the Righi, near Lucerne, and in the Speer, near Wesen. The mollasse contains a few shells and some vegetable remains, among which are several palms.

MOLLER, Georg, 1784–1852; b. Hanover; studied architecture in Carlsruhe and Italy. After his return from Italy he was appointed government architect to the grand duchy of Darmstadt. He designed the ducal palace at Wiesbaden, and a number of the public buildings as well as private residences at Darmstadt. He discovered the original design of the Cologne cathedral, the two towers of which have been finished in accordance with his published fac-simile of that design. His most important publications are: *Monuments of German Art* and *Monuments of German Architecture.*

MOLLITIES OSSIUM, or Osteomalacia, a destructive disease of the bones, characterized by softening and fragility. It has been carefully studied by Curling, Solly,

Stanley, MacIntyre, and Litzmann, and also by Paget and Dalrymple. The bones become bent, their extremities swollen, and their shafts broken in various parts of the body. No callus follows the fracture as in healthy bone, and in consequence the body of the patient becomes much distorted. On examining the bones after death, they are found light, soft, and gritty to the feel; exceedingly brittle, and of a reddish brown color. Cavities of various sizes, and of a round or oval shape, are also found, usually filled with an oily, reddish, grumous fluid, but sometimes with clear serum. The red, grumous matter exhibits a cell development, and Solly regards it as a subsequent morbid product, and not simply altered fatty matter colored with blood. Dalrymple found caudate corpuscles in it, and regards it as malignant, in which opinion others agree. Virchow, however, considers that the peculiar cellular condition results from retrograde conversion of osseous into medullary substance. Paget regards mollities ossium as including two diseases—one more common in England, attended with fatty degeneration, and another called *osteoporisis* by the Germans, in which there is simply removal of earthy matter, and more common in Germany and France. He also believes the English affection generally attacks the bones of the extremities, while that form more often seen on the continent attacks the bones of the trunk. The cause of mollities ossium is rather obscure, but is frequently connected with rheumatic symptoms. In some cases a connection has been traced to syphilis. The physiological conditions which accompany it are those of mal-nutrition generally, abnormal digestion, assimilation, and disassimilation. It is a disease of adults, rarely attacking persons under 20 years of age, and the aged are also not exempt. Its subjects are more often females than males, and, in a majority of cases, it is connected with the child-bearing state. Of 131 cases collected by Litzmann of Kiel, there were 85 females in whom the disease occurred during pregnancy, or was modified by it. Of the remaining cases 46 were females and 11 were males. According to the same authority, the seat of the disease varies as it occurs within the child-bearing period or not. In the 85 child-bearing women the whole skeleton was affected in 6 cases only, and all the bones except those of the head in two; whilst in the 46 other cases not connected with the child-bearing period, all parts of the skeleton were diseased in 21, and all the bones except those of the head in 6. The urine always contains large quantities of earthy matter, chiefly phosphate of lime, which has been absorbed from the bony tissue and eliminated by the kidneys. The pelvis, or chamber of the kidney, is sometimes filled with phosphatic accretions, forming a solid calculus. At the commencement of the disease the diagnosis is very difficult, as the symptoms simulate those of rheumatism. It is important, however, to make the distinction as soon as possible, which may be done as soon as the phosphatic condition of the urine is manifested. It is readily distinguished from rickets, as the latter is peculiarly a disease of childhood, and has no tendency to spontaneous fracture of the bones. The treatment offers little encouragement, although judiciously selected tonics will sometimes afford temporary relief, and arrest for a short time the progress of the disease; but its tendency is progressive. In the latter stages opiates are indicated to relieve pain and produce sleep, and, with wine or other stimulants, are the only medicines required.

MOLLUS'CA, one of the great animal sub-kingdoms, including so wide a range of distinct forms that it is difficult to frame a definition that shall be applicable to all of them. The lowest forms, termed polyzoa (q.v.) or bryozoa, present so strong a resemblance to zoophytes, that until recently they were associated with the latter; whilst, on the other hand, in some of the most highly organized of this sub-kingdom, the cephalopoda, there is a decided approximation towards the vertebrated series, as is shown by the presence of a rudimentary cartilaginous skeleton, and by a peculiarity in the development of the embryo. The bilateral symmetry of external form which is almost universal in articulated and vertebrated animals, is here seldom met with; and taking them as a whole, the mollusca are characterized by the absence rather than by the presence of any definite form. The bodies of these animals are always of a soft consistence—a property to which they owe their name, which was devised for them by Cuvier, before whose time they were included in the *Vermes* of Linnæus's arrangement. The *shell*, when it exists, is not to be regarded as an exo-skeleton giving attachment to muscles, and regulating the form of the animal, but merely as an appendage designed for the protection of the body from which it derives its shape; indeed, it is only where the body is uncovered by a shell, or where the locomotive organs can be projected beyond it, that any active movements can be effected. The whole fabric is inclosed in a thick, soft, flexible skin, called the *mantle*, and it is on the surface of this envelope that the shell is formed by the development and subsequent calcification of epithelial cells. In many of the mollusca the shell is composed of a single piece, which is usually a spiral tube, closed at one end, and gradually increasing in size towards the open extremity, from which the animal is able to protrude itself. Shells of this description are called *univalves*. In others, the shell is composed of two pieces or valves, attached to each other at one point by a hinge, which is furnished with an elastic ligament that serves to open the valves, when it is not opposed by the action of the *adductor* muscles, whose office it is to keep the shell closed. Shells of this kind are termed *bivalves*. These differences in the character of the shell correspond with differences in the conformation of the animals inhabiting them. The

Mollusks.—1. Dendronotus. 2. Elysia. 3. Hyalea. 4. Clio. 5. Terebratulina. 6. Duck-muscle. 7. Spirifer. 8. Pentamerus. 9. Terebratula. 10. Ship-worm. 11. Mud-muscle. 12. Stone-piercer. 13. Brown muscle, or piddock. 14. Venus-shell. 15. Cuttle-fish. 16. Painter's-shell. 17. Ham-shell. 18. Pearl-oyster. 19. Inner surface of pearl oyster. 20. Conical snail. 21. Spondylus. 22. Oyster. 23. Exogyera. 24. Horned snail. 25. Nautilus.

bivalve mollusca exhibit no traces of a head, and hence are termed *acephalous* mollusca; while the univalves have a distinct head, provided with organs of the special senses, and hence, by way of distinction, some writers have termed them *cephalophora* (or head-bearing). Many mollusca are altogether unprovided with a shell, or have only a small calcareous plate embedded within the mantle. These are termed *naked* mollusca. It is worthy of notice that the young mollusc, while still in the egg, is almost always furnished with a delicate pellucid shell, even when it is ultimately to be naked, in which case the embryonic shell is cast off soon after the animal makes its escape from the egg. For the mode of formation, etc., of the shell, see SHELL.

The movements of many of the mollusca are executed by means of a muscular structure concentrated in some particular part or parts of the mantle, and termed the *foot*. In some (the gasteropoda), the foot forms a sort of flattened disk, by the alternate contraction and expansion of different parts by which the animal can slowly crawl forwards; whilst in others (the free-moving bivalves) it is a tongue-like organ, which can be protruded between the valves, and by its sudden extension, after being previously bent upon itself, can enable its possessor (the common cockle, for example) to take considerable leaps. The foot is also the agent by means of which certain species burrow in the sand or mud, and others bore into the solid rock. Many mollusca, however, are firmly attached to a single spot, except during their larval state; and as they do not require a foot, we find it either altogether undeveloped (as in the oyster), or serving to support a glandular organ, from which filaments of silky or horny matter (called the *byssus*) are secreted, which serve to attach the animal (the common mussel, for example) to rocks, stones, etc., beneath the water. Many of the subdivisions of the mollusca present modes of locomotion altogether independent of a foot, as, for example, the *biphora*, which are described in the article TUNICATA; those bivalves which possess a branchial or respiratory chamber, into which water is drawn, and again expelled by muscular action, a recoil being thus produced which serves to drive the animal through the water; the *pteropoda* (q.v.), which are furnished with a pair of broad flattened fins (which may possibly be regarded as a modified foot) at the sides of the head, by means of which they swim with tolerable rapidity; and the *cephalopoda*, in which the mouth is surrounded by a number of arms, which serve not only as organs of motion, but for the capture of prey.

The *nervous system* in the mollusca is developed in accordance with two distinct types. In the lowest group of this sub-kingdom (the molluscoids), there is only a single ganglion with afferent and efferent fibers radiating in every direction; while in the higher groups there are several ganglia lying somewhat irregularly in different parts of the body, and communicating by nervous threads with a larger mass placed in the head, or in the neighborhood of the œsophagus. This mass consists of several ganglia, which from their position are termed *supraœsophageal*, and is united by filaments with other ganglia lying below the œsophagus, so as to form a ring or collar around that organ. The supraœsophageal ganglia furnish the nerves to the special organs of the senses. Most of the mollusca possess special *organs of touch* in the form of lips or of special lobes around the mouth; of tentacles or arms upon the head, or of cirrhi upon other parts of the body; and in addition to these special organs, the skin appears to possess considerable sensibility. When tentacles are present, they are either two or four in number; and they can be protruded and retracted at pleasure, as every one must have noticed in the case of these organs (popularly known as *horns*) in the snail. *Organs of sight* are not universally present. In many mollusca there is only a single rudimentary eye, while in others there is a large number of imperfect eyes (termed *ocelli*), which do not of necessity lie in the region of the head. In the higher mollusca there are two eyes, sometimes placed directly on the head, and sometimes on the tentacles; and in the highest group (the cephalopods) the eyes are as fully developed as in fishes.

Organs of hearing, in a simple form, are almost always present. They usually consist of round vesicles in the neighborhood of the œsophageal ring, from which they receive a nervous filament. They contain a clear fluid and a small concretion of carbonate of lime, which is sometimes roundish, and sometimes of a crystalline form, and is in a perpetual state of vibration, in consequence of ciliary action in the interior of the vesicle. Whether there are any special *organs of smell* and *taste* in the mollusca is still undecided.

The organs of *vegetative* life (of digestion, circulation, etc.) are much more fully developed in the mollusca than those of *animal* life. The alimentary canal, which presents almost every variety of form from a simple cavity to a complicated intestine, is always provided with two distinct openings, a mouth and an anus, the latter being often situated (as in the gasteropoda and pteropoda) on the right side of the anterior part of the body. The liver is always present, existing in a mere rudimentary form in the polyzoa, constituting a large part of the body in the acephalous bivalve mollusca (as the mussel and cockle), and a still larger part in the gasteropoda (as the snail), while in the cephalopoda it is constructed upon nearly the same plan as in fishes. Other secreting organs, such as salivary glands, pancreas, and urinary organs, are also present in the more highly developed mollusca.

The circulation of the blood is effected (except in the polyzoa) by means of a distinct heart, which usually communicates with a regular, closed vascular system: but in some cases the venous system is imperfect, and the blood which has been transmitted by the

arteries to the system in general is not confined within distinct vessels, but meanders through sinuses or passages excavated in the tissues, and through them it reaches the respiratory apparatus, whence it is transmitted by closed vessels (veins) to the heart. The blood is nearly colorless (sometimes of light blue or green tint), and contains but few floating corpuscles. In all but the very lowest mollusca there is a distinct respiratory apparatus, which, excepting in the case of the terrestrial gasteropoda (as, for example, the snail), is constructed with a view to aquatic respiration, and is composed of *branchiæ*, or gills. These branchiæ usually consist of a series of membranous plates (arranged like the leaves of a book or the teeth of a comb), over which the water flows. They are sometimes attached to the surface of the body, but are most commonly inclosed within the mantle, or placed in a cavity in its interior called the branchial or respiratory chamber. In many of the bivalves, the openings for the ingress and egress of water are prolonged into tubes or syphons, which are sometimes of considerable length; the tube through which the water enters being termed the *oral* syphon, while that through which it escapes is termed the *anal* syphon. In all the aquatic mollusca except the cephalopoda, the renewal of the water in contact with the surface of the gills is mainly due to ciliary action. In the air-breathing gasteropodous mollusca (of which the snails and slugs are well-known examples), there is a pulmonary sac or bag into which the air penetrates by an opening on the right side of the body near the neck.

There are considerable differences in the modes of *propagation* of the mollusca. In the molluscoids—the polyzoa and tunicata—there is both propagation by gemmation (like that of zoophytes, q.v.) and sexual reproduction, the sexes being distinct in the polyzoa, and united in the same individual (constituting hermaphroditism, q.v.) in the tunicata. In the lamellibranchiata, or bivalve mollusca, and in the cephalopoda, the sexes are separate; while in the gasteropoda the sexes are most commonly separate, although a considerable number are hermaphrodites, which, however, require mutual impregnation to fertilize the ova. The eggs vary greatly in form; in some cases they are laid separately, but most commonly they are agglutinated together in a mass, while in some marine species many eggs are inclosed in a leathery capsule, while numerous capsules are united to form a large mass. A comparatively few mollusca produce living offspring, the ova being retained in the oviduct until the extrusion of the young animals.

The mollusca are widely diffused through time and space. They were amongst the earliest animal inhabitants of our globe, and are everywhere found in fresh and salt water (except at great depths), and in every latitude of the earth. The great majority are marine animals, and it is in the tropical regions that the largest and most beautiful forms are developed. It is impossible to form even an approximate estimate of the number of mollusca. According to Leunis (*Synopsis der drei Naturreiche; erster Theil*, 1860, p. 77), there are 16,732 living, and 4,590 fossil species, exclusive of polyzoa; and it is probable that only a small proportion of the naked or shell-less mollusca is yet known.

The uses of many species of mollusca for food are too well known to require notice, and as bait for fishing, mussels and some other mollusca are of great value.

The animals of this sub-kingdom are divisible into the *molluscoids* and the true *mollusca*, the former being distinguished from the latter by the very low development of the nervous system, which is composed of only a single ganglion, giving off nerves in different directions, and by their propagating by gemmation. The molluscoids are divisible into: Class 1. Polyzoa or Bryozoa. Examples—*Plumatella, Flustra.* Class 2. Tunicata. Examples—*Ascidia, Salpa.* The true mollusca are divisible into: Class 3. Brachiopoda or Palliobranchiata. Example—*Terebratula.* Class 4. Lamellibranchiata. Examples—*Oyster, Mussel, Cockle.* Class 5. Gasteropoda. Examples—*Snail, Cowry, Limpet, Doris.* Class 6. Pteropoda. Examples—*Clio, Hyalea.* Class 7. Cephalopoda. Examples—*Cuttle-fish, Nautilus.* The distinctive characters of these classes are given in separate articles.

The literature of this subject is very extensive. Amongst the most important works on the mollusca generally may be mentioned Cuvier, *Mémoires pour servir à l'Histoire et à l'Anatomie des Mollusques avec* 35 *pl.* (Paris, 1817, 4to); Lamarck, *Hist. Nat. des Animaux sans Vertèbres*, 2d edit., par Deshayes et Milne-Edwards (11 vols. 8vo); Woodward, *Manual of the Mollusca;* and the third volume of Bronn's great work, published at Leipsic in 1864, entitled *Classen und Ordnungen des Thierreichs;* while for information on the mollusca of Great Britain, the reader is especially referred to Forbes and Hanley, *Molluscous Animals and their Shells* (4 vols. 8vo); Gosse, *A Manual of Marine Zoology for the British Isles;* and Alder and Hancock, *Nudibranchiate Mollusca* (published by the Ray society).

Fossil Mollusca.—The hard shells of most Mollusca fit them for long preservation, and make them the most frequent organic remains in the fossiliferous rocks from the Silurian upwards. The tunicata and the nudibranchiate gasteropods, having no hard parts that could be preserved, are without fossil representatives; the glassy and translucent fragile shell of the pteropoda is only known fossil from a few species in the tertiary strata; unless, indeed, the comparatively large forms (*connalaria* and *theca*) from the older rocks have been rightly referred to this order, The remaining four orders—the cephalopoda, gasteropoda, brachiopoda, and lamellibranchiata—have existed together from the earliest

period. The tetrabranchiate cephalopoda were developed in great profusion and variety in the paleozoic and secondary periods; and as they decreased, the dibranchiate group took their place, and continued to increase in numbers until it reached its greatest development in the seas of our own day. Of the chambered shells like the pearly nautilus, it is estimated that over 1400 species are known, of which only five or six exist in the ocean now; the cuttle-fishes and squids, on the other hand, are represented in the secondary and Tertiary rocks by about 100 species, while at least twice as many are known as living species.

The living gasteropoda exceed the fossil in the proportion of 4 to 3. This disproportion will appear greater when we remember that the fauna of the present seas is set against the faunas of some thirty different periods, yet it must not be forgotten that we can never be acquainted with more than a fraction of the entire animal life of any bypast age. Almost contemporaneous with the first living organisms, this group has gone on increasing to the present time, when the numbers are so great that more than 8,000 living species have been recorded. A genus of air-breathing univalves has been described by Lyell, from the coal-measures of Nova Scotia. A single species—a modern-looking *physa*—has been obtained from the Purbeck limestone, the newest of the secondary rocks. They are more frequent in tertiary beds.

The brachiopoda, or lamp-shells, like the nautilus group, have their history chiefly written in the rocky tablets of the earth. Of 1300 known species, only 75 are living, and these are comparatively rare, or are at least found in inaccessible localities, whereas, in some periods of the earth's history, as when the chalk and mountain limestone beds were being formed, and especially during the Devonian period, the individuals abounded to an enormous extent. The genus *lingula*, seven species of which live in the modern seas, can be traced through the intervening strata, down to the first fossiliferous bed, to which, indeed, it gives the name of "lingula bed;" but this species, though externally not to be distinguished from the existing shell, has a pedicel groove in the ventral valve—a character sufficient, perhaps, for the establishment of a different genus. Indeed, none of the genera of the paleozoic rocks still exist; the want of exact information is the only excuse for the continued application of the names of recent genera to the ancient inhabitants of the globe.

The conchifera have been gradually increasing in numbers and importance from the earliest period, and they attain their maximum development in the existing seas. The more simple forms, with an open mantle, are common in the paleozoic strata; the siphonated families, unknown in the older rocks, appear in considerable number in the secondary strata, and continue to increase upwards. The recent species number about 3,000, while the fossil are nearly twice as many.

MOLLUSCOIDA, a division of the sub-kingdom Mollusca (q. v.), also in the article INVERTEBRATE ANIMALS.

MOLL'WITZ, a village of Prussian Silesia, in the government of Breslau, seven m. w. of Brieg. Pop. 619. To the e. of it lies the celebrated battle-field where Frederick II. of Prussia gained his first victory over the Austrains under marshal Neipperg, April 10, 1741. According to the usual account, Frederick, on seeing his right wing and center thrown into confusion and routed, put spurs to his charger, and fled from the field; but the advance of three battalions of Prussian infantry stopped the Austrians, while by this time marshal Schwerin, who commanded on the Prussian left, routed the Austrian right wing, and compelled the whole to retreat. The Austrians suffered immense loss in killed, wounded, and prisoners. The immediate result of this victory was an alliance between France and Prussia, to dissolve which Austria was compelled to surrender the province of Silesia to Frederick, in 1742.

MOLLY MAGUIRES, a secret order which existed in 1854–77, and probably still exists, in the anthracite coal mining region of north-eastern Pennsylvania. Here 400 collieries employed 60,000 men; Americans, Germans, Welshmen, Englishmen, and Swedes comprising one-half the number, the remainder being Irish. Among the latter half originated, in the locality named, the order of Molly Maguires, a branch of the "ribbonmen" of Ireland. The order, however, had a much wider existence, and is alleged to have been affiliated with the "ancient order of Hibernians," elsewhere a peaceable and reputable organization. Until 1865 and '66 the order of Molly Maguires had not become generally known for the murders and other brutalities which then distinguished it. In 1875, having gained control of a combination which forced a general strike in the coal-regions, it succeeded in obtaining an ascendency in the councils of the miners, and from that period was prominent in assassinations and other outrages, committed usually on the persons and against the property of justices of the peace, police officers, and mining bosses. The number of murders increased between 1869 and '71, and fell off after the latter year, and until that of the great strike of 1875. According to some of those who made an investigation into the antecedents of the Molly Maguires, they originated in the trade-unions, and not in the A. O. H. or among the ribbonmen. None but Catholic Irishmen or their descendants were admitted to membership: the order was organized in divisions, each having a chief official known as a "body-master;" and there were signs and passwords to enable members to distinguish each other. These signs and passwords were given to the members by the body-masters, who received

them from the county delegate, who got them from the state delegate, to whom they were furnished by the national delegate or national board in New York city: to the latter they came quarterly from Ireland, by the hands of the steward of one of the transatlantic steamships. A central and governing organization known as "The Board of Erin" was said to be the origination of the order, and this held quarterly meetings in England, Scotland, or Ireland. So extended were the ramifications of this order in Pennsylvania, that it was made known during the trials of the Molly Maguires in 1877 that one of their body-masters in the Pottsville district held the high office of county commissioner. The final exposure, capture, and punishment of the Molly Maguires was largely due to the energy and determination of Franklin B. Gowen, president of the Philadelphia and Reading railroad co. and coal co.; through the immediate instrumentality of James McParlan, a detective, who joined the Molly Maguires, became acquainted with their members and the secrets of their organization, and was at length enabled to afford information which disclosed the names of criminals connected with a majority of the murders committed by the order. A large number were apprehended, tried, and condemned, and their execution—that of a number of them occurring on the same day—so alarmed the members of the order that it ceased to possess any extended influence.

MOLO, a city of the Philippine islands, on an island of the same name, 4 m. from Iloilo. See PHILLIPINES. In ancient times, it was a Chinese colony, and is now occupied by Mestizos and their descendants, most of them having a mixture of Chinese blood. Pop. 16,000.

MOLOCH (more correctly MOLECH), also MILKOM, MALKOM (*their* king), from Heb. *Melech*, king, the chief Ammonite deity (the Chemosh of the Moabites), whose worship consisted chiefly of human sacrifices, purifications, and ordeals by fire, mutilation, perpetual virginity, and the like; practices specially inveighed against in the Mosaic records. Even the stranger who should devote his offspring to this idol was to be put to death by stoning. It is not quite certain which was the particular manner of this sacrifice. Rabbinical tradition represents Moloch as a human figure of brass or clay, with a crowned bull's head, upon whose extended arms were laid the doomed children. A fire within the hollow statue soon scorched them to death, while their shrieks of agony were deadened by a loud noise made by the priests upon various instruments. But although this description nearly coincides with that of the statue of the Carthaginian Kronos, and although so late a traveler even as Benjamin de Tudela speaks of having seen the remains of an ancient Ammonite temple at Gebal, with the fragments of an idol somewhat corresponding to the above representation, yet nothing certain is known about this point at present; nay, even the burning of the children itself has been questioned; and it is contended, yet without much show of reason, that the victims were merely carried through two pyres of fire by way of solemn purification or baptism. It seems, however, certain that the worship of Moloch, in whatever shape it may have been, was common throughout the Canaanite nations. The Carthaginians, through whom it was probably spread over the whole east, worshiped Kronos in rites of fire and bloodshed; and human beings, children or grown-up persons, prisoners or virgins, were, either on certain periodical festivals, or on sudden emergencies, offered up throughout almost all the lands and islands which the merchant-people of antiquity may be supposed to have touched at. The description of the Kronian statue, as given by classical writers, differs only in that small respect from the one given above, that the child fell, according to the former, from the hands of the god into a burning fire below, instead of being slowly burned to death. On fire worship in general, which is the main idea of "Moloch"—probably worshiped originally as the symbol of the sun—we have spoken under GUEBRES. The name itself gives no clew to its special nature, nor does any comparison with cognate roots lead any further. Molech, or Melech, is the supreme king or deity of the people, who have enthroned him as their tutelary god. Naturally, the princes of Ammon are the princes of *Malcham* = their (the Ammonites') king or god, and his priests were high in social rank.

Respecting the special history of this worship among the Israelites, we can only say that, although we do not see any more reason to presuppose its wide spread at early times (on account of the frequent occurrence of the word "king" in doubtful passages) than there is the slightest ground for assuming (as has been done by Daumer and others) that the whole Mosaic religion originated in a Moloch-service (a notion which hardly required a serious refutation for its instant explosion), yet there is no doubt that it had its secret, although few adherents, even before the Canaanite women in Solomon's harem reintroduced it publicly. The Valley of Hinnom and the Mount of Olives were the chief places of these abominable rites; the former being afterwards adopted as the name for hell, even in Islam. Not until the time of Josiah was it rooted out from among the people. The word has now become a designation for a kind of irresistible dread influence, at whose shrine everything would be sacrificed, even as the deluded father offered his own child to the terrible idol.

MO'LOCH, a genus of saurian reptiles, of the family *Agamidæ* (see AGAMA). *M. horridus*, an Australian species, is perhaps the most ugly and repulsive in appearance of all the saurian tribes. The whole surface of the body is covered with irregular plates and strong sharp spines; the upper surface of the head is crowned with two very large spines;

and on the back of the neck are large rounded protuberances, covered with granular scales and spines. The moloch is, however, a perfectly inoffensive creature.

MOLO'GA, a district t. in the w. of the government of Jaroslav, in European Russia, is situated near the confluence of the Mologa and Volga, 68 m. w.n.w. of Jaroslav. It is a town of great antiquity, and first belonged to the principality of Rostof, afterwards to Yaroslaf, but from 1321 till 1471 it had its own princes. There was formerly an extensive fair at Mologa. The timber-trade, and the carriage of goods by river-boats and rafts, now occupy the majority of the inhabitants. Pop. '67, 3,715.—The river Mologa is one of the links between the Volga and the Neva.

MOLOSSIA, or Molossis, a division of ancient Epirus, comprising the n.e. district. Its chief town was Ambracia. The country was famous, in ancient times, for its breed of shepherd dogs.

MOLOSSUS, a genus of bats (cheiroptera). The head and ears are large; hind limbs robust, giving the animal more power of running than most others of the order; tail long, enveloped at its base, but most frequently free at the extremity. It has a wide geographical distribution, in Africa, Asia, and South America, principally the two latter, in warm regions. Dental formula:

$$i\,\frac{1-1}{1-1};\ c\,\frac{1-1}{1-1};\ m\,\frac{5-5}{5-5}=28$$

MOLTKE, Hellmuth, Count von, Field-marshal of the German empire, and chief of the general staff, who planned the Prussian campaign of 1866 against Austria, and the German campaign of 1870–71 against France. He belongs to an old family who had their seat for centuries in Mecklenburg, where Moltke was born, Oct. 26, 1800. Soon after his birth, his father, a military officer, left Mecklenburg and acquired an estate in Holstein. He and his brother were sent to the military academy in Copenhagen, where iron discipline and military frugality laid the foundation of his later character. In 1822 he entered the Prussian army as cornet. His parents having by this time lost all their fortune, he was left without any means whatever, and had to undergo many hardships to maintain himself in his position, from the very modest pay the Prussian officers receive; yet he managed to save enough to take lessons in modern languages, which afterward proved of great advantage to him. His eminent abilities soon procured him a place in the general staff. The time between 1835 and 1839 he spent in Turkey and Asia Minor, whither he was sent by the Prussian government to report on the war between that country and Mehemet Ali. Several anonymous publications of his, descriptive of the country and the war, are worthy of notice. After his return, he rapidly advanced through the different stages to the rank of general, continuing, however, on the general staff. His wonderful strategical powers were of immense service in the wars with Denmark (1863–64), Austria (1866), and France (1870–71); bringing them all to triumphant issues. At the end of the Austrian war he was rewarded with the order of the Black-Eagle, in 1870 he was created a count, and in 1871 he was raised to the rank of field-marshal. He published a work on the Franco-German war. Moltke is a man of great modesty and simplicity; he is reserved, and so little given to talk, that he has acquired the surname of "the Silent." The same composure and equanimity that he possesses in council, he also preserves in the heat of battle. See Germany.

MOLUC'CAS, or Royal Islands, properly so called are Ternate, Tidore, Makian, Motir, and Batjan, lying to the w. of Gilolo, and washed by the Moluccas strait or passage, which separates Gilolo from Celebes.—Ternate, the most important, is a volcanic mountain with plains at its base. The top is in 0° 48′ 30″ n. lat., and 127° 26′ 30″ e. long. Area 33½ sq. miles. Pop. 8,594, of whom 109 are Europeans. The town is on the e. side and contains the sultan's palace, the Dutch residency, Protestant church, government school, etc. The island is fertile and well watered; the natives peaceful. They cultivate rice, cotton, tobacco, etc., trade with the adjacent islands, and build vessels, from the light skiff and the tent-boat to the war-galley of 60 or 80 rowers, carrying two or more pieces of light artillery.—Tidore is s. of Ternate, its n. point being 1° 11′ n. lat., and 127° 7′ e. long. Area 33 sq. miles. Pop. 8,157. The island is a volcano, 5,532 ft. high, and fertile for 3,000 feet. The natives are less gentle but more industrious than those of Ternate, and diligently cultivate the soil, weave, and fish. They are Mohammedans, and have many mosques. The sultans of Ternate and Tidore are subsidized by and subject to the Netherlands, exercising their authority under the surveillance of the resident.—Makian lies in 0° 18′ 30″ n. lat., and 127° 24′ e. long., is very fertile, yields much sago, rice, tobacco, canary-oil, etc., and has important fishings. Pop. 5,000. The natives are industrious, make good nets, spin yarns, and weave coarse striped fabrics. Further n., in 0° 28′ n. lat., and 127° 29′ 30″ e. long., is Motir, which formerly yielded a considerable quantity of cloves, and later sent much earthenware to all the Spice islands.

Batjan, the only remaining Royal island, lies between 0° 13′ to 0° 55′ s. lat., and 127° 22′ to 128° e. long., is 50 m. in length, and 18 in breadth, has many mountain peaks from 1500 to 4,000 ft. in height, the sources of numerous rivers. The greatest part of

this beautiful island is covered with ebony, satin-wood, and other valuable timber trees, which give shelter to numerous beautiful-plumaged birds, deer, wild hogs, and reptiles. Sago, rice, cocoa-nuts, cloves, fish, and fowls are plentiful, and a little coffee is cultivated. Coal is abundant, gold and copper in small quantities. The inhabitants, 1800, who are lazy and sensual, are a mixed race of Portuguese, Spaniards, Dutch, and natives. These islands are all volcanic, Ternate being a mountain, sloping upwards to 5,563 ft., to which Tidore bears a striking resemblance. Makian is an active volcano, which, so late as Dec., 1861, threw forth immense quantities of lava and ashes, by which 326 lives were lost, and 15 villages in part or in whole destroyed. Motir is a trachyte mountain, 2,296 ft. in height; and Batjan, a chain with several lofty peaks. Total population of the Moluccas proper, 23,551.

To the s.w. of Batjan lie the Obi group, consisting of Obi Major, Obi Minor, Typha, Gonoma, Pisang, and Maya, of which Obi Major, in 1° 25′ s. lat., and from 127° to 128° e. long., is by far the largest, having an area of 598 sq. miles. It is hilly and fertile, being covered, like the smaller islands of the group, with sago and nutmeg trees. They are uninhabited, and serve as lurking-places for pirates and escaped convicts. In 1671 the Dutch built a block-house, called the Bril; and a few years later the sultan of Batjan sold the group to them for $800; but the station being found unhealthy, the company abandoned it in 1738.

The Moluccas, or Spice Islands, in the broad use of the term, lie to the e. of Celebes, scattered over nearly 11 degrees of lat. and long., between 3° s. to 8° n. lat., and 126° to 135° e. long., including all the territories formerly ruled over by the sultans of Ternate and Tidore. They are divided into the residencies of Amboyna (q.v.), Banda (q.v.), and Ternate; a fourth residency being Menado (q.v.). Over the northern groups of the Spice islands the Netherlands exercise an indirect government, the sultans of Ternate and Tidore requiring to have all their appointments of native officials ratified by the resident. The southern groups are directly under European rule. The residency of Amboyna contains that island, sometimes called Ley-Timor, or Hitu, from the two peninsulas of which it is formed, Buru, the Uliasser group, and the w. part of Ceram. That of Banda includes the Banda, Kefling, Key, Arru, and other islands, also the eastern portion of Ceram. Under the residency of Ternate are placed the Moluccas proper, Gilolo, the neighboring islands, and the n.w. of Papua. In 1881, pop. of the Moluccas and dependencies, 5,000 Europeans and 800,000 natives.

Amboyna, the Banda and Uliasser islands, chiefly supply the cloves, nutmegs, and mace which form the staple exports. The Banda islands are Neira or Banda-Neira, Great Banda, Ay or Way, Rhun, Rozingain, and Goenong-Api, containing an area of 588 sq. miles. In 1857, pop. 6,101, of whom 400 were Europeans; that of the whole residency, 110,302, including the eastern part of Ceram. The principal island of the group is Neira, s.e. from Amboyna, in 4° 33′ s. lat., and 130° e. long., separated by narrow straits from Goenong-Api on the w. and Great Banda on the east. The coast is steep, and surmounted by several forts and batteries, which command the straits and roadstead. The town of Neira, on the s. side of the island, is the capital of the Dutch residency of Banda, has a Protestant church, school, and hospital. The Banda islands have a rich soil, and are planted with nutmeg-trees, producing, in 1860, upwards of a million lbs. of nuts, and 275,586 lbs. of mace. The culture has nearly doubled since 1851. Pine-apples, the vine, banana, cocoa-nut, and other fruit-trees thrive, and are abundant. Ay is the prettiest and most productive of the group. Goenong-Api is a lofty volcano. There are wild cows, hogs, and deer; sea-carp and mackerel, which last are dried, and form with sago the food of the slaves. The e. monsoon begins in May, and the w. in December, and are accompanied with rain and storms. The climate is not particularly healthy.

The Uliassers, which, with Amboyna, produce the cloves of commerce, are Saparoua, Oma or Haroukou, and Nousa-Laut. They lie to the e. of Amboyna, in 3° 40′ s. lat., and 128° 33′ e. long., and have an area of 107½ sq. miles. Saparoua is the largest, and is formed of two mountainous peninsulas, joined in the middle by a narrow strip of undulating grassy land. Recently there were about 100,000 trees, producing 185,000 lbs. of cloves. The pop. amounts to 11,665, of whom 7,340 are Christians, and have 12 schools, with a very large attendance of scholars.—Oma, separated from Saparoua by a strait of a league in width, has 11 villages, of which Harouka and Oma are the chief. It is mountainous in the s., and has several rivers and sulphurous springs. The produce of cloves has amounted in one year to 40,000 lbs.; and the villagers possess 50,000 cocoa palms, besides other fruit-trees. The woods abound with deer and wild hogs, the rivers with fish. Sago is grown, but not in sufficient quantities to meet the wants of the people, who draw further supplies from Ceram. The beautiful village of Harouka, on the w. coast, is the residence of the Dutch postholder, who is president of the council of chiefs. Here is the head office of the clove-produce. There are two forts on Oma, several churches, and 6 schools, with 700 pupils. Pop. 7,188, one-half Christians, the other Mohammedans.—Nousa-Laut lies to the s.e. of Saparoua. It is planted with clove-trees, which in one year produced 120,000 lbs. There are upwards of 30,000 cocoa-nut trees. The inhabitants, who formerly were pirates and cannibals, amount to 3,479 souls, are all Christians, and have schools in every village—in 1859 they were attended by 870 pupils.

The clove-tree and the nutmeg are indigenous to all the Spice islands, but the clove-cultivation is confined to Amboyna and the Uliassers, the nutmeg to the Banda islands. Till 1824 the Dutch prohibited the planting of these trees in other parts, and caused those of native growth to be rooted out, in order to prevent smuggling, and to retain the supply of these spices to the European market. The Spice islands are generally healthy both for Europeans and Asiatics; and though the plains are sometimes very hot, mountains are always near, where it is pleasantly cool in the mornings and evenings. Besides the spice-trees, the bread-fruit, sago, cocoa-nut, banana, orange, guava, papaw, also ebony, iron-wood, and other valuable timber-trees, are abundant. The natives of some of the islands are Alfoers; of others, Malays on the coasts, and Alfoers in the interior. In Ceram are also Papuan negroes, brought originally from Bali and Papua as slaves.

The resident and other Dutch officials reside in the city of Amboyna, the streets of which are broad, planted with rows of beautiful trees, and cut each other at right angles. There are two Protestant churches, a town-house, orphanage, hospital, and theater, besides a useful institution for training native teachers, with which is connected a printing-press. Near the city are beautiful promenades and country-seats. Pop. 10,500.

In 1854 the clove-produce amounted to 580,592 lbs., the number of trees planted being 405,639, of which one-third part were fruit-bearing; nutmegs, 537,861 lbs., and mace, 133,986 lbs.; the trees planted being 424,573, of which 297,272 were bearing. The total cost of the nutmegs and mace delivered in the Netherlands that year was £30,768 sterling, realizing £94,466. In 1859 the Moluccas sent to Java for the account of government, 2,012 piculs of mace (the picul = 133 lbs.), 81,101 of cloves, 6,636 of nutmegs, and 28 of cocoa-nut soap; the value being £59,416. The produce of nutmegs, in 1851, was 463,309 lbs.; in 1859 it had risen to 832,634, and in 1860 to 1,044,657. The clove-crop varies much, as the following table will show: 1856, 617,250 lbs.; 1857, 187,093½; 1858, 233,518; 1859, 390,888; 1860, 258,117. Amboyna and Banda have been free ports since 1854; but as government monopolizes the labor, there is no fair competition, and the people are slaves of the soil, their chiefs being paid in proportion to the produce delivered.

In 1521 Antonio de Brito first appeared to take possession of the Moluccas in the name of the king of Portugal; and after a long period of violence, intrigue, and perfidy, the Portuguese were driven out by the Dutch and natives, at the beginning of the 17th century. The change was of no advantage to the natives, for the Dutch, having obtained the exclusive right of buying all the cloves, at a nominal value, a series of wars ensued, which resulted in the subjugation of the Spice islands. Recently, new sultans of Ternate and Tidore have been appointed, with less power than their predecessors; and the wars with the Alfoers of Ceram, in 1859 and 1860, have brought them more fully under Dutch rule.

MOLY, a fabulous plant, said to be a panacea for all diseases, given by Hermes to Odysseus as a protection against the magical charms of Circe. It was supposed to be a variety of garlic. There is a kind of garlic still called "sorcerer's garlic," probably a reminiscence of the Circe legend.

MOLYBDE'NUM (sym. Mo; equiv. 48—new system, 96; sp. grav. 8.62) is a rare metal, which, in a state of purity, is of a silvery white color, has a strongly metallic luster, is brittle, and very difficult of fusion. It never occurs native, and its principal ore is the bisulphide, which much resembles graphite. It is also occasionally found oxidized, in molybdate of lead. The metal may be obtained by roasting the bisulphide in a free current of air, when the sulphur goes off oxidized as sulphurous acid, and the molybdenum is also oxidized into molybdic acid (MoO_3), and remains in the vessel. By the action of charcoal, the reduced metal is then obtained from the acid.

Molybdenum forms three compounds with oxygen—the protoxide (MoO), the binoxide (MoO_2), and molybdic acid (MoO_3). Of these three, the last alone has any practical value. Molybdic acid is a white, glistening, crystalline powder, which is almost insoluble in water, fuses at a red heat, and unites with bases to form well-marked salts, the molybdates, which are either colorless or yellow. A solution of molybdate of ammonia is one of the most delicate tests for phosphoric acid.

Molybdenum forms various compounds with sulphur, chlorine, etc., none of which are of any practical importance, except the native bisulphide.

MOLYNEUX, WILLIAM, LL.D., 1656–98; b. Ireland; educated at Trinity college, Dublin, and afterwards a member of the middle temple, London. He had been instructed in mathematics by his father, Samuel Molyneux, who had written a work on gunnery, and he soon turned his attention from law to mathematics and optics. He was one of the founders and the first secretary of the Dublin philosophical society. Two years later he was made a member of the London royal society, and was sent by the English government to examine the fortifications in the Netherlands. In 1688 he was forced to leave Ireland on account of the political troubles there, but he came back after the battle of the Boyne. In 1692 he represented the Dublin university in the Irish parliament. His main work, the first in English upon the subject, is a treatise on optics, called *Dioptrica*. This book was revised by Halley, who included in the appendix his theorem for finding the foci of optic-glasses. He also published a *Translation of the Six Metaphysical Dissertations of Descartes*, and numerous papers in the proceedings of the royal society. One of his

non-scientific works contains some interesting reminiscences of the war in Ireland—his *Journal of the Three Months' Campaign of his Majesty in Ireland,* 1690.

MOMBASSA, or MOMBAZ, a seaport t. of east Africa, in the territory of the sultan of Zanzibar, on a small coralline island off the coast, in the middle of an estuary formed by two small rivers, in lat. 4° 4′ s.. and long. 39° 43′ e., about 150 m. n. of Zanzibar island. The shores of the island are rocky and abrupt; and although the channel may be forded at low water, the attempt is attended with danger. The town has the usual Arab characteristics of ruin, neglect, and filth in a striking degree. The only object of interest is an extensive fort, built on a rock, cut perpendicularly, in 1596, by the Portuguese, and restored by them in 1635, as an inscription over the principal gateway indicates. It is a work of considerable pretension, with upwards of 100 guns in position, but in a ruinous condition. The inhabitants, the majority of whom are sunk in abject poverty, mostly live in wretched hovels, scattered among what remains of the once magnificent buildings. The town and island of Mombassa, as well as the surrounding district, is inhabited by the Wanika tribe. The harbor is still good, and is commodious and safe. Mombassa was visited by Vasco da Gama in 1497, when he found it to be a large and very prosperous town. It was held by the Portuguese during the greater part of the period from 1529 to 1720, when it appears to have become independent. The English held it from 1824 to 1826, when they resigned it. Since then it appears to have been possessed by the sultan of Zanzibar, and apparently is considered a place of some importance. Burton says that the inhabitants of Mombassa "are justly taxed with pride, bigotry, evil-speaking, insolence, turbulence, and treachery by other Arabs." Pop. 13,000 to 15,000.

MOMENT, of any physical agency, is its importance with reference to some special application. Thus, the moment of a force applied (perpendicularly) to a lever, is the importance of the force as regards turning the lever about its fulcrum. It is, as we know (see LEVER), proportional to the product of the force by the distance of its point of application from the fulcrum. The moment of a force about any axis (to which its direction is perpendicular) is the product of the force by its least distance from the axis; and a similar definition is laid down for moment of velocity and moment of momentum. It is easy to see (see MOMENTUM) that in any system of mutually acting bodies the moment of momentum about any axis remains constant, since the equal mutual forces measure the momentum transferred from one body to another, and the moments of these forces are in pairs equal and opposite. A particular case of this is Kepler's law, that each planet describes equal areas in equal times about the sun.

Moment of Inertia.—In the rotation of bodies round an axis, the moment of inertia is the sum of the products of each particle of the body into the square of its distance from the axis; or if M be the body, m_1, m_2, m_3, etc., the particles composing it, and r_1, r_2, r_3, etc., their corresponding distances from the axis, then the moment of inertia of M $= m_1 r_1^2 + m_2 r_2^2 + m_3 r_3^2 +$, etc.; and if a quantity, k, be found such that $Mk^2 = m_1 r_1^2 + m_2 r_2^2 + m_3 r_3^2 +$, etc., then k is called the *radius of gyration.* See CENTER OF GYRATION.

MOMENTUM, or QUANTITY OF MOTION, is defined by Newton as proportional to the mass moving, and its velocity, conjointly. If we assume unit of momentum to be that of unit of mass moving with unit of velocity, we shall evidently have, for the momentum of a mass M, moving with velocity V, the expression MV. And such is the unit generally adopted.

It is shown by experiment that, when force produces motion in any body, the momentum produced in one second is proportional to the force—and, in fact, *force is measured by the momentum it is capable of producing in unit of time.* Thus, the same force, if acting for one second on each of a number of bodies, produces in them velocities which are *inversely* as their masses. Also when, as in the case of falling bodies, the velocities produced in one second are the same in all, we conclude that the forces are *proportional* to the masses; and, in fact, this is the physical proof that the weight of a body is proportional to its mass. Again, if different forces act, each for a second, on the *same* mass, the velocities produced are proportional to the forces. All these are but different modes of statement of the experimental fact that force is proportional to the momentum it produces in unit of time; which forms a part of Newton's second law of motion.

When two masses act on each other, Newton's third law of motion (see MOTION, LAWS OF) shows that the forces they mutually exert are equal and opposite. The momenta produced by these must therefore be equal and opposite. Thus, in attraction or impact of two masses, *no momentum is lost;* since what is lost by one is gained by the other.

The momentum of a system of bodies can be resolved (as velocity is resolved) into components in any assigned directions, and the mutual forces of the system may be thus likewise resolved. Applying the previous result, we see at once that in any system of mutually acting bodies (such, for instance, as the solar system), no momentum is, on the whole, either gained or lost in any particular direction; it is merely transferred from one part of the system to another.

This fact, called the conservation of momentum, has caused great confusion in the minds of pseudo-physicists, who constantly confound it with conservation of work or energy, a totally different thing.

The momentum produced by a force in any period of time is measured by the product of the force and the *time during which it has acted*—the energy or work done by a force

is measured by the product of the force and the *space through which it has acted.* Momentum is proportional to the simple velocity of a body, and *can never, by any known process, be transformed into anything else.* Energy, when depending on velocity (see FORCE, CONSERVATION OF), is proportional to the *square* of the velocity, and is in the natural world *constantly being transformed from its actual or kinetic form to its potential form, and back again, or to some other kinetic form, such as heat, and finally must become heat.* Momentum, on the contrary, is never altered, either in kind or in amount.

In *knocking down* a wall, or in staving in the whole side of a ship, the battering-ram of the ancients (when constructed of sufficient mass, and worked by the proper number of men or animals) was probably nearly as effective as the best modern artillery. But in making a *breach* in a wall, or in punching a hole in the armor of an iron-clad, mere massive shot with low velocities (such as those of the Dahlgren guns), are comparatively ineffective, however great their momentum; while an Armstrong or Whitworth projectile, with a fraction of the momentum, but with greater velocity, and, for its size, much greater kinetic energy, effects the object with ease.

In many every-day phenomena, we see most distinctly the difference between these two affections of matter. Thus, a blow delivered from the shoulder by a *heavy* pugilist, even if it be sluggishly given, generally floors its man, without doing much other injury; but a sharp stroke administered by a light weight, while hardly disturbing the adversary's equilibrium, inflicts serious punishment.

MÔMIERS, French for maskers or comedians, is the name given in derision to a sect of evangelical Protestants of Switzerland and adjacent parts of Germany and France, who exhibited an uncommon degree of fervor in their religious services. They charged the national church with apostacy from the reformed faith especially by denying the divinity of Christ. This subjected them to opposition and restraint, so that ultimately, despairing of making progress, they went back to the church. The most distinguished man among them was the rev. Cæsar H. A. Malan, D.D., who having been brought up among Socinians continued to hold Socinian doctrines after his ordination as a minister in 1810, until in 1817, by means of friendly intercourse and discussion with Robert Haldane of Scotland and Dr. John M. Mason of New York, at that time sojourning at Geneva, he embraced evangelical doctrine, and was, 1820–1863, pastor of an independent congregation of Mômiers.

MOMMSEN, THEODOR, a distinguished writer on the history and polity of ancient Rome, was b. in 1817 at Garding, in Sleswick, where his father was a pastor in the Lutheran church. Mommsen studied first at Altona, and subsequently at the university of Kiel, where he graduated in arts in 1843. Having obtained some assistance from the academy of Berlin to defray the expenses of a prolonged course of travals, Mommsen spent three years in investigating Roman inscriptions in France and Italy, and from time to time published the result of his investigations in the annals of the archæological institute of Rome and the Herculanean academy of Naples. The political disturbances of 1848 diverted Mommsen from his favorite pursuits; and for a time he devoted himself to politics, taking upon himself the editorship of the leading Sleswick-Holstein paper, for which he wrote the leading articles in the summer of 1848. Mommsen was appointed professor of law at Leipsic, but was dismissed on account of his political opinions; was made titular professor of law at Zurich in 1852, and at Breslau in 1854; filled the chair of Roman law at Berlin, 1858–75; and in the latter year returned to Leipsic as professor of jurisprudence. In 1882 he was tried at Berlin for having slandered Prince Bismarck, but was acquitted. His attention has long been devoted to those branches of archæology and ancient history with which his name is now so honorably associated. Among his works are: *Die Unteritalischen Dialekte* (Leip. 1850); *Corpus Inscriptionum Neapolitanarum* (Leip. 1851); his monographs on *The Chronography of the Year* 354; and *Roman Coins* (Leip. 1850); the edict of Diocletian, *De Pretiis Rerum Venalium* A. 301 (Leip. 1851); *Inscriptiones Regni Neapolit.-Latinæ,* 1852; *Die Rechtsfrage Zwischen Cæsar und d. Senat,* 1857; his great work on Roman history, *Röm. Geschichte,* fifth edition, 1868–70 (ably translated into English by W. P. Dickson); *Römische Forschungen,* articles on special points of Roman antiquities (1st vol. Berlin, 1864); *Römisches Staatsrecht* (1st vol. Leip. 1871); *Die Erzählung von Caius Martius Corilanus;* and his *Digesta Justiniani Augusti* (Berlin, 1868–70). His valuable library was destroyed, 1880.

MOMOR'DICA, a genus of plants of the natural order *cucurbitaceæ,* having lateral tendrils, and the fruit splitting when ripe. *Momordica balsamina,* a native of the south of Europe and of the east, produces a curious, oblong, much-warted fruit, called the BALSAM APPLE, which, when green, is infused in oil, to form a vulnerary much esteemed in Syria and some other countries. The ripe fruit is a dangerous poison. The plant is used to form arbors.—The large, red, thorny fruit of *momordica mixta,* called *gol-kakra* in India, is there used for food.—*Momordica echinata* is called the *gooseberry gourd,* because its fruit, which is covered with bristles, is about the size and shape of a large gooseberry. The unripe fruit is used for pickling, and is sometimes to be seen in Covent Garden market.

MOMOT or MOTMOT, the common name for the different species of birds belonging to the genus *prionites* of Illiger. Some have placed the momot as a genus, and it has also been proposed as a family. Its place is, however, rather uncertain. It has been

assigned to the coraciadæ. The genus *prionites* has the following characteristics. Both mandibles slightly curved and compressed; the margins with strong denticulations; tongue long and slender, with the sides ciliated; wings short and rounded; tail long and pointed. Dr. G. R. Gray makes the momotinæ, a sub-family of the *todidæ*, consist of the genus *crypticus* (prionites of Swainson), and the genus *momotus* (prionites of Illiger, momota of Shaw, and rhamphastos of Linnæus).

MOMOTOM'BO, a volcano of the Marabios range, near lake Managua, 25 m. n.e. of Leon in Nicaragua. Its height is 7,200 ft., of which more than one-third is composed of the ashes and cinders ejected in past ages. It is still active, but has had no serious eruptions for many years. Among other traditions connected with it is one, embodied in Victor Hugo's *La Légende des Siècles*, which tells of an attempt by Spanish priests to ascend and plant the cross on its summit; they were never heard of afterwards; and the ascent remains to this day unaccomplished.

MOMPOX', a t. of the United States of Colombia, on the Magdalena, 110 m. s.e. of Cartagena. Here the Magdalena, during its periodical floods, rises 12 or 15 ft. above its usual level; and the quay and custom-house of Mompox are built unusually high, in order to provide against this emergency. All the foreign goods destined for the consumption of the valley of the Magdalena pass through this town. Pop. estimated at 10,000.

MOMUS, in fabulous history, the god of raillery, or the jester, who ridiculed both gods and men. He is the personification of mocking censure. Being requested by Vulcan, Neptune, and Minerva, to give his opinion as to their works, he blamed them all: Neptune, for not making his bull with horns before his eyes, in order to give a surer blow; Minerva, for building a house which could not be moved in case of bad neighbors; Vulcan, for making a man without a window in his breast, that his secret thoughts might be seen. Venus alone was blameless. For his free censures of the gods he was expelled from heaven. He is generally represented as raising a mask from his face, and holding a small figure in his hand. He is according to Hesiod the progeny of Night.

MON'ACHISM (Gr. *monachos*, a monk, from *monos*, alone) may in general be described as a state of religious retirement more or less complete, accompanied by contemplation, and by various devotional, ascetical, and penitential practices. It is, in truth, asceticism (q.v.), with the element of religious solitude superadded. The institution of monachism has, under different forms, entered into several religious systems, ancient and modern. That it was known among the Jews before the coming of our Lord, appears from the example of the prophet Elias, and from that of the Essenians; and it is probable that religious seclusion formed part of the practice of the Nazarites (q.v.), at least in the later periods of Jewish history. In the Brahmanical religion, it has had a prominent place; and even to the present day, the *lamaseries* of Thibet may be said to rival in number and extent the monasteries of Italy or Spain. The Christian advocates of monachism find in the gospel exhortations to voluntary poverty (Matt. xix. 21) and to celibacy (1 Cor. vii. 37), at once the justification and the origin of the primitive institution. Its first form appears in the practice of asceticism, of which we find frequent mention in the early part of the 2d century. The primitive ascetics, however, lived among the brethren, and it is only in the following century that the peculiar characteristic of monachism begins to appear. The earliest form of Christian monachism is also the most complete—that already described under the head Anchorites (q.v.); and is commonly believed to have in part originated in the persecutions, from which Christians were forced to retire into deserts and solitary places. The anchorites maintained from choice, after the cessation of the persecutions, the seclusion to which they had originally resorted as an expedient of security; and a later development of the same principle is found in the still more remarkable psychological phenomenon of the celebrated Pillar-saints (q.v.). After a time, however, the necessities of the religious life itself—as the attendance at public worship, the participation of the sacraments, the desire for mutual instruction and edification—led to modifications of the degree and of the nature of the solitude. First came the simplest form of common life, which sought to combine the personal seclusion of individuals with the common exercise of all the public duties; an aggregation of separate cells into the same district, called by the name *Laura*, with a common church, in which all assembled for prayer and public worship. From the union of the common life with personal solitude is derived the name *cenobite* (Gr. *koinos bios*, common life), by which this class of monks is distinguished from the strict solitaries, as the anchorites or eremites, and in which is involved, in addition to the obligations of poverty and chastity, which were vowed by the anchorites, a third obligation of obedience to a superior, which, in conjunction with the two former, has ever since been held to constitute the essence of the religious or monastic life. The first origin of the strictly cenobitical or monastic life has been detailed under the name of Saint Antony (q.v.), who may be regarded as its founder in the east, either by himself or by his disciples So rapid was its progress, that his first disciple, Pachomius (q.v.), lived to find himself the superior of 7,000. In the single district of Nitria, there were no fewer than 50 monasteries (Sozomen, *Eccles. History*, vi. 31), and before long, the civil authorities judged it expedient to place restrictions on their excessive multiplication. It seems to be admitted, that, in the east, where asceticism has always been held in high estimation, the example of Christian monasticism

had a powerful influence in forwarding the progress of Christianity; although it is also certain that the admiration which it excited occasionally led to its natural consequence among the members, by eliciting a spirit of pride and ostentation, and by provoking, sometimes to fanatical excesses of austerity, sometimes to hypocritical simulations of rigor. The abuses which arose, even in the early stages of monachism, are deplored by the very Fathers who are most eloquent in their praises of the institution itself. These abuses prevailed chiefly in a class of monks called *Sarabaitæ*, who lived in small communities of three or four, and sometimes led a wandering and irregular life. On the other hand, a most extraordinary picture is drawn by Theodoret, in his *Religious Histories*, of the rigor and mortification practiced in some of the greater monasteries. The monks were commonly zealots in religion; and much of the bitterness of the religious controversies of the east was due to that unrestrained zeal; and it may be added that the opinions which led to these controversies originated for the most part among the theologians of the cloisters. Most famous among these were an order called *Acœmetæ* (Gr. sleepless), from their maintaining the public services of the church day and night without interruption. See MONOPHYSITES, MONOTHELISM, NESTORIANS, IMAGE-WORSHIP.

It was in the cenobitic rather than the eremetic form that monachism was first introduced into the west, at Rome and in northern Italy by Athanasius, in Africa by St. Augustine, and afterwards in Gaul by St. Martin of Tours. Here also the institute spread rapidly under the same general forms in which it is found in the eastern church; but considerable relaxations were gradually introduced, and it was not until the thorough reformation, and, as it may be called, religious revival effected by the celebrated St. Benedict (q.v.), in the beginning of the 6th c., that western monachism assumed its peculiar and permanent form. In some of the more isolated churches, as, for instance, that of Britain, it would seem that the reformations of St. Benedict were not introduced until a late period ; and in that church as well as in the church of Ireland, they were a subject of considerable controversy. One of the most important modifications of monachism in the west, regarded the nature of the occupation in which the monks were to be engaged during the times not directly devoted to prayer, meditation, or other spiritual exercises. In the east, manual labor formed the chief, if not the sole external occupation prescribed to the monks; it being held as a fundamental principle, that for each individual the main business of life was the sanctification of his own soul. In the west, besides the labor of the hands, mental occupation was also prescribed, not, it is true for all, but for those for whom it was especially calculated. From an early period, therefore, the monasteries of the west, and particularly those of Ireland, or of the colonies, founded by Irish monks, as Iona and Lindisfarne, became schools of learning, and training-houses for the clergy. At a later period, most monasteries possessed a *scriptorium*, or writing-room, in which the monks were employed in the transcription of MSS.; and although a great proportion of the work so done was, as might naturally be expected, in the department of sacred learning, yet it cannot be doubted that it is to the scholars of the cloister we owe the preservation of most of those among the master-pieces of classic literature which have reached our age.

In the remarkable religious movement which characterized the church of the 12th c. (see FRANCIS OF ASSISI, FRANCISCANS), the principle of monachism underwent a further modification. The *spiritual egotism*, so to speak, of the early monachism, which in some sense limited the work of the cloister to the sanctification of the individual, gave place to the more comprehensive range of spiritual duty, which, in the institute of the various bodies of friars (q.v.) which that age produced, made the spiritual and even the temporal necessities of one's neighbor equally with, if not more than, one's own, the object of the work of the cloister. The progress of these various bodies, both in the 12th c. and since that age, is detailed under their several titles. It only remains to detail the later history of monachism, properly so called. The monastic institutes of the west are almost all offshoots or modifications of the Benedictines (q.v.); of these, the most remarkable are the Carthusians, Cistercians, Grandmontines, Clugniacs, Premonstratensians, and above all Maurists, or Benedictines (q.v.) of St. Maur. In more modern times, other institutes have been founded for the service of the sick, for the education of the poor, and other similar works of mercy, which are also classed under the denomination of monks. The most important of these are described under their several heads.

The inclosure within which a community of monks reside is called a monastery (q.v.) —Gr. *monasterion*, Lat. *monasterium*. By the strict law of the church, called the law of cloister or inclosure, it is forbidden to all except members of the order to enter a monastery; and in almost all the orders, this prohibition is rigidly enforced as regards the admission of females to the monasteries of men. To such a length is this carried in the Greek church, that in the celebrated inclosure of Mount Athos, not only women, but all animals of the female sex are rigorously excluded. The first condition of admission to a monastic order is the approval of the superior, after which the candidates remain for a short time as *postulants*. After this preliminary trial, they enter on what is called the *novitiate*, the length of which in different orders varies from one to three years; and at its close, they are admitted to the profession, at which the solemn vows are taken. The age for profession has varied at different times and in different orders; the council of Trent, however, has fixed 16 as the minimum age. Originally, all monks were lay.

men; but after a time, the superiors, and by degrees other more meritorious members, were admitted to holy orders. The distinction of priest-monks and lay-brothers has been already explained under the head FRIAR: but in both alike, where the order is one of those solemnly approved by the church, the engagement taken at the final profession is life-long and irrevocable.

The monastic institute, from the very earliest time, embraced women as well as men. The former were called in Greek by the name *nonis* or *nonna*, and in Latin *nonna* (from which the English *nun*), as also *sanctimonialis*. The cloistered residence of nuns is called by various names, as NUNNERY, CONVENT, a name also applied to the houses of men. The general characteristics of the monastic institute for females are substantially identical with those of the male orders; and as the principal varieties of institute are detailed under their respective heads, it is needless to particularize them here.

It is hardly necessary to say that the reformed churches in the 16th c. discarded the practice of monachism, and suppressed the monastic houses. In some of the German states, the temporalities of the suppressed monasteries were retained, and were granted at pleasure by the sovereign, to be enjoyed together with the titular dignity. Some of the German churches, however, in later times, have revived the institute both for men and for women, as has also been done in the Anglican church both in the time of Laud and in our own day. In all these Protestant revivals of monachism, however, the engagement is revocable at the will of the individual. At the French revolution, the monastic establishments of France were utterly suppressed; and in most of the other Catholic countries of Europe the example has been followed to a greater or less extent. In England and Ireland and America, on the contrary, the institute has made rapid progress within the last 20 years. Most of the orders, however, introduced into these countries are of the active rather than the contemplative class.

MO'NACO, a small principality of Italy, on the coast of the Mediterranean sea, a few miles n.e. of the city of Nice. The climate is fine, so that oranges, lemons, etc., are produced in abundance. Pop. '73, 5,741. From the 10th to the 18th c. Monaco was held by the Genoese family of Grimaldi. In 1815 it was ceded to Sardinia, which, however, recognized its independence, but reserved to itself the right of garrisoning the town of Monaco. At this period it consisted of three communes—Monaco, Mentone, and Roccabruna, with an area of 52 sq.m., and a pop. of about 7,000. In 1848 Mentone and Roccabruna were annexed to Sardinia, in spite of a protest by his "serene highness," Carlo Honorio, third prince of Monaco. The Italian war of 1859 placed the whole territory for a brief period under Victor Emmanuel; but Carlo Honorio having sold Mentone and Roccabruna (Feb. 2, 1861) to the French emperor for 4,000,000 francs, Sardinia was obliged to renounce her hold upon them. The sovereign prince of Monaco now possesses nothing but the city and a small patch of territory, with a total area of 6 sq.m.; pop. '83, 10,108. The town is a beautiful place on a rocky promontory, with 2,879 inhabitants.

MO'NAD (Gr. *monas*, unity), a term borrowed from the Peripatetic philosophy, although employed by moderns in a sense different from that of the Peripatetics, who used it to designate the universe, understood in the pantheistic sense. By moderns, and especialy by Leibnitz (q.v.), from whose system alone the name has derived importance, it is used to describe the primary elements of all matter. The monads are simple uncompounded substances, without figure, without extension, without divisibility, by the aggregation of which all bodies are formed, and into which all compounded things may ultimately be resolved. The monads are created things, but as being uncompounded, are indestructible; and although subject to change, the change is but external or relative. They are of two classes—the first are destitute of consciousness, although possessing an internal activity which is called by the name of perception; the second possess, in addition to perception, a certain consciousness, which is called by the name "apperception" or conscious-perception. The monads of this class are souls, and according to the degree of their consciousness is the distinction between the souls of the higher and those of the lower intelligences. The Deity is the PRIME MONAD, or MONAD OF MONADS. The theory of monads enters largely into the philosophic system of Leibnitz, and indeed furnishes the key to much in that system which is otherwise obscure.

MONAD, *Monas*, the generic name of many kinds of microscopic organisms, very minute, and supposed also to be of very simple organization. They appear, even under a powerful microscope, as mere points, moving rapidly through the fluid in which they exist, and often becoming aggregated in clusters; or they are seen to be gelatinous and globular, or nearly so, with a tail or thong-like filament, by the vibrations of which they move. When the fluid is tinted by means of some harmless coloring matter, the existence of several cells or vesicles is discerned within the minute body. Ehrenberg, therefore, classed them among polygastric infusoria (see INFUSORIA), and no naturalist doubted their right to a place, although one of the lowest, in the animal kingdom. They are now universally regarded as vegetable, and are ranked among algæ. The organisms formerly known as globe animalcules (*volvox*) are clusters of monads produced by gemmation from one, and invested with a common envelope. Monads are of various colors. Their gemmation takes place according to fixed laws, so that the groups assume particular forms, characteristic of the different kinds. Thus, in the "breast-plate animalcule" (*gonium pectorale*), so called from the form which the group frequently presents, a divi-

sion takes place into four, and the number in a group is always either four or sixteen, a group of sixteen always dividing into four parts, each of which contains four monads. —The minute moving points often seen under the microscope are probably often not monads, but spores or germs.

MONAD'NOCK, Grand, a mountain in the s.w. corner of New Hampshire, which from a base of 5 by 3 m. rises to a height of 3,450 feet. It is composed of talc, mica, and slate, can be seen from the state house at Boston, and is a landmark at sea. Thirty lakes, some containing numerous islands, can be seen from its summit.

MONA'GAS, José Tadeo, 1786–1868; b. Venezuela; served under Bolivar in the war of independence, 1810–20. After a number of unsuccessful attempts to overthrow the government, he was chosen to the presidency in 1846. He sent ex-president Paez, against whom he had formerly headed a revolution, into exile, and abrogated the constitution, making himself dictator. He succeeded in maintaining himself in this office till 1859. He declared against and overthrew the government of gen. Falcon in 1868, and was again elected to the presidency, but died before taking his seat.

MONAGHAN, an inland co. of the province of Ulster, Ireland, situated between Tyrone on the n., Armagh and Louth on the e., Meath and Cavan on the s., and Fermanagh on the west. Its greatest length from n. to s. is 37 m.; its greatest breadth e. and w. is 28; the total area being 500 sq.m., or 319,757 acres, of which 285,885 are arable. The population, which in 1861 was 126,340, had fallen in 1881 to 102,748. The general surface is undulatory, the hills, except in the n.w. and e., being of small elevation, although often abrupt; the highest point does not exceed 1254 ft. above the sea. It is interspersed with lakes of small extent, and for the most part of little depth, and, although the streams are numerous, there is no navigable river within its boundaries. In its geological structure the level country belongs to the great central limestone district; the rest is of the same transition formation which is met with in the northern tract of Leinster. No minerals are found in a remunerative quantity; there is a small coal-field in the southern border, but it has not been found profitable to work. The soil is very varied in its character, and for the most part is wet and imperfectly drained, although commonly capable of much improvement; but in general it is found suitable for the production of cereal crops (with the exception of wheat, which is little cultivated), and of flax. The total area under crops in 1876 was 139,739 acres. There were 60,569 acres under oats, and 12,204 acres under flax. The cattle in the same year numbered 85,569; sheep, 15,999; pigs, 32,056. The annual valuation of property in 1874 was £262,432. Monaghan is well supplied with good roads, and is connected by railway with Dublin, Belfast, and Galway, and directly with the coast at Dundalk. The Ulster canal passes through the county. The principal towns of this county are Monaghan (q.v.), Carrickmacross, Clones, and Castle-Blayney. It returns two members to parliament, the constituency being, at the enumeration of 1880–81, 5496. Monaghan, at the invasion, formed part of the grant of Henry II. to De Courcey, and was partially occupied by him; but it speedily fell back into the hands of the native chiefs of the sept MacMahon, by whom (with some alternations of re-conquest) it was held till the reign of Elizabeth, when it was erected into a shire. Even still, however, the authority of the English was in many places little more than nominal, especially in the north; and in the rising of 1641 the MacMahons again resumed the territorial sovereignty. The historical antiquities of the county are of little interest or importance. It possesses two round towers, one very complete, at Clones, the other at Inniskeen; and there are many remains of the ancient earth-works commonly referred to the ante-English period. The total number of children attending the superior and primary schools in the county of Monaghan during 1871 was 12,749, of whom 8,586 were Roman Catholics.

MONAGHAN, chief t. of the county of the same name, is situated on the great north line from Dublin to Londonderry, distant from the former 76 m. n.n.w. Pop. in '81, 3,369. Monaghan, before the union, was a town of some importance, having a charter from James I., and returning two members to the Irish parliament. It is still the center of an active inland trade, and can boast some public buildings of considerable pretensions, among which are the jail, market-house, and court-house. A Roman Catholic college and a cathedral dedicated to St. Mac Carthain also deserve special notice. The general market is on Monday; three markets for agricultural produce are held weekly, and there is also a monthly fair.

MONARCHIANS, "believers in one fountain or source of being," were persons in the early Christian church who did not admit a distinction of persons in the divine Being. Believing strictly in the unity of God, they rejected the orthodox doctrine of the trinity. Traces of their opinions appeared at a very early period of the Christian era, and are alluded to by Justin Martyr as held both by Jews and Christians. He condemns the former for saying that when God communed with the patriarchs it was God the Father who appeared. He makes the same complaint against certain Christians. From this it is manifest that in Justin's day there were nominal Christians, who spoke of the Son as only an unsubstantial energy of the Father. This leading opinion of the monarchians is thought to have been brought into Christianity chiefly through Alexandrian Jews and Gnostics, or, in some instances, to have been derived directly from pagan

philosophy. From pagan religion it could not have come, unless very indirectly, as that took little thought of the unity of God. But whatever its origin, it was embraced by two classes, who differed greatly in their application of the theory: the one, who may be called rationalistic, admitted the divinity of Christ only as being at most a mere power; the other, some of whom were *Patripassians*, identified the Son with the Father, and allowed at most only a trinity of manifestation. "The one," says Schaff, "prejudiced the dignity of the Son, the other the dignity of the Father; yet the latter was by far the more profound and Christian, and accordingly met with the greater acceptance." 1. Those of the first class saw in Christ a mere man filled with divine power; but conceived this divine power as present in him not merely from his baptism, but from the beginning, and admitted his supernatural conception through the Holy Ghost. 2. The second class, whom Tertullian called *Patripassians*, while they professed Unitarian opinions, strove also to hold fast the divinity of Christ; and, as they thought, accomplished their object by merging his independent personality in the essence of the Father. Sabellius, about the middle of the 3d c., denying both trinity of essence and permanent trinity of manifestation, taught that the unity of God, without distinction in itself, after the creation, unfolds itself in the course of the world's development in three different forms and periods of revelation, and after the completion of redemption, returns into unity. The Father (he said) reveals God in the giving of the law and the Old Testament economy; the Son reveals God in the incarnation; and the Holy Ghost reveals God in inspiration. He illustrated this trinity of relations by comparing the Father to the sun, the Son to its enlightening power, and the Spirit to its warming influence. Athanasius pointed out coincidences of thought in the stoic philosophy with the doctrine of Sabellius, which, however, is generally admitted to have been thought out independently in his own mind. He may be regarded as the most original, ingenious, and profound of the monarchians. His system has been revived by Schleiermacher in a very modified form; and is substantially held in still later times by some who, holding to Christ's supreme divinity, deny the union in him of the human and divine natures, and suppose that he was God dwelling in human flesh and subject to its limitations and infirmities. It will be seen that the general principle of monarchianism admits various modifications in theory, and may be pressed in one extreme into a denial of any proper divinity in Christ, and in the opposite extreme to a position scarcely distinguishable from the standard doctrine which has been upheld in the church. See INCARNATION, TRINITY.

MONARCHY (Gr. *monarchia*, from *monos*, alone, and *archō*, to govern; literally, the government of a single individual) is that form of government in a community by which one person exercises the sovereign authority. It is only when the king, or chief magistrate of the community, possesses the entire ruling power that he is, in the proper acceptation of the term, a monarch. Most of the oriental governments past and present, Russia at present, and Spain and France as they were in the last century, are in this strict sense monarchies. The degenerate form of monarchy is tyranny, or government for the exclusive benefit of the ruler. When the head of the state, still possessing the status and dignity of royalty, shares the supreme power with a class of nobles, with a popular body, or with both, as in our own country, the government, though no longer in strictness monarchical, is called in popular language a mixed or limited monarchy, the term absolute monarchy being applied to a government properly monarchical. The highest ideal of government would perhaps be attained by an absolute monarchy, if there were any security for always possessing a thoroughly wise and good monarch; but this condition is obviously unattainable, and a bad despot has it in his power to inflict infinite evil. It therefore becomes desirable that a governing class, composed, if possible, of the wisest and most enlightened in the country, should share the supreme power with the sovereign. A limited monarchy has this advantage over an aristocratic republic that, in difficult crises of the nation's existence, royalty becomes a neutral and guiding power, raised above the accidents and struggles of political life.

Monarchy, most usually hereditary, has sometimes been elective, a condition generally attended with feuds and distractions, as was the case in Poland. The elective system is still followed in the choice of the pope. Constitutional monarchy may be in its origin elective, or combine both systems, as when one family is disinherited, and the scepter declared hereditary in the hands of another under certain conditions. See KING, REPUBLIC.

MONASTERY has been described under the head of Monachism (q.v.) as the generic name of the residence of any body of men, or even, though more rarely, of women, bound by monastic vows. It may be useful, however, to detail the various classes of monastic establishments of the western church, and to point out the leading characteristics of each. The name, in its most strict acceptation, is confined to the residences of monks, properly so called, or of nuns of the cognate orders (as the Benedictine), and as such, it comprises two great classes, the *abbey* and the *priory*. The former name was given only to establishments of the highest rank, governed by an abbot, who was commonly assisted by a prior, sub-prior, and other minor functionaries. An abbey always included a church, and the English word *minster*, although, like the cognate German *münster*, it has now lost its specific application, has its origin in the Latin *monasterium*. A *priory* supposed a less extensive and less numerous community. It was governed by

a prior, and was originally, although by no means uniformly, at least in later times, subject to the jurisdiction of an abbey. Many priories possessed extensive territorial domains, and of these, not a few became entirely independent. The distinction of abbey and priory is found equally among the Benedictine nuns. In the military orders, the name of *commandery* and *preceptory* corresponded with those of abbey and priory in the monastic orders. The establishments of the mendicant, and, in general, of the modern orders, are sometimes, though less properly, called monasteries. Their more characteristic appellation is *friary* or *convent*, and they are commonly distinguished into *professed houses* (called also *residences*), *novitiates*, and *colleges*, or *scholastic houses*. The names of the superiors of such houses differ in the different orders. The common name is *rector*, but in some orders the superior is called *guardian* (as in the Franciscan), or *master*, *major*, *father superior*, etc. The houses of females—except in the Benedictine or Cistercian orders—are called indifferently *convent* and *nunnery*, the head of which is styled *mother superior*, or *reverend mother*. The name *cloister* properly means the inclosure; but it is popularly used to designate, sometimes the arcaded ambulatory which runs around the inner court of the building, sometimes, in the more general sense, of the entire building, when it may be considered as synonymous with *convent*.

MONASTIR', Toli-Monastir, or Bitolia, a t. of European Turkey, capital of the vilayet named after it, is situated in a broad valley of the Niji mountains, 90 m. n.n.e. of Janina, and about the same distance w.n.w. of Saloniki. It is an important place, is the residence of the governor-general, and commands the routes between Macedonia and northern Albania. The inhabitants are mostly Greeks and Bulgarians. Monastir has 11 mosques, and carries on a large trade with Constantinople, Saloniki, Vienna, and Trieste. From Constantinople alone it annually buys goods to the value of £1,500,000. Its bazaars, containing more than 2,200 shops, are well stocked with the products of western Europe and the colonies, as also with native manufactures. Yet it is one of the worst built and most tasteless towns in all Turkey. Pop. 34,000.

MONASTIR, a seaport t. of north Africa, in the dominion of Tunis, 80 m. s.s.e. of the city of that name, on the gulf of Sidra. Woolen and camlet fabrics are manufactured, and there is some maritime trade. Pop. 12,000.

MONBODDO, James Burnet, Lord, a Scottish lawyer and author, was b. at Monboddo, in Kincardineshire, in 1714, educated at Marischal college, Aberdeen, where he displayed a great fondness for the Greek philosophers, and afterwards studied law for 3 years at Groningen, in Holland. In 1737 he became a member of the Scottish bar, and soon obtained considerable practice; but the first thing that brought him prominently into notice was his connection with the celebrated Douglas case, in which Mr. Burnet acted as counsel for Mr. Douglas. In 1767 he was raised to the bench by the title of lord Monboddo. He died May 26, 1799. Monboddo's first work, on the *Origin and Progress of Language* (1771–76), is a very learned, heretical, and eccentric production; yet in the midst of its grotesque crotchets there occasionally flashes out a wonderfully acute observation, that makes one regret the distorted and misapplied talent of the author. The notion that men have sprung from monkeys, is perhaps that which is most commonly associated with the name of Monboddo, who gravely asserted that the orang-outangs are members of the human species, and that in the bay of Bengal there exists a nation of human creatures with tails, and that we have only worn away ours by sitting on them, but that the stumps may still be felt. Monboddo wrote another work, entitled *Ancient Metaphysics*, which was published only a few weeks before his death.

MONBUTTOO, a country in central Africa, between 3° and 4° n. lat., and 28° and 29° e. long.; 4,000 sq.m.; estimated pop. '70, 1,000,000. It is an elevated table-land, 2,500 ft. above the sea. The Keebaly and Gadda rivers flow through it, uniting to form the Welle, which, after a westerly course through s. Nyam-Nyam, joins the Shary, the source of lake Tchad. The soil spontaneously produces so many fruits and edible roots that cultivation is small, restricted for the most part to tobacco, sugar cane, and sesame. There are few domestic animals. The inhabitants are lighter colored than the surrounding nations; they are cannibals, fond of the chase, and skillful in the working of copper, iron, and wood. Polygamy and circumcision are practiced. The art of weaving is unknown. There is a considerable trade in ivory.

MONCÁDA, Don Francisco de, Conde de Osona, an historian and one of the Spanish classics, b. Dec. 29, 1586, at Valencia, where his grandfather was then viceroy. Descended from one of the greatest families of Catalonia, he rapidly rose to the highest offices in the state, was ambassador to Vienna, and latterly governor of the Netherlands, and commander-in-chief of the Spanish troops there. He distinguished himself both as a statesman and a soldier. He fell at the siege of Goch, a fortress in the duchy of Cleves, in 1635. His *Historia de la Expedicion de Catalones y Aragoneses contra Turcos y Griegos* (Barcelona, 1623, and frequently reprinted), is a masterpiece in liveliness and elegance of style.

MONCALIE'RI, a t. of Italy, in the province of Turin, situated finely on the slope of a hill, on the right bank of the Po, 5 m. above Turin. Pop. 3,030. Moncalieri is the first railway station between Turin and Genoa, and communicates daily with Turin by frequent omnibuses; it has fine buildings, including a palace lately embellished for the

residence of king Victor Emmanuel. The annual cattle-fair held in October at Moncalieri is the most important of the north of Italy.

MONCK, a co. in s. Ontario, on lake Erie; 373 sq.m.; pop. 17,145. The Canada Southern, the Grand Trunk, and the Great Western railroads pass through it.

MONCK, Charles Stanley, Viscount, b. Ireland, 1819; educated at Trinity college, Dublin, and called to the Irish bar in 1841. He was elected to parliament as a liberal member for Portsmouth in 1852, and re-elected in 1855, but was unsuccessful in 1857. He was a lord of the treasury from 1855 to 1858, and was appointed governor-general of Canada in 1861. He was reappointed in 1867, but resigned the next year. In 1871 he served on the Irish national education commission, and on the commission to carry out the act for the disestablishment of the Irish church. He succeeded his father as viscount in the Irish peerage in 1849, and was made a viscount in the peerage of Great Britain in 1866.

MONCREIFF-WELLWOOD, Sir Henry, 1750–1827; b. Scotland; son of the rev. sir William Moncreiff, and assumed the additional name of Wellwood late in life. Having been educated at Glasgow and Edinburgh, he was ordained, 1771, as successor to his father at Blackford, and continued there until 1775, when he became minister of St. Cuthbert's, Edinburgh. Always a member of the evangelical party in the church, he became at length its leader. His published works are: *Discourses on the Evidence of the Jewish and Christian Revelations; The Life and Writings of Dr. John Erskine;* and *Sermons,* 3 vols.

MONCTON, a t. in Canada, province of New Brunswick, co. of Westmoreland, the terminus of the Moncton to St. John's division of the Intercolonial railway; pop. 5,032. It is a port of entry, with a convenient harbor, very pleasantly located at the head of navigation of the Petitcodiac river, which empties into Chignecto bay, the n. extremity of the bay of Fundy. It has several hotels, 4 churches, a variety of stores, and a telegraph office. It contains the offices of the Intercolonial railway and repair shops. It has 2 banks, and its leading industries are the manufacture of steam-engines, machinery, cigars, leather, hardware, and castings. It has a great trade in lumber.

MONDAY (Ger. *Montag,* Lat. *Lunæ Dies,* the day of the moon, Fr. *Lundi*), the second day of the week. The name descends from the Romans, who named the days of the week after the planets.

MONDOÑE'DO, a t. in Galicia, Spain, n.n.e. of Lugo; pop. 2,452. It has a cathedral and a castle. There are tanneries, and manufactures of cotton cloth, and linen.

MONDO'VI, an episcopal t. in Cuneo, one of the northern provinces of Italy, situated on the summit and shoulder of an Alpine hill, 50 m. s. of Turin. It is divided into four sections: the piazza—encircled by walls, and containing the chief buildings of the place, and the suburbs, Carassone, Breo, and Piano del Valle. In the neighborhood considerable activity exists in cloth, silk, and bonnet-straw manufactories; but in spite of vineyards and chestnut woods, the numerous remains of ruined buildings in its vicinity impart an air of desolation to the locality. The Piazza contains a fine cathedral, with rich paintings; an episcopal palace, with a noble gallery of portraits; and the various judicial and educational halls. Pop. 12,300. At the battle of Mondovi, on April 22, 1796, the Sardinians were totally defeated by Bonaparte, and the entrance into Piedmont secured to the French army. The province of Mondovi is intersected by spurs of the Alps, and contains rich marble quarries and valuable mineral products.

MONE'SIA BARK, the bark of a tree, *chrysophyllum glycyphlæum,* or *C. Buranheim,* of the same genus with the star apple (q.v.), a native of the s. of Brazil. The bark is lactescent; but when dried, it is thick, flat, compact, heavy, brown, and hard, with a taste at first sweet, afterwards astringent and bitter. A substance called *monesia* is extracted from it, which is almost black, at first sweet, then astringent, and finally acrid. It is used as a stomachic and alterative in leucorrhœa, chronic diarrhœa, etc. It contains, in small quantity, a principle called *monesin.*

MONETARY COMMISSION of the U. S. Congress. The mistaken demonetization of silver by congress in the coinage act of Feb. 12, 1873, passing almost unnoticed during that year, soon afterwards attracted the attention of thoughtful men. Its possible consequences loomed portentously into view, as the subject was more and more studied. Within three years it became a theme of general discussion in the United States. It was a prolific source of debate in the 44th congress; and on Aug. 15, 1876, the senate initiated a joint resolution for the appointment of a joint commission of three senators, three members of the house, with experts, not exceeding three, to be selected by the former, whose duty was to inquire, "First, Into the change which has taken place in the relative value of gold and silver; the causes thereof, whether permanent or otherwise; the effects thereof upon trade, commerce, finance, and the productive interests of the country, and upon the standard of value in this and foreign countries: Second, Into the policy of the restoration of the double standard in this country; and, if restored, what the legal relation of the two coins, silver and gold, should be; Third, Into the policy of continuing legal-tender notes concurrently with the metallic standards, and the effect thereof

upon the labor, industries, and wealth of the country; Fourth, Into the best means for providing for facilitating the resumption of specie payments."

The commission as organized consisted of Messrs. John P. Jones, Lewis V. Bogy, and George S. Boutwell, of the senate; Randall L. Gibson, George Willard, and Richard P. Bland, of the house of representatives; Wm. S. Groesbeek of Ohio, and Prof. Francis Bowen of Massachusetts. Geo. M. Weston of Maine was appointed secretary. The sessions of the committee were held in New York until December of that year, and afterwards in Washington. Circulars were immediately issued by the commission to men of eminence in monetary studies, to authors, bankers, and business men in the United States and Europe, to elicit the widest possible information on the topics of the resolution. The chambers of commerce in the cities were invited to furnish, and did furnish, lists of persons most competent to give information. The U. S. representatives in foreign countries were required to aid in the work. The commission entered upon its duties with energy, collected vast stores of information, and were aided by the most eminent political economists and financial writers of all schools, who were glad to have such an opportunity for the elucidation and comparison of their views. The main substance of the report was submitted and ordered to be printed Mar. 2, 1877. It is a masterly condensation of the philosophy and facts bearing on money questions; embracing clear statements of all schools of opinion. The conclusions of the commission were not unanimous. But the majority report not only exhibits such grasp of the whole subject, but has also been so far proved correct in its deductions by facts which have since become a part of monetary history, that the several dissents of individual members of the committee from certain parts of the majority report are not of much importance. On the whole, the report is the most valuable compendium of facts and monetary theories ever published. It takes rank in point of ability with the famous bullion report of England in 1810; but covers a far wider field, and introduces social science problems in connection with the money question not taken into consideration by the British committee. The latter sifted financial questions from bankers' points of view: the U. S. commission reviews the subject in the light of the public weal—the greatest good to the greatest number.

The conclusions of the majority of the committee on the first questions submitted are: That the recent production of silver relatively to gold has not been greater than formerly; that the (then) recent fall in the price of silver was not caused by any recent large production; but mainly by the concurrent demonetization of silver in Germany, the United States, and the Scandinavian states, the closure of the mints of Europe to its coinage, the temporary diminution of the Asiatic demand, the exaggeration of the actual and prospective yield of the Nevada silver mines, and a prevailing idea that the efforts of holders of government securities would bring about its demonetization: that gold is more fitful in production than silver; that the average production of both is more steady than of either one; "that to annihilate the money function of one must greatly increase the purchasing power of the other, and greatly reduce prices;" that "silver to the amount of $3,000,000,000 in coin, the accumulation of 50 centuries, is so worked into the web and woof of the world's commerce that it cannot be discarded without entailing the most serious consequences, social, industrial, political, and commercial;" that "the evil is enormously aggravated by selecting gold as the metal to be retained and silver as the metal to be rejected;" that "the exchanges of the world, and especially of this country, are continually and largely increasing, while the supplies of both the precious metals, taken together, if not diminishing are at least stationary, and the supply of gold, taken by itself, is falling off; and that to submit the vast and increasing exchanges of this country and the world to be measured by a metal never to be depended on in its supply, and now actually diminishing in its production, would make crisis chronic, and business paralysis perpetual." Covering the second question the commission recommend the restoration of the double standard and the unrestricted coinage of both metals. The report on the third question for solution refers to the answer to the fourth, viz.: "the best means for providing for facilitating the resumption of specie payments." To this question the report answers, that "the remonetization of silver is a measure essential to specie payments, and may make such payments practicable." The commission believe "that the remonetization of silver in this country will have a powerful influence in preventing, and probably will prevent, the demonetization of silver in France and other European countries;" that remonetization by the United States, even without change in legislation elsewhere, will draw to us silver from other countries while it is cheap, in exchange for what we have to export; and that this country will have the benefit of the rise which the committee believe will take place in its value when the temporary causes of its depression have passed. The report concludes with these words: "If the states of the Latin union, or other countries in Europe, abandon the double standard after we re-adopt it, or because we re-adopt it, it will be a policy on their part through which great advantages will inure to us, and great disasters will befall them. It would inaugurate in the United States an era of prosperity, based upon solid money, obtained on profitable terms, and under circumstances necessarily stimulating to our industry and commerce."

"Finally, the commission believe that the facts that Germany and the Scandinavian states have adopted the single gold standard, and that some other European nations may possibly adopt it, instead of being reasons for perseverance in the attempt to establish it

in the United States, are precisely the facts which make such an attempt entirely impracticable and ruinous. If the nations on the continent of Europe had the double standard, a gold standard would be possible here, because, in that condition, they would freely exchange gold for silver. It was that condition which enabled England to resume specie payments in gold in 1821. The attainment of such a standard becomes difficult precisely in proportion to the number and importance of the countries engaged in striving after it; and it is precisely in the same proportion that the ruinous effects of striving after it are aggravated. To propose to this country a contest for a gold standard with the European nations is to propose to it a disastrous race, in reducing the price of labor and commodities, in aggravating the burdens of debt, and in the diminution and concentration of wealth, in which all the contestants will suffer immeasurably, and the victors even more than the vanquished."

Mr. Boutwell alone makes a minority report against remonetization of silver, except on a previously agreed basis, adopted in conjunction with European nations. Prof. Francis Bowen expresses his dissent from the conclusions of the majority of the committee at much length; and, while he argues for the gold basis alone, he finally reports in favor of the remonetization of silver, on adding to the quantity of pure silver in a dollar enough to make its bullion value equal to the then value of gold per dollar, and also recommends the reduction of the value of our gold coins, so that a five dollar piece shall be the equivalent of the English pound sterling. He also recommends that the paper money of the government should be gradually taken up by the treasury department and destroyed. In addition to the summary of the report, the first volume, as issued by the government, embraces papers prepared for the commission by Geo. M. Weston on "Asiatic trade and flow of silver to the East;" "Constitutional powers of Congress and the States with respect to metallic money;" "Legislation on subsidiary silver coins;" and "The trade dollar." The appendix to the same volume contains a report on silver production in the United States; the world's production of gold and silver; relative value of gold and silver; population and specie in the western world; demonetization of silver in Germany; payment of French indemnity of 1871; movement of specie to India; standard of the United States; coinage of the United States; money standard for Great Britain; monetary system of Austria-Hungary and China: also, papers furnished by all the foreign ministers of the United States. The second volume contains written and oral answers by men of eminence in monetary science, and by those of great experience in business, both in the United States and Europe, in reply to a series of questions agreed upon by the commission. Among the citizens of this country from whom written answers were drawn were Henry C. Carey, John A. Dix, Henry S. Fitch, August Belmont, John J. Bennett, Barclay & Livingston, Royal Phelps, W. L. Fawcett, O. D. Ashley, R. M. Waters & Co., Samuel Hoard, W. G. Sumner, Wm. E. DuBois, Albert Miller, J. K. C. Forrest, B. F. Nourse, F. P. Knight, Robert Patterson. Among foreigners who responded were G. B. Airy, Francis Jourdan, Hector M. Hay, Ernest Seyd, E. de Parieu, and Henri Cernuschi. The oral testimony was from a large number of distinguished Americans, and is very interesting.

MONETARY CONFERENCE, International: Paris, Aug., 1878. The profound interest awakened in the United States and Europe from 1867 to 1878 by the legislation of various countries to demonetize and remonetize silver, and to restrict and to expand the coinage; the discussions on the subject of a single metal, or of two metals, as the wiser and safer basis of value of the world's money,—induced the United States congress, in the act which remonetized silver, Feb. 28, 1878, to insert the following: "Sec. 2. That immediately after the passage of this act, the president shall invite the governments of the countries composing the Latin union, so-called, and of such other European nations as he may deem advisable, to join the United States in a conference to adopt a common ratio between gold and silver, for the purpose of establishing, internationally, the use of bi-metallic money, and securing fixity of relative value between those metals; such conference to be held at such place in Europe or the United States, at such time within six months, as may be mutually agreed upon by the executives of the governments joining in the same, whenever the governments so invited, or any three of them, shall signify their willingness to unite in the same." The section further provides that the president shall appoint three commissioners to the conference. Ex-Governor Reuben E. Fenton of N. Y., Wm. S. Groesbeck of Ohio, and prof. Francis A. Walker of New Haven, were appointed. Subsequently the president was authorized to add to the list of delegates Mr. S. Dana Horton, of Ohio, an accomplished monetary student and author. Paris was chosen as the place of conference. Austria-Hungary, Belgium, France, Great Britain, Greece, Italy, the Netherlands, Russia, Sweden-Norway, and Switzerland sent their ablest representatives. The German government alone declined to participate in the conference, though a second time invited.

The conference opened its session Aug. 10, 1878, at the office of the ministry of foreign affairs. Leon Say, minister of finance in France under the presidencies of Thiers and McMahon, son and grandson of the most eminent of French writers on political economy, was made president of the conference, and Mr. Fenton vice-president. In his opening address to the conference Mr. Say stated the reasons which had induced the five states composing the Latin union "while preserving to silver its legal tender quality, to restrict its coinage within narrow limits, and, within the past year, to suspend

it entirely." These reasons were the adoption by Germany of the single standard of gold, and the great production of the American silver mines. While Germany continued to gather and sell her silver he thought it would be difficult to determine the value at which silver might be rated when that disturbing element in its present value was out of the way. The Latin union, therefore, while glad to join in the American efforts to fix a ratio of value between silver and gold, "as a measure of prudence has remained in an expectant attitude." Mr. Fenton then presented the object of the call for the conference in the language of the act of congress. Count Rusconi of the Italian delegation suggested as more logical to first decide whether such a fixed ratio was possible. Mr. Say observed that as questions of fact should precede those of theory he would favor an avoidance of theoretical discussion at present, and first study facts and their relations. The first session closed with the understanding that the delegations should come to the next meeting prepared with full statistics of the monetary condition of their respective states. At the second session—Aug. 16—all the required documents were submitted. A brief summary of the position taken by the delegates at the subsequent sessions will best exhibit the animus of the conference. Mr. Broch, representative from Norway, observed that as Sweden and Norway had the gold standard they could participate in the conference only on the supposition that the United States desired to treat of more general questions; as of a coin for universal circulation. On that supposition only, and with the understanding that England was present on the same condition, his government had authorized participation in the conference. Mr. Groesbeck was called upon to state the position of the United States. It was, he said, simply "to restore silver to its former position; to equalize gold and silver upon a ratio to be fixed by agreement." The United States delegation could not commit their country to any agreement, but, like the delegates from Norway and Sweden, were interested to discuss the question of the establishment of coin for universal circulation. He corrected the supposition that the United States desired the full restoration of silver because it was the great silver producing country. He denied that in its legislation to preserve silver as money the United States had been influenced by the value of its present product of silver; the government having no direct interest, even by taxes, in the product; stating that the mines are owned indiscriminately by Americans and foreigners; and that London is so much the greater market for silver that the Unites States treasury had found itself compelled to buy as much silver in London as in America. He stated that within 25 years the yield of gold in the United States had been four times as great as that of silver, and that the falling off in production at the present time was more in silver than in gold. The remonetization of silver he showed to be on the part of the United States simply a return to a traditional policy with which the interests of the people are interwoven, and from which it was through careless legislation, rather than by design, that they had departed; and that therefore the United States could not be charged with a new motive of selfishness in its maintenance.]

Mr. Groesbeck submitted the following propositions to the conference: "1. It is the opinion of this assembly that it is not to be desired that silver should be excluded from free coinage in Europe and the United States of America. On the contrary, the assembly believe that it is desirable that the unrestricted coinage of silver and its use as money of unlimited legal tender should be retained where they exist, and, as far as practicable, restored where they have ceased to exist. 2. The use of both gold and silver as unlimited legal tender money may be safely adopted. First, by equalizing them at a relation to be fixed by international agreement; and secondly, by granting to each metal at the relation fixed, equal terms of coinage, making no discrimination between them." Mr. Pirmez of Belgium rejected the American propositions on behalf of his delegation. Count Rusconi of Italy desired first to discuss and vote on the principle, Is it possible to establish a fixed relation between silver and gold? He desired to vote affirmatively on that proposition first, and then proceed with the practical examination of a ratio. Mr. Broch of Norway, which has the gold standard, maintained that the history of silver showed a constantly decreasing value relatively to gold, and that during the enormous influx of gold from California and Australia after 1849 gold had dropped but 2 per cent below the French silver standard. Mr. Herzog of Switzerland opposed the American proposition; not that he desired silver demonetized, but that he thought it better for one nation to have the gold, and another the silver unit as now; and did not believe in the practicability of an international unit.

At the opening of the third session Mr. Goschen of England, and Mr. Mees of the Netherlands, questioned the American delegates concerning the certainty of resumption of specie payments the coming January. The statements in reply drew from Mr. Goschen the remark that there was no doubt of the ability of the United States to resume, and that his question had been put to enable him to form a judgment of the extent to which the United States might become buyers of silver in the world's markets. The U. S. treasury statement, he said, showed an exceedingly small holding of silver compared with gold. Mr. Groesbeck stated that, were an international agreement concluded on the American basis, the United States would absorb for the benefit of Europe not merely its own production, but a part of the German silver. Mr. Goschen called attention to the fact that "the United States invited the delegates to adopt a proposition which some of them were precluded by their instructions from entertaining," as they

could not vote to compromise the existing standards of their countries; but "there was one part of the American propositions for which almost all the delegates could vote; and for which as a principle, personally, he would willingly subscribe, viz., that it is not desirable that silver cease to be one of the money metals. . . . Though England had a gold standard she had great interest in the maintenance of silver as currency. She had a more defined and less compromised position for the discussion of this question than other countries, for she had borne the depreciation of silver in India without trying to shut her doors upon it. She had done more than any other country to maintain silver. The Latin union had shut its doors upon silver. Holland half shut hers, while England had allowed it to take its natural course, and for five years had borne all the burdens resulting therefrom. Mr. von Henglemüller of Austria-Hungary could subscribe to the propositions of the United States, but since the advantage of this system depended upon the general adoption of it, his government was compelled to maintain an attitude of expectancy. As a member of the conference he would pronounce for the double standard. Mr. Mees of the Netherlands said that while England and Germany maintained the gold standard no other was possible for his country, but he could express his personal opinion that "it would be most beneficial to mankind that many states should adopt the double standard." He believed that in the Dutch colonies they would find it to their interest to maintain the silver standard. He agreed with Mr. Goschen that if the double standard were utopian, the single gold standard was also, and one that would be very dangerous if by some possible combination of circumstances it should be realized. He suggested that the United States unite with South America and Asiatic nations on silver, and then come to Europe with their proposition. Mr. Baralis of Italy thought that upon some points there was such a harmony of views that, if the precise propositions of the United States could not be adopted, at least some measure of utility closely allied to them might be. He did not sympathize with the advice to the delegates of the United States to seek allies in South America and China; and thought that the nations of Europe could now join in some practical affirmation in the direction of the propositions of the United States. Leon Say explained the monetary policy of France of late years as having the double standard in theory, but not in practice, the privilege of free coinage of silver at the mint having been withdrawn. When this suspension of free coinage first took place the question was warmly discussed in the French chambers whether it was a step towards the gold standard, or a provisional condition, which would permit France to avail itself of a favorable moment for returning to the double standard. The government declared emphatically that the movement was *not* towards the single gold standard. France is in "a condition of expectancy, from which we shall not move except for good reasons, when they show themselves, and then, probably, to re-enter into the system of the double standard." He stated that there were in the bank of France and in circulation in France 2,500,000,000 francs in silver; and that "to withdraw the legal tender power from such a mass of money, and to throw it on the market as merchandize is an inadmissible idea." He thought that until Germany had finished her sales of silver, France would remain in an attitude of expectancy. The proposition of the United States at the present moment seemed to him premature; and as its rejection by a majority would lead to a false conclusion as to the opinions of those at this time voting against its propositions as a whole, he suggested that they should not be passed upon, but that the states represented should agree simply upon the expression of a common idea as to the employment of silver as money, and should invite each other reciprocally not to take any measures in their domestic legislation which might depreciate silver. In his opinion, encouragement of the use of silver money will soon increase its value. He expressed assent to the first paragraph of the American proposition. He believed France might some day join the United States, assenting to the rest of their propositions; but not now. Mr. Feer Herzog of Switzerland announced himself energetically for the single gold standard; not for all nations, but "for the advanced nations, and leave silver to countries whose civilization is backwards or stationary." He announced that, with the Netherlands, Switzerland would maintain the "attitude of expectancy" with the hope of seeing the single gold standard eventually adopted by all. Count Rusconi of Italy was glad to see the general harmony of views on the necessity of continuing the monetary use of silver; and believed there was no difficulty in squarely admitting the fundamental propositions of the Americans. He believed further that when an international agreement as to legal ratio was arrived at, it alone would produce the equality desired; that "nature makes the metal, but law alone makes the money." Mr. H. H. Gibbs, ex-governor of the bank of England, announced himself a partisan of the gold standard, but would not legislate to drive silver out of use. He expressed entire dissent from the notion of Mr. Herzog that the fall of silver was in the ratio of the progress of civilization, by which the most progressive will use the most precious metal, and the less civilized will be content with the other. He believed the recent fall of silver entirely the result of a simultaneous action of many temporary causes, and that the action of Germany was an important factor in the result. He illustrated the greater effect produced on the market by the German mass of coins put up for sale than by any ordinary increase or decrease of production: lessening the use of silver, and at the same time glutting the market with it. The third session of the conference closed the first expressions of opinion volunteered by delegates from European nations on the American propositions.

The fourth session of the conference was opened by prof. Francis Walker in a remarkably vigorous address in support of the American propositions, and in refutation of the objections made to them. He maintained that down to 1873 silver had been the principal money of the world, and the sole money of many prosperous nations; that it had ceased, to whatever extent, to be money, not as the result of natural causes, but by action distinctly political—the laws and decrees of governments; that it is no reversal of any law of nature that the American delegates propose, but the reversal of recent works of men's devising in opposition to the natural economic forces which gave silver its position as money. "As," said he, "the conferenee of 1867, wholly absorbed in the consideration of the means of securing international coinage, did exert a powerful influence in initiating the movement for demonetizing silver, it remains for the conferenee of 1878, with a more sober judgment, and a larger view of human interests, instructed as the nations have been by the bitter experience of the past few years, to put forth its hand to stay the progress of that demonetization which has already brought such mischiefs upon trade and the production of wealth." Mr. S. Dana Horton of the American delegation followed in further defense of the American propositions. He analyzed and refuted with masterly comprehensiveness the objections, both as to the principles involved, and the fitness of the present time for their application. He re-stated the essential point to which the American delegates desired to confine the discussion, viz., "Is it in the interest of the states represented at this conference to continue to wage a monetary war by seeking, to each other's prejudice, to get rid of the falling metal; or, is it their interest to unite together in order by a common legislation to give to the monetary basis of the business world a stability which it does not now possess?" These speeches of Messrs. Walker and Horton exhibited a masterly familiarity with principles, with law, and with monetary history in all its relations, and were at the same time so aggressively decisive in their maintenance of the American propositions that the majority of the conference, opposed to them from the beginning, showed a plain inclination to put an end to discussion by a decisive vote and an adjournment. But a more generous courtesy prevailed, and the discussion was continued at a sixth session, at which Mr. Groesbeck presented a remarkably clear and condensed summary of the situation which no abstract can fairly present. At its conclusion Mr. Pirmez of Belgium undertook to meet the American presentation of the subject. Fluent, ingenious, and somewhat satirical, he made a good speech; but it was like the firing of small arms against a massive fortification. Mr. Horton's response left no standing ground for the other side except what the astute president Say had announced at the opening session, viz., that theoretically we may be with you, but practically *not now*. Mr. Horton, in conclusion, reviewed the points gained by the development of national policies in the conferenee, especially by the new and broader position assumed by England, claiming that, "independently of any other result, this much has already been gained: that the conference of 1878, breaking with the traditions and doctrines of 1867, will have inaugurated a new era in the history of monetary science in our time, and that it will a in manner fix the date of the decline of the theories of mono-metalism." The response of the delegates of European states was then submitted. It is as follows:

"The delegates of the European states represented in the conferenee desire to express their sincere thanks to the government of the United States for having procured an international exchange of opinion upon a subject of so much importanee as the monetary question. Having maturely considered the proposals of the representatives of the United States, they recognize:

"1. That it is necessary to maintain in the world the monetary functions of silver as well as those of gold, but the selection for use of one or the other of the two metals, or of both simultaneously, should be governed by the special position of each state or group of states.

"2. That the question of the restriction of the coinage of silver should equally be left to the discretion of each state or group of states, according to the particular circumstances in which they may find themselves placed; and the more so in that the disturbance produced during the recent years in the silver market has variously affected the monetary situation of the several countries.

"3. That the differences of opinion which have appeared, and the fact that even some of the states which have the double standard find it impossible to enter into a mutual engagement with regard to the free coinage of silver, exclude the discussion of the adoption of a common ratio between the two metals."

The animus of this very courteous, but not quite satisfactory response, is evident. France, at the head of the Latin union, holds the balance of power between gold and silver. Recognizing the equal money power of each metal, and conscious of the value of her own astuteness in the use of the power of the Latin union she does not care to abandon that advantage for any humanitarian or commercial advantage to any association of nations. Her "attitude of expectancy" has an eye on Germany and England, and as her monetary legislation has been based on a clearer insight into the philosophy of monetary science than that of other countries, as proved by its practical results, the preservation of the right of independent action, untrammeled by agreements for co-operation. gives her a vantage ground for national aggrandizement through the financial blunders of other nations.

Messrs. Rusconi and Baralis of Italy at the sixth session, entered a protest against the response of the majority of the European delegates as follows:

"1st. That by the adoption of the formula proposed, the conference does not respond to the question which was put to it, and that in systematically avoiding to pronounce itself upon the possibility or impossibility of a fixed relation, to be established by way of international treaty, between coins of gold and silver, it leaves its task unfinished.

"2d. That since the French law established such a relation (1785) between the two metals, the oscillations of their relative value had been without importance, whatever had been the production of the mines.

"3d. That consequently, *a fortiori*, if the law of France had been alone able to accomplish the result, then on the day when France, England, and the United States, by international legislation, should agree to establish together the relation of value of the two metals, this relation would be established upon a basis so solid as to become unshakable."

Mr. Goschen, on the part of England, desired it to be distinctly understood that the adhesion of himself and colleagues to the response was because it *did not* pronounce for a double standard; and that he desired with equal distinction "to combat the theory of the economists who demand the universal adoption of the single gold standard—a measure which, in his view, might be the cause of the greatest disasters." Mr. De Thoerner, the Russian delegate, expressed a decided adherence to the single standard of his country —gold, and desired the response construed to mean nothing outside of its exact language. Count Von Kuefstein of Austria, said that "in presence of the explanations which had been given, from which might be inferred an admission of the impossibility of an international agreement for the double standard, he felt himself obliged to declare that if he adhered to the formula proposed by the European delegates, it was precisely because in his view it did not exclude the idea that such an arrangement was possible."

The practical work of the conferenee closed with the reading of the following rejoinder, signed by the four American delegates, to the response of the European delegates:

"The representatives of the United States regret that they cannot entirely concur in all that has been submitted to them by a majority of the representatives of European states. They fully concur in a part of the first proposition, viz., that 'it is necessary to maintain in the world the monetary functions of silver as well as those of gold,' and they desire that ere long there may be adequate co-operation to obtain that result. They cannot object to the statement that 'the selection for use of one or the other of these two metals, or of both simultaneously, should be governed by the special position of each state;' but if it be necessary to maintain the monetary functions of both metals, as previously declared, they respectfully submit that the special positions of states may become of but secondary importance.

"From so much of the second proposition as assigns as a special reason for at present restricting the coinage of silver, 'that the disturbance produced during the recent years in the silver market has differently affected the monetary situations of the several countries,' they respectfully dissent, believing that a policy of action would remove the disturbanee that produced these inequalities.

"In regard to the third and last proposition, they admit that 'some of the states which have the double standard,' or, as they prefer to say, use both metals, 'find it impossible to enter into a mutual engagement for the free coinage of silver.' They, as representatives of the United States, have come here expressly to enter into such an engagement. The difficulty is not with them; and wherever it may be, they trust it may soon be removed.

"They entirely concur in the conclusion drawn from this state of the case, that 'it excludes the discussion of the question of the adoption of a common ratio between the two metals.' It is useless to agree upon a ratio between the two metals if the nations are not ready also to adopt a policy to uphold it. We remain upon ours; the European states upon theirs."

From the beginning to the end it was evident that the little countries embraced with France in the Latin union had special interests to protect that made the broader views and leaning of the American delegates obnoxious to them. England, on the other hand, took a position at the conference that exhibited all the largeness of view that comes of imperial interests in all parts of the world. Favoring a silver unit on one side of the globe and a gold unit on the other, she hopes by the skill of her commercial transactions between the opposite parts to profit by the two different standards, rather than by the joint-standard. What part of the membership of the conference represented the views of great banking houses rather than the interests of peoples, it would be difficult to determine; but that those interests are always likely to be too largely represented in such national conferences is evident. That Belgium and the Netherlands should have a vote in the conference equal to that of England, France, or the United States, is an absurdity. That little Switzerland, under the shadow of France, should be the sole determined advocate of the single gold standard was simply amusing. Yet her vote was half that of the United States. The effect of wide national diversity of interests was clearly seen in the broader views of those who represented the broader interests. The American delegates were conspicuous at the conference in this, and still more in the thoroughness of their intelligence, and the humanitarian scope of their aims.

The report of this monetary conference, prepared by Mr. S. Dana Horton, secretary of the American delegation, forms vol. 5 of the executive documents of the United States, printed by order of the senate in the third session of the XLVth congress, 1878–79. In addition to the journal of the proceedings of the conference, and a collection of the monetary papers and statistical tables submitted by each delegation, it contains a large variety of relevant matter of English and American legislation on money, with classic treatises and reports on monetary questions. Besides these it republishes entire the proceedings of the first monetary conference held in Paris, June, 1867; the whole forming a volume of 918 pages.

MONETARY TREATY OF PARIS, 1865. See LATIN UNION.

MONEY, in political economy. This is a word in continual use all over the civilized world, and perhaps there is none the meaning of which in connection with the business they have in hand is more distinctly understood by those who use it; and yet, on the other hand, there is none of which it is more difficult to give a comprehensive account or a strict definition. Presuming, then, that every one knows the practical use of the word in the affairs of common life, the best thing to be done here will be to point out a few distinctions which may tend to obviate confusion in the comprehensive use of the term as an element in economic science.

Money is often spoken of loosely as the same thing with capital, but they are different. Before anything is money, it must be such that you can go into the market and immediately use it in purchasing commodities or paying debts. The plant of a railway and the machinery of a mill, so long at they are in full use, are capital, and are capital which probably has once been money—but they are money no longer, because you cannot use them in making payments, though they have perhaps become more valuable than ever they were. The confusion of capital with money was the mistake made in issuing the French assignats on the security of the forfeited landed estates. Each assignat was a promise to pay; but when payment was demanded, it could not be made, because land was not a medium for making it. It is of the essence of money, then, that it is capable of making immediate payment either to satisfy a seller or a creditor. But an article may be money though it will not satisfy everbody; and articles available as money—even those most universally accepted as such—are available for other purposes. What we are familiar with as the most approved form of money—as the thing that will be most certainly received in payment all over the world—is coin of the precious metals. The reason why the claim of these is so universally accepted is, that they do not merely represent value, as we shall find other kinds of money do, but they really are value. If the dealer sells a hat for a sovereign, he knows that the sovereign does not depend, like a pound note, on the solvency of the issuer, but that it has got value put into it by costing about as much labor and skill in bringing it into existence as the hat he gives for it. But even all coins perfectly available for money are not of the intrinsic value of their denomination. The silver for making 20 shillings is a good deal less valuable as a commodity than the gold in a sovereign; and in the same way, 240 pence, which are as money equal to a sovereign, only make a percentage of it in value as merchandize. The convenience of their use for small transactions makes up for depreciation in value of coins of the inferior metals, when gold is a standard, and to prevent incidental abuses, the law limits the extent to which they are a legal tender as good money.

Money transactions are distinguished from barter, in which one commodity is transferred for another, as where the shepherd, in primitive times may be supposed to have given the agriculturist a sheep for a measure of corn. This distinction is extremely useful, since the invention of a circulating medium, which supersedes the narrow, cumbrous process of barter, by facilitating transactions of every variety of importance among all sorts of people, is a grand type of advance in civilization. Like many other distinctions, however, it has not an absolute line of demarkation. The precious metals hold their value by their being commodities as well as being money, and coins are frequently used up for plate and jewelry. Where money is only available within one narrow region its use verges on barter. In central Africa, purchases are made and debts paid by strings of beads or coils of brass wire. An ivory merchant or a traveler will lay in a stock of these, just as in Europe he would carry gold or circular notes. They are commodities, being used as ornaments by the inhabitants. But they are distributed to an extent far beyond the demand in this shape, and that they absolutely constitute money is shown by this peculiarity in the case of beads, that a particular color will pass current, and another will not; so that the merchant who chooses the wrong kind, though he have full value in merchandize, has not taken with him a supply of available cash.

Under the head of Bullion, it is shown how the precious metals are an expensive form of money, which there is a temptation to supersede by paper money. For the various opinions adopted by different classes of economists on paper money, and the devices for getting over the great difficulty of rendering this kind of money secure, and equal in value to bullion, reference is made to the article CURRENCY. It may here be proper to state, that paper money, or money founded on credit—one of the resources of advanced civilization and complicated commerce—introduces a class of moneys so extensive and various, that it is impossible to mark the limits of its extent, or enumerate the shapes it may take. An attempt has been made to get rid of all difficulties by saying that a prom-

ise to pay is only the representative of money. But if it serve the purpose of buying or paying debt, it really is money. No one hesitates in counting a £5 Bank of England note as money. But a check by a person known to have a balance or credit at a solvent bank, is equally money; and though it is an order to pay, no actual bullion need ever be given for it, for the payment may be in notes, or the holder may hand it over to his own banker, in whose accounts it will be credited to the holder, and debited against the banker on whom it is drawn. The special difficulty as to paper money is, that it may be mistaken for money when it is none, as in the case of a check not honored by payment; or, that it may be of less intrinsic value than it professes to be, as when there is what is called an over-issue (see CURRENCY). There are thus great risks attached to the use of paper money; but there are also risks specially applicable to bullion money, as light weight, base coin, and the absence of those facilities for detection in theft or fraud, which are among the advantages of paper money. The special risks attending the use of paper have been shown in practice to be so capable of remedy by legislative precautions, that at present, in Scotland, one-pound notes are taken with less suspicion than sovereigns. On transactions in general, the chance of loss from forgery or insolvency is deemed less than the chances from light weight, even if the risk of base coinage should not come into consideration.

Making allowance for coins sent abroad or used as metal, the money of Britain is calculated at: gold, £75,000,000; silver and copper, £13,000,000; and notes, £42,000,000—in all, £130,000,000. But so large is the extent of paper money, in the shape of drafts and bills, that of these payments, to the extent of more than £2,000,000,000 in a year are settled at the London clearing-houses, or the establishments where the London banks, and those dealing with them, clear off their mutual obligations by paying over the balances.

*MONEY (*ante*). Originally, those substances in nature or of art which commerce among men proved to have the most general uniformity of value and convenience in use as measures of exchange of other commodities; which substances, being confirmed in such use, in civilized countries, by laws making them the sole legal tender as money, derive an increased, more certain, and more uniform value by reason of such legal confirmation of their sovereign use.

The laws pertaining to coinage formerly made by kings or ministers have been known in all ages to place in their hands a prodigious power for good or harm to their people. Since coined money has been largely displaced in modern times by legally authorized paper representatives of money, which have become *de facto* the principal actual money of all highly civilized peoples, and since this paper money is governed, like coin money, by the dominant law of convenience in use—as well as by the enacted laws of its confirmation, limitations, and powers as money—legislation pertaining to it has even greater power to promote or to destroy the prosperity of a people than when coin alone was the sport of kings. The laws which control the qualities or quantities of money, whether of coin or paper, have an influence on the public weal, vast and sudden beyond those enacted on any other subject. They strike at once every material interest of every citizen of the country which is subject to the laws. The examples of France and Germany, between 1871 and 1881, have furnished conspicuous illustrations of the helpful and hurtful power of legislation alone on money. It is especially within the present century, in Europe and in the United States, that all classes have realized this potency of legislation on money. The slightest modification of national laws concerning it affects every branch of trade, every industry, every investment. Yet a small number of the whole people, those whose business it is to deal in money as lenders or bankers, alone keep that close watch of legislation which enables them to control it unduly; so as to promote their own interests when laws are changed; or, if laws are likely to affect their interests injuriously, they are the first to be aware of the effects of changes and to guard against them. That prosperity or adversity may result to a majority of an entire people by a simple act of legislation on money, with a rapidity and a certainty that legislation on no other subject can parallel, has become obvious to all intelligent people. In England, 60 years ago, this subject attracted the observation of great numbers of able writers. But the legislation followed the interest of the moneyed powers, to the injury of the commercial and industrial classes. In France the philosophy of money, and the delicate nature of legislation on money, have called out the highest ability in its consideration for more than a hundred years. After the German war its financial administration was in the hands of Leon Say, son of a philosophic and practical financier and grandson of J. B. Say, whose works on political economy are authority to this day. Yet these men are only atoms in the mass of thought that has been given to this subject in France; whose present financial position is in part the result of its wisdom in money legislation.

The first American money that history informs us of was wampum and the dried cod-fish of Newfoundland. The latter were in general use as money, and answered the purpose better than any other material that could have been procured in that region. A single fish was a sufficiently small change for small transactions, and a mass of them not too cumbersome for the purchase of anything a barbarian would be likely to want. Only acquired by labor, easily preserved and transported, at all times useful to tribes away from the sea-shore, and exchangeable for what they had which the sea-shore

Indians had not, its superior convenience to any other one commodity made its adoption for money natural. On the Atlantic coast south of Massachusetts another form of money of a higher type was found among the Indians. This consisted of small shells strung like beads. They were of two kinds, white and black. The white was the periwinkle; the black was made with more labor out of the black part of a clam-shell, and was double the value of the white. Strings, groups of strings, and belts made of them were the money known as wampum. Not common enough to be found *ad libitum* and therefore representing labor in the acquisition; having the value of prettiness, lightness, divisibility by count, by strings, by belts,—this wampum was one of the most complete money measures known among barbarous nations. In the early days of the colonies, when coin money was scarce, wampum was adopted and used to great advantage in trading not only with the Indians, but among the colonists themselves. It will be seen that the sea-shore Indians had the advantage of the interior Indians in the manufacture of this money, and could buy furs, corn, and feathers probably with less labor in procuring wampum than the latter had in procuring these articles. Wampum was made a legal tender in the Massachusetts colony for 12d. only. A belt of it was 6 ft. long, and consisted of 360 beads. A white belt in Massachusetts in the early time of its settlement was the equivalent of 5s. worth of furs, and a black belt of 10s. worth. Three beads of the black and six of the white were equal to one penny. The value of this money was, after a time, seriously deranged by "an inflation" caused by the importation of beads. The Indians, seeing their superior beauty and ignorant of the illimitable quantity of them, made exchanges to great disadvantage with the whites who imported the beads by the barrel.

In 1641, in the Plymouth colony, corn was made a legal tender for the payment of debts, "to save the debtor from the inequity of forcing him to great sacrifices in consequence of the scarcity of the money of the realm." About 1650 the exports of Massachusetts were bringing in returns of gold and silver Spanish coins. In 1652 a mint was set up in Boston to make a set of coins for home circulation, and the colonists made laws to impede the circulation of Spanish coins in order to drive them to the mint; thus recognizing, what every nation sooner or later learns, that for domestic exchanges a non-exportable currency is desirable. For some time later the lack of any sufficient recognized money in the New England colonies caused the tax collectors to be authorized to receive corn, cattle, furs, and lumber for taxes, and the local authorities were obliged to furnish accommodation for these commodities; but "lank cattle" were refused. In 1655 wampum was still received for taxes at the rate of six shells to the penny, and the limitation to 12d. as legal tender does not seem to have applied to taxes. In 1675 it was ordered by the Massachusetts colonial council that "instead of transporting barter payments of taxes to and from the treasury, the transfers should be made by paper orders." In 1686 a bank of issue sprang into existence and soon went out. The mint was discontinued in 1688. In 1690 the colony issued notes for about one-seventh of the debt contracted by a disastrous expedition against the French in Canada, and made them receivable for taxes and for goods paid into the treasury for taxes. In 1692 a premium of 5 per cent over coin was allowed at the colonial treasury for these bills, and they remained at par for 20 years.

In Connecticut about this time different kinds of money were scaled in payments. Plain "pay" was barter at the government rates. "Money" was Spanish or New England coin and wampum for change; 12d. "pay" equaled 6*d*. "money." After 1700 Massachusetts issued paper money to a moderate extent. It was received for taxes and held at par with coin. In 1709 to 1711 Massachusetts, New Hampshire, Rhode Island, Connecticut, New York, and New Jersey joined in an expedition against Canada. The first colony increased its paper money moderately, and Rhode Island immoderately, and lengthened the term for its payment. The arts of banking were at this time engaging the attention of schemers the world over. John Coleman in Boston proposed a plan to issue notes on land security. The council did not permit him, but did itself in 1715 "bank," that is, issue, £30,000 of notes payable in coin in 10 years. The time of payment was deferred as the term approached. In 1721 another "bank" of money was issued, drawing interest to the government, payable in hemp or flax.

In 1723 Pennsylvania authorized the issue of colonial paper money to the amount of £15,000, to be apportioned among its counties according to the amount of their taxable property, and to be loaned by the county commissioners for 16 years at 5 per cent interest, and one-sixteenth of the principal, annually. Notes paid back during the first ten years were to be loaned again for the remainder of the period. In 1729, when Benjamin Franklin commenced the publication of his first newspaper, the question of an additional issue was being discussed. About 40 years afterwards Franklin, in his autobiography, thus alludes to the subject: "About this time there was a cry among the people for more paper money; only £15,000 being extant in the province, and that soon to be sunk. The wealthy inhabitants opposed any addition, being against all paper currency, from the apprehension that it would depreciate, as it had done in New England, to the injury of all creditors. We had discussed this point in our junta, where I was on the side of an addition; being persuaded that the first small sum struck in 1723 had done much good by increasing the trade, employment, and number of inhabitants in the province; since I now saw all the old houses inhabited, and many new ones building;

whereas I remembered well, when I first walked about the streets of Philadelphia, eating my roll, I saw many of the houses in Walnut street between Second and Front streets, with bills on their doors "to be let," which made me think the inhabitants of the city were one after another deserting it. Our debates possessed me so full of the subject that I wrote and printed an anonymous pamphlet entitled *The Nature and Necessity of a Paper Currency.* The utility of this currency became by time and experience so evident, that the principles upon which it was founded were never afterwards much disputed; so that it grew soon to £55,000; and in 1739 to £80,000; trade, building, and inhabitants all the while increasing. Though I now think there are limits beyond which the quantity may be hurtful" (Spark's Franklin, vol. i, pp. 90–92).

About 1720 the commissioners of the New England colonies became alarmed at the tendency to further increase of paper notes for money, and recommended its stop. The English parliament forbade banking except under its charter, and forbade the colonial governments from emitting bills. Later the restriction was modified to permit an issue for government expenses only. In 1739 a "land bank" was set in operation in Philadelphia, which loaned its notes for 3 per cent per annum interest, and 5 per cent in principal, *both payable in merchandise.* This is one of the first American examples of the fertile banking which secures a payment of merchandise for the loan of a debt. This bank became a strong factor in politics, and as fortunes were to be made through it by the managers without any capital risked by them, they could afford to agitate energetically. "The land bank," says Sumner, "resisted its fate by social and political intrigues." In 1740 parliament required its wind up, but it managed to evade the requirement. The history of the shifts made use of to take up, to pay, and to re-issue paper money in Massachusetts and the other New England colonies for the next 30 years, is simply the example of how legislation, controlled first by men with one interest, and then by men of another interest, without any philosophic, disinterested statesmanship to harmonize conflicting interests, can keep up a financial agitation injurious to all parties. The history of the colonial paper money issues of Pennsylvania, on the other hand, which started on a more sound and philosophic basis, is much more satisfactory; and although in the end the original chart was lost sight of, the benefits far outweighed the injury resulting from their excesses.

At the beginning of the revolution the Continental congress issued its note money in addition to that which the colonies separately had already issued, and were continuing to issue under different laws and with various degrees of prudence. The first joint or "continental" issue was in Aug., 1775, for 300,000 Spanish dollars, payable in three years. Other issues followed rapidly. These notes generally passed at par with gold and silver until the latter part of 1776, when their amount reached $20,064,000. The following table condensed from Gouge's *History of Continental Money,* gives the issues and depreciation:

Amount issued up to, and inclusive of the year—

	1776	$20,064,464	Rate of exchange for gold or silver	Jan. 1,	1777	1¼	for 1
Added in	1777	26,426,333		"	1778	4	"
"	1778	66,965,269	" "	"	1779	9	"
"	1779	149,703,856	" "	"	1780	45	"
"	1780	82,908,320	" "	"	1781	100	"
"	1781	11,408,095	" "	"	1782	500	"
Total		$357,476,541					

The French alliance in 1779 enabled congress to borrow money, and it attempted to limit the outstanding issues of paper money to $200,000,000, but did not. The loss of value of the entire issue became complete in 1781, and having been gradual as it passed from hand to hand through several years came to be regarded in the light of an involuntary tax for the maintenance of the war, which in general had fallen severely on people according to their means, though in cases it produced shameful wrongs. But, says Phillips, "if it saved the state it also polluted the equity of our laws."

In Jan., 1782, the bank of North America, chartered with a capital of $400,000, opened in Philadelphia. It was a private bank, having the confidence and support of the Continental congress. $70,000 in specie were put into its capital by citizens, and the remainder by the government in specie or foreign exchange out of a foreign loan. The bank had its origin in a union of Philadelphia citizens to supply the army. They issued the bank's notes in pay for them. Gouge, in his *History of Paper Money and Banking in the U. S.*, published in 1833, shows that it was a mistake to suppose that that bank aided the government; as its stockholders only paid in $70,000, or seven-fortieths of its capital. The government deposited $254,000, and was credited by Robert Morris with that amount of stock in the bank. The individual directors thus acquired the power to circulate $400,000 in the bank's notes, and loaned the government and others their own money and the $400,000 additional money which the government's deposits and sanction soon made current at par. The dividends were soon from 12 to 16 per cent for the stockholders, with fat livings for the organizers. "In 1785," says Gouge, "the effects of its operation began to be apparent. A temporary plentifulness of money, followed

by great scarcity, usury, ruin to the many, riches to the few." In 1785 the Pennsylvania legislature repealed the bank's charter, but it continued operations by virtue of the congressional charter, and managed to get a renewal afterwards from the state by means of its great monetary influence. From the beginning of 1780 till the close of the war hard money is said to have been plenty; caused by considerable sums disbursed by the French and British armies, by the loan made to the government, and by commerce with the West Indies. France spent $3,000,000 in specie to meet her army and navy expenses, besides what came through her as loans. Such was the flux of specie to America then that in both France and England the drain was seriously felt.

In 1787 the clause in the new federal constitution that no state "shall coin money, emit bills of credit, or make anything but gold or silver coin a tender in payment of debts" would seem to have forever barred a state, not only from issuing bills of credit, but from giving charters to banks of issue; as it seems absurd that a state legislature may delegate a power to private corporations which the constitution has denied to the state itself. But the profits of the bank of North America in Philadelphia had stimulated banking; Massachusetts, New York, and Maryland gave charters to banks which the U. S. courts did not abrogate. The system of state banks thus begun did not terminate till congress wrestled with the subject and suppressed them during the great rebellion. In 1791 congress chartered the first U. S. bank. See NATIONAL BANKS and PAPER MONEY OF THE UNITED STATES. About 60 state bank charters were issued prior to 1800. Their subsequent increase and separate history in each state is without the pale of this article.

THE UNIT OF VALUE AND COINAGE LAWS OF THE UNITED STATES. In 1785 congress adopted the silver dollar as the *unit of money*. On April 2, 1792, in the law establishing a mint, it enacted that "The money of the United States shall be expressed in dollars or units;" the dollar "to be of the value of a Spanish milled dollar as the same is now current," and to contain 371¼ grains of pure silver. The same act fixed the weight of the gold eagle at $247\frac{5}{10}$ grains, or $24\frac{75}{100}$ grains to the dollar, which made the ratio of value of silver to gold, by weight, as one to fifteen. In 1834 the weight of pure gold in the eagle was reduced to 232 grains, no change being made in the weight or fineness of the silver-unit dollar. This made an ounce in gold equal as a legal tender to 16.045 oz. of silver, thus increasing the legal value of the previous coinage of U. S. gold coins nearly 7 per cent. In 1837 the composition of both the gold and silver coinage was changed, but the dollar retained the same quantity of pure silver, while the quantity of pure gold in the eagle was increased to $232\frac{2}{10}$ grains, so that the legal equivalency of gold to silver by weight was 15.988 of silver to 1 of gold. That has been the legal relationship of U. S. coins of the two metals to the present time. The quantity of pure silver in the unit dollar of the United States has remained unchanged since its adoption in 1785 and its confirmation by the coinage act of 1792. The weight of the gold eagle has been changed twice. While the legal value of silver to gold was as 1 to 15, gold was at a premium, and disappeared from circulation to pay foreign debts, as it would pay more than at home. After the ratio of 16 to 1, made by the law of 1834, until 1874, the silver dollar bore a premium over the gold dollar in the London market of from 1 to 3 per cent. Silver in consequence became scarcer, but did not entirely disappear, as gold would have done under the same condition, on account of its indispensableness for small change and the greater expense of its shipment. But to counteract the tendency to its export in consequence of its under-valuation relatively to gold, congress found it necessary to pass the act of Feb. 21, 1853, reducing the old proportion of pure silver in coins smaller than the dollar, and limiting the amount of these that could be used as legal tender to five dollars. Before that time no silver coin except the 3-cent piece was below the standard fineness of the silver-unit dollar. This act retained in the country all the small coins minted by the United States; but the standard silver dollars, being exported as fast as made, were coined less and less.

Soon after the breaking out of the rebellion in 1861, the U. S. government was obliged to provide money for carrying on the war on a scale gigantic compared with what had previously been known; and during the four succeeding years had recourse to the issue of U. S. legal tender notes and bonds for that purpose, and the organization of the U. S. national bank system. The history of the monetary legislation of this period, and the subsequent legislation that resulted from it, will be found under the heads—BANKS and BANKING, and DEBT, NATIONAL. Also, see GREENBACKS.

We now resume the history of recent legislation pertaining to metallic money.

The act of Feb. 12, 1873, now known as the demonetizing act, was one of 67 sections, matured in committee and presented to congress as an act to regulate the details of coinage at the mint. It was presumed to collate and embrace in one act all previous legislation on the subject of U.S. money. It did not demonetize the standard silver dollar. It did not make anything else the unit of value. But it only authorized the coinage of silver into half and quarter dollars and dimes (according to the reduced standard of 1853), and into a trade dollar above the standard of the unit dollar; and prohibited these coins from being a legal tender for more than five dollars in any one payment. The act contained no change in the old unit dollar. It simply omitted to mention it as one of the coins to be made at the mint, and practically accomplished its demonetization by the following words in "Sec. 17. No coins either of gold, silver, or minor coinage,

shall hereafter be issued from the mint, other than those of the denominations, standards, and weights, herein set forth." This act which thus in effect, though not in terms, demonetized silver, except for small change, was not generally known to have that effect until two or three years after its passage. Eminent and careful statesmen of both houses of congress then admitted frankly that the nature and effect of this part of the bill were a complete surprise to them. It was a part of a well concerted policy begun in Europe to bring about the single gold standard, but which inaugurated a revolution in money far more momentous in its consequences, than its supporters themselves had any conception of. See MONETARY COMMISSION, CONGRESSIONAL, 1876; and MONETARY CONFERENCE, PARIS, 1878. The legislation in congress to complete the demonetization of silver was closed by these words in section 3,586 of the revised statutes: "The silver coins of the United States shall be a legal tender at their nominal value for any amount not exceeding five dollars in any one payment." Thus the stop of coinage of silver dollars by the act of Feb., 1873, was phrased in the revised statutes so as to destroy the legal tender of the silver dollar without any act having been passed to that purport. In the language of the report of the joint monetary commission of the 44th congress appointed Aug. 15, 1876, "the ancient money of the country, instead of being intentionally legislated out of existence by congress, was revised out of existence." The main reason given in congress at the time of the passage of the coinage act for ceasing to coin the silver dollar, was that its value was 3 per cent above the standard for a gold dollar. It was "standing guard against a rise in gold." The following is a copy of the provisions of the revised statutes down to Mar. 4, 1875, concerning all forms of legal tender money then recognized:—

"Sec. 3,584. No foreign gold or silver coins shall be a legal tender in payment of debts.

"Sec. 3,585. The gold coins of the United States shall be a legal tender at their nominal value when not below the standard weight and limit of tolerance provided by law for the single piece, and when reduced in weight below such standard and tolerance, shall be a legal tender at valuation in proportion to their actual weight.

"Sec. 3,586. The silver coins of the United States shall be a legal tender at their nominal value for any amount not exceeding five dollars in any one payment.

"Sec. 3,587. The minor coins of the United States shall be a legal tender at their nominal value for any amount not exceeding 25 cents in any one payment.

"Sec. 3,588. United States notes shall be lawful money, and a legal tender in payment of all debts public, and private, within the United States except for duties on imports and interest on the public debt.

"Sec. 3,589. Demand treasury notes authorized by the act of July 17, 1861, chap. 5, and the act of Feb. 12, 1862, chap. 20, shall be lawful money and a legal tender in like manner as U.S. notes.

"Sec. 3,590. Treasury notes issued under the authority of the acts of Mar. 3, 1863, chap. 73, and June 30, 1864, chap. 172, shall be legal tender to the same extent as U.S. notes, for their face value, excluding interest: *Provided*, That treasury notes issued under the act last named shall not be a legal tender in payment or redemption of any notes issued by any bank, banking association, or banker, calculated or intended to circulate as money.

At the end of 1874 certain sagacious minds became aware of the concerted action among great holders of government securities in Europe and the United States to procure the entire demonetization of silver, and the general adoption of the gold unit of value; and sounded the alarm that so great a revolution as the entire suppression of the money function of one half the money of the world ought to awaken. The more the subject was thought of, the greater seemed the impending danger, so that when the subject came up for discussion in the 45th congress it absorbed public attention more than any other. The exhaustive debates in the press and in congress on an act, known as the Allison bill, entitled "*An act to authorize the coinage of the standard silver dollar, and to restore its legal tender character,*" resulted in a vote in the house of representatives, passing the bill by a majority of more than three to one, without division by party lines. President Hayes vetoed the bill, and congress promptly repassed it on Feb. 28, 1878, by a vote of 46 yeas to 19 nays in the senate, and 196 yeas to 73 nays in the house. It forms chap. 20 of the acts of the 45th congress. Sec. 1. provides for the coinage of the original silver dollar of the same weight, fineness, devices, and superscriptions, required by the act of 1837; that it, and all previously coined silver dollars of the United States shall be a legal tender at their nominal value, for all debts and dues public and private except where otherwise expressly stipulated in the contract; that the secretary of the treasury is authorized and directed to purchase from time to time, silver bullion, at the market price thereof, not less than $2,000,000 worth per month, and cause the same to be coined monthly, as fast as so purchased into such dollars, "provided that the amount of money at any one time invested in such silver bullion, exclusive of such resulting coin, shall not exceed $5,000,000; and provided further, that nothing in the act shall be construed to authorize the payment in silver, of certificates of deposit issued under the provisions of sec. 254. of the revised statutes," Sec, 2. provides that the president after the passage of the act shall invite the countries composing the Latin union, so called, and other European governments to join the United States in a conference "to adopt a common ratio between gold and silver, for the purpose of establishing internationally,

the use of bi-metallic money," to which conference he should appoint three commissioners. See MONETARY CONFERENCE, PARIS, 1878. Sec. 3. provides that "any holder of the coin authorized by this act may deposit the same with the treasurer or any assistant treasurer of the United States, in sums not less than ten dollars, and receive therefor certificates of not less than ten dollars each, corresponding with the denominations of the U.S. notes. The coin deposited for, or representing, the certificates shall be retained in the treasury for the payment of the same on demand. Said certificates shall be receivable for customs, taxes, and all public dues, and, when so received may be re-issued."

The total product of the United States mints in coins of gold and silver and baser metals from 1793 to 1884, inclusive, is here given :

Year.	Gold.	Silver.	Small Coins, Alloy.
Prior to 1877	$939,081,495	$180,322,374	$12,822,538
1877	44,079,199	28,549,935	62,125
1878	52,798,980	28,290,825	30,694
1879	40,986,912	27,227,882	97,798
1880	56,157,735	27,942,437	269,971
1881	78,733,864	27,649,966	465,109
1882	89,413,447	27,783,388	644,757
1883	35,936,927	28,835,470	1,428,307
1884	27,932,824	28,773,387	1,174,709
Each Total	$1,365,121,383	$405,378,664	$16,936,008

Total United States coinage for 91 years $1,787,436,055

Secretary Folger in the treasury report for 1884, estimates :

The gold coin and bullion in the United States, Nov. 1, 1884..	$585,611,872
The silver " " " " " ..	275,735,439
Total specie in circulation, in banks and treasury of U. S.....	$861,347,311
United States notes (greenbacks) outstanding, Nov. 1, 1884...	$346,681,016
National bank notes " " ...	333,559,813
Total paper money authorized by national legislation	$680,240,829

There was held in the U. S. treasury at the above date, mostly in gold and silver coin and bullion, $311,590,769. Deducting this from Mr. Sherman's estimate of the total specie in the country, it would leave a balance of about $549,746,542, to be divided between bank reserves and circulation. This is believed to be an over estimate. It is probable that the amount of specie in actual circulation, together with the paper currency of the country, amounted in 1880 to very near $1,000,000,000, or $20 per head of the population. The following table gives the currency statistics of the United States for the past 15 years. No estimate is made of the gold and silver coin in circulation between 1865 and 1877, as it was scarcely used during that time except at the custom houses and in California. The amount in use was probably under $50,000,000.

MONEY IN THE UNITED STATES FROM 1870 TO 1884, INCLUSIVE.

Year.	United States Issues.			Notes of National Banks including Gold Notes.	Coin in Circulation Estimated.	Aggregate.

The table, showing the relative money circulation of the several countries at the same date, is useful for ascertaining their average condition financially, and indicates their wealth and their financial policy. The comparison between the relative wealth of Russia and Switzerland is curious. The ratio of currency per capita varies far more among nations than has generally been supposed; and although in general the countries having the most accumulated wealth have the greatest ratio of money in circulation, the proportion is not uniform; and the proportion of the whole currency of each, to the amount of gold and silver that each controls, is not apparently subject to any law. The table would seem to lead to the conclusion that the most intelligent and active commercial nations use the most per capita. This would certainly be true where business is principally conducted on the cash system.

Persons desirous of studying money questions will find the most complete list of works to choose from in the appendix to vol. 5. of the executive documents of the 3d session of the 45th congress, being the report of the commission appointed to represent the United States in the monetary conference in Paris in 1878. The books and pamphlets are there arranged in chronological order down to the beginning of 1879. A large part of the most valuable literature on the subject is in the form of pamphlets. Among the most instructive of recent books the following is a selected list of those in the English language: *Money and Trade*, 1879, by prof. Francis A. Walker of N. Y.; John Sherman's *Speeches and Reports on Financial Questions*, 1 vol., 1879; *Silver and Gold*, 1876, and *The Monetary Situation*, 1878, both by S. Dana Horton of Cincinnati; *Gold and Debt*, W. L. Fawcett, Chicago, 1877; *The Money Question*, by W. A. Berkey, Grand Rapids, Mich., 1876; Senate document, *Report of the Monetary joint committee of Congress in* 1877; *Report of the Paris Monetary Commission of* 1878, just mentioned. These government reports are compendiums of facts and opinions of great value. Sumner's *History of American Currency* is a racy sketch, but crude in its reflections. *Money and the Mechanism of Exchange*, by W. S. Jevons of London, is one of the high authorities on money in connection with banking. The most valuable old work on "Paper-money and Banking in the United States" is that of Wm. M. Gouge, Philadelphia, 1833. Kellogg's *New Monetary System*, 1837, is a remarkable elaboration of speculative philosophy concerning money. *The Ways and Means of Payment*, by Stephen Colwell, Philadelphia, 1859, is an analytic treatment of money and credit of high value.

For practical elucidations of the money questions of the day, the works of French writers are among the clearest. The following are eminent: Henry Cernuschi, Emile de Lavaleye, M. Leon Say, Victor Bonnet, M. Chevalier, E. de Parieu. Of modern British authors, Walter Bagehot, W. T. Thornton, Stephen Williamson, Ernest Seyd, W. Stanley Jevons, John Stuart Mill; and of old writers bishop Berkeley and Adam Smith are classic authorities on various sides of money questions. C. Feer Herzog, of Switzerland, is the great champion of a single gold standard. His works are published both in French and German. Count Charles Rusconi is an eminent Italian monetary statesman and writer. See *Supp.*, page 882.

MONEY, HERNANDO DE SOTO. See page 882.

MONGE, GASPARD, Comte de Péluse, a French mathematician and physicist, was b. of humble parentage at Beaune, in the department of Côte d'Or, May 10, 1746. When only fifteen, he went to study natural philosophy at the oratorian college of Lyons, and afterwards obtained admission into the famous artillery school at Mézières, where he invented the method known as "descriptive geometry," which was at first received with incredulity, but afterwards with avidity, and, for a time, jealously kept secret by the military authorities. In 1772 Monge became tutor and professor at Mézières; in 1780 he was chosen a member of the French academy; and in the same year was called to Paris as professor of hydrodynamics at the Louvre. As a lecturer, he was precise, clear, and brief; his style was a model of scientific rigor, if not of literary elegance. During the heat of the revolution, he became minister of marine, but after a few months resigned

the office. He did not, however, retire into obscurity, but took charge of the great manufactories improvised for supplying the million of soldiers whom republican France had lanched against her enemies, with arms and gunpowder. At this critical period, he showed himself possessed of a genius equal to the occasion. He was everywhere, animating, ordering, counseling, and directing the patriotic artisans. Yet it is characteristic of the insane fanaticism that, for a time, got the upper hand in France, that Monge himself only escaped the guillotine on account of his services being absolutely indispensable. After he had founded the *ecole polytechnique*, he was sent by the directory to Italy, and intrusted with the transport of the artistic spoils of the republican armies. Here he formed a close friendship with Bonaparte, whom he followed to Egypt. He now undertook the management of the Egyptian institute. During the expedition to Syria, he performed the greatest services to the government established at Alexandria. On his return to France, he resumed his functions as professor in the ecole polytechnique, and, though his reverence for Napoleon continued unabated, he hotly opposed his aristocratic and dynastic views. The title of comte de Péluse (Pelusium) was conferred on him by Napoleon, in memory of the Egyptian expedition. He died July 28, 1818. Monge's principal works are: *Traité Elémentaire de Statique* (7th edit. Paris, 1834); *Leçons de Géométrie Descriptive* (6th edit. Paris, 1837); and *Application de l'Analyse à la Géométrie des Surfaces du 1 et du 2 Dégré* (4th edit. Paris, 1809). See Dupin's *Essai Historique sur les Services et les Travaux Scientifiques de Monge* (Paris, 1819).

MONGHYR', a city of India, capital of a district of the same name, is situated on the right bank of the Ganges, 30 m. w.n.w. of Bhagulpur. It is a large and thriving town, and carries on extensive manufactures of hardware and fire-arms, which, however, are of very inferior quality. Owing to the salubrity of its climate, it is a favorite residence of invalided military men and their families. Pop. '81, 55,372. The district has an area of 3,913 sq.m., with a pop. of 1,812,986. Monghyr is on the line of the East Indian railway.

MONGOLIA (Mongols, *ante*), "the country of the Mongols," comprises a vast extent of territory in the interior of Asia, and forms a part of the Chinese empire. It extends over an area of 1,200,000 sq.m., between lat. 37° and 54° n., and 85° and 125° e. long., and is bounded on the n. by Siberia, e. by Mantchooria, s. by China proper, and w. by e. Turkistan and Dzungari; pop. 2,500,000, of whom 500,000 are Chinese. It is more than 1700 m. in length; its width, from n. to s., varying between 600 and 1000 miles. For the most part it is a high table-land, 3,000 ft. above the level of the sea, arid, without running water, and without important vegetation. The central portion is the great desert of Gobi, extending s.w. and n.e., from the boundary-line of the province of Kansu to the Dalai Nor, near the boundary of Dauria, having an average width of 200 miles. This is the worst part of the country, the surface being covered with sand and stones, and the vegetation scanty and occasional. Vast tracts are level; but, at great distances from each other, there are hills of moderate elevation. The entire region is destitute of trees, and the water, which is only found at some distance below the surface, is brackish. South-east of the Gobi extends a more elevated and uneven country, terminating in a mountain range of considerable height. This range, the Alashan or Ho-lang Shan, begins near the most southern point of Mongolia, near the banks of the river Hoang-ho, and extends northward along that river nearly 400 miles. Near 42° n. lat. it turns abruptly to the e., forming nearly a right angle, and continues in this direction about 600 m., being now under the name of Inshan. It finally proceeds in a n.e. direction from 42° to 55°. Its highest point has an elevation of more than 15,000 ft. above the sea. The country skirting this range is unfit for agriculture, and is only used as pasture-ground. South of the Inshan mountains there are fertile valleys and mountains partly wooded. To the e., and extending to the Yellow sea, is a narrow tract of fertile land. And southward, again, the country contains numerous meadows clothed with rich grass, where agriculture has been introduced by the Chinese, who send thither criminals who have been condemned to transportation. The most southern district is the haunt of wild animals, including tigers and leopards, and is the hunting-ground of the Chinese. It contains the palace of Ichol, which was described by sir George Staunton. The country which extends along the n.w. side of the desert of Gobi is little known, with the exception of the e. part, which is traversed by the caravan road from Kiachta in Siberia to Khalgan in China. Here the surface of the country is frequently broken by hills and isolated ridges; but the intervening level tracts contain rich pasture-ground. It is mostly well watered, but wood is scarce. In advancing northward the hills are higher, and the valleys, or intervening tracts, grow narrower, till near the boundary-line between Mongolia and Siberia the country rises into mountains, which run in a continuous chain, and are a portion of the Altai mountains. Here originate the principal rivers of Mongolia, the Selenga and its numerous upper branches; the Kerlon and the Onon, which, by their union, form the Amur. This country is rich when compared with the other parts of Mongolia. The western part of Mongolia is traversed by a mountain range, which, near its w. extremity, is connected with the Altai mountains not far from the e. bank of the Irtish. That portion of the country which lies s. of this range seems to partake largely of the nature of the Gobi, extending mostly in sterile plains. The Irtish is the largest river in this country, and runs about 160 m. before it falls into lake Zaizan.

The climate of the whole of Mongolia is generally cold, though it is subject to sudden changes, and in summer is insupportably hot. The snow-fall, however, is very light. The wealth of the Mongols consists in their numerous herds of cattle (on the more hilly tracts), camels, horses, and sheep. Wild animals are numerous, including hares, antelopes, wild asses, foxes, deer, sables, squirrels, and marmots. Water-fowl are plentiful in the lakes which abound in the n.w. part. The wolves are numerous and savage, attacking even the shepherds in preference to the sheep: there are also the brown and black bear, the yak, and the ounce. The double-humped or Bactrian camel is domesticated for its milk. It is remarked that in the southern portion, where the Chinese practice agriculture, the temperature has risen with the progress of cultivation of the soil, and that grain is now grown there, and ripens readily, which could not formerly be cultivated on account of the cold. The Mongols are generally nomadic, and live in tents. They have sometimes been curiously confounded with the Tartars, and Mongolia is called Tartary on many old maps. No two nations could physically be more distinct, though both are addicted to the same nomadic mode of life. The Tartars belong to the Turki race, from whom the European Turks are descended. The Mongol race, which is far more numerous than the Tartar, is dispersed over almost all the eastern countries of Asia, but it is to the restless hordes of middle Asia, and to the Buriates, Bashkirs, Kalmucks, and other roving tribes that the name of Mongols is chiefly restricted.

MONGOLS, the name of a numerous and widely spread branch of the human family—the second in the classification of Blumenbach, and corresponding in almost every respect with the branch designated as Turanian by more recent ethnologists. See TURANIANS. Under the designation of Mongols are included not only the Mongols proper, but the Chinese and Indo-Chinese, Thibetans, Tartars of all kinds, Burmese, Siamese, Japanese, Esquimaux, Samoieds, Finns, Lapps, Turks, and even Magyars. Collectively, they are the great nomadic people of the earth, as distinguished from the Aryans, Semites, and Hamites; and are the same who, in remote antiquity, founded what is called the "Median empire" in lower Chaldea, an empire, according to Rawlinson, that flourished and fell between about 2458 and 2234 B.C.; that is, before Nineveh became known as a great city. Thus early did some of these nomadic tribes, forsaking their original pastoral habits, assume the character of a nation. Another great offshoot from this stock founded an empire in China, the earliest date of which it is impossible to trace, but which certainly had reached a state of high civilization at least 2000 years B.C. In early Greek history they figure as Scythians, and in late Roman, as Huns, carrying terror and desolation over the civilized world. In the middle ages they appear as Mongols, Tartars, and Turks. In the beginning of the 13th c., Genghis-Khan (q.v.), originally the chief of a small Mongol horde, conquered almost the whole of central and eastern Asia. His sons and grandsons were equally successful, and in 1240–41, the Mongol empire extended from the sea-board of China to the frontiers of Germany and Poland, including Russia and Hungaria, and the whole of Asia, with the exception of Asia Minor, Arabia, India, and the Indo-Chinese states, and northern Siberia. This vast empire soon broke up into a number of independent kingdoms, from one of which, Turkistan, arose another tide of Mongol invasion under the guidance of Timour or Tamerlane, who, in the latter part of the 14th c., reduced Turkistan, Persia, Hindustan, Asia Minor, and Georgia under his sway, and broke, for a time, the Turkish power. On the death of his son Shah Rokh, the Mongol empire was subdivided, and finally absorbed by the Persians and Usbeks, but an offshoot of Timour's family founded, in the 16th c., the great Mogul empire of Delhi. After the decline of Timour's empire the Turkish branch maintained the glory of the race, and spread terror to the very heart of western Europe. In the 9th c. the Magyars, a tribe of Ugrians, also of Mongol extraction, under their leader Arpad, established themselves in Hungary, where, in process of time, they became converted to Christianity, and founded a kingdom famous in European history. See TURKS and HUNGARY.

The physical characteristics of the Mongols in their primitive state are thus described by Dr. Latham in his *Descriptive Ethnology:* "The face of the Mongolian is broad and flat. This is because the cheek-bones stand out laterally, and the nasal bones are depressed. The cheek-bones stand out *laterally.* They are not merely projecting, for this they might be without giving much breadth to the face, inasmuch as they might stand forward. . . . . The distance between the eyes is great, the eyes themselves being oblique, and their carunculæ being concealed. The eyebrows form a low and imperfect arch, black and scanty. The iris is dark, the cornea yellow. The complexion is tawny, the stature low. The ears are large, standing out from the head; the lips thick and fleshy rather than thin, the teeth somewhat oblique in their insertion, the forehead low and flat, and the hair lank and thin." Of course, such a description as this cannot be understood as applying to the more civilized nations of Mongol origin, such as the Turks and Magyars, especially the latter, who in physical appearance differ but little, if at all, from other European nations. See works on the M. by Howorth and Gilmour.

In religion, the Mongols are, for the most part, Buddhists. There are among them, however, according to the different countries in which they reside, various other religions, as Confucianism, Taouism, fire-worship, paganism of different kinds, Mohammedanism, and Christianity. The Mongol languages, which are very numerous, are described

by Dr Latham as being "aptotic and agglutinate, rarely with true amalgamate inflection." In 1859, according to an estimate formed by prof. Dieterici, the Mongols of all kinds amounted in number to as many as 528,000,000, or about half of the human race.

MONGOUS. See ICHNEUMON, *ante*.

MONHEGAN ISLAND, off the coast of Hancock, co., Maine. Pop. 145. The first account of it is by capt. John Smith. It has a stone light-house.

MONIMIA'CEÆ, a natural order of exogenous plants, consisting of trees and shrubs, with opposite leaves destitute of stipules; the bark and leaves having an aromatic fragrance. The flowers are unisexual. The perianth is somewhat globose, divided at the border sometimes into more rows than one. The stamens are numerous, and arise from and cover the whole interior of the tube of the perianth. There are several ovaries, each with one ovule. The fruit consists of several achænia, inclosed within the enlarged calyx. There are about 40 known species, natives chiefly of South America. A few are found in New Zealand and Australia. The fruit of the BOLDU (*boldoa fragrans*), a shrub or small tree, a native of Chili, is eaten. It is a little drupe, about the size of a currant, extremely fragrant when dried.

MONITA SECRETA SOCIETATIS JESU, secret instructions for the Jesuitic order, in a volume first published at Cracow, 1612, in Latin from the Spanish, by an unknown editor. It was then and afterwards regarded by scholars as the work of Claude Acquaviva, the general of the order, exercising over it complete control, and esteemed the ablest and most profound politician of his time. He did nothing to prove the book a forgery, and, so far as known, did not deny that he was the author. It continued unmolested until his death. In 1615 a commission was appointed to search out the author, but none was found. In the following year the book was placed in the Index. In 1633 Casper Schoppe, a German scholar, published an account of a book which had fallen into his hands, and which proved to be the same as the *Monita Privata*, but had been obtained from a source independent of the first. In the British museum there is a volume printed at Venice in 1596, which contains on several manuscript leaves, in writing of an ancient date, the whole of the *Monita Secreta*. In 1658, during Cromwell's administration, an edition of the book was printed in England. On the continent a French version was printed in 1661, and a second edition of Schopp's book in 1668. In 1669 Henry Compton, canon of Christ church, Oxford, published an edition found in MS. in a Jesuit's closet after his death, thus supplying an additional copy independent of all the others. In 1713 Henri de St. Ignace published the *Monita Secreta* in an appendix to his work on the necessity of reforming the order. This passed through four editions. In 1717 the book was published at Amsterdam, and in 1727 at Cologne. After the suppression of the order in 1773 several MSS. were found in their colleges and other resorts. In 1782 a MS. found in Rome was printed there, as was thought by the editor, for the first time. In 1831 an edition was published at Princeton, N. J., and in 1844 it was reprinted at New York. In the 17th c. Dr. Johann Gerhard referred to the book as undoubtedly genuine, and his opinion was indorsed by nearly all Protestant church historians. M. Gachard, a man of great learning and sagacity, whose critical investigations Prescott and Motley highly esteemed, says that at the suppression of the Jesuit order in the Netherlands there were discovered in one of their colleges some of their most important papers, among which were the *Monita Secreta;* that a translation of the book was made by order of government, and still exists in the archives of the kingdom. This, he testifies, differs in nothing that is material from that which has been made public. On the other hand, the eminent church historian Gieseler decided against the genuineness of the book; Isaac Taylor, in his article on the Jesuits, contained in the 8th edition of the *Encyclopædia Britannica*, says that the *Monita* is believed to be a spurious production; and prof. Schem, in the *Biblical Cyclopædia* of McClintock and Strong, says that the book was not written by a Jesuit, but is a satire.

MONITEAU, a co. in central Missouri, bounded n.e. by the Missouri river; drained by Saline, Moniteau, and Moreau creeks; 400 sq.m.; pop. 80, 14,349—13,376 of American birth. It is intersected by the Missouri Pacific railroad, and by a branch of the St. Louis, Kansas and Northern. The surface is rolling and broken; in great part covered with valuable forests. Indian corn, wheat, oats, and pork are the staples. Iron, lead, bituminous coal, and several varieties of limestone, used as building material, are found. There are several flourishing towns. Co. seat, California.

MONITEUR, LE, a celebrated French journal, started by the publisher, Charles Joseph Panckoucke, May 5, 1789, under the title of the *Gazette Nationale, ou le Moniteur Universel*. After the crisis of Aug. 10, 1792, its importance as a daily register of the events which occurred during the dark days of the revolution, immensely increased. Whoever wishes to obtain a complete view of the phenomena of the reign of terror, should consult Thuan-Grandville's *Gazette Nationale, ou le Moniteur Universel, commencé le 5th Mai*, 1789, *précédé d'une Introduction historique contenant un Abrégé des anciens Etats généraux, des Assemblées des Notables, et des principaux Evénements qui ont amené la Révolution* (1796). In 1800, it altered its form so far as to divide itself into two halves, of which the first contained the *actes du gouvernement*. This change imparted to the journal something of an official character. After Jan. 1, 1811, it dropped the title of

Gazette Nationale, retaining only that of *Moniteur Universel.* After the restoration, it became the government organ, which it continued to be until 1869, when its official connection was discontinued.

MONITOR, a name given to many species of saurian reptiles, nearly allied to the true lizards, from which they differ in having no teeth on the palate. Among them are some of large size, the largest of existing saurians except those of the crocodile tribe. The tail of the greater number is laterally compressed, the better to adapt them to aquatic habits. They receive the name monitor from a notion that they give warning by a hissing sound of the approach of a crocodile or alligator. For the same reason, some of the American species receive the French name *sauvegarde.* Those of the old world form the family *monitoridæ,* and those of America the family *teïdæ* of some naturalists. There are several genera of both.—The MONITOR or VARAN OF THE NILE (*M. Niloticus*) is of a rather slender form, and has a long tail. It is olive gray, mottled with black. It attains a length of five or six feet. Crocodiles' eggs form part of its food. The TEGUEXIN (*teius Teguexin*) of Brazil and Guiana is of similar size. It preys on aquatic animals. Other large species are plentiful in almost all tropical countries. They are powerful animals, have strong teeth, and defend themselves vigorously if attacked. Some comparatively small species, feeding chiefly on insects, are found in dry situations. Some of the large South American species are used for food.

MONITOR. See TURRET-SHIP.

MONITO'RIAL SYSTEM, or MUTUAL INSTRUCTION. It first occurred to Dr. Bell (q.v.), when superintendent of the orphan hospital, Madras, in 1795, to make use of the more advanced boys in the school to instruct the younger pupils. These youthful teachers were called monitors. The method was eagerly adopted by Joseph Lancaster (q.v.) who, in the first years of this century, did so much for the extension of popular education; and from him and the originator, the system was called indifferently the Madras and the Lancastrian, as well as the monitorial or mutual system. The monitorial system is not, as is commonly supposed, a method of teaching; it is simply a method of organizing schools, and of providing the necessary teaching power. At a time when the whole question of primary education was in its infancy, the state refusing to promote it on the ground that it was dangerous to society, and the public little disposed to contribute towards its extension, it was of great importance that a system should be adopted which should recommend itself as at once effectual and economical. It was manifest that even with the most skillful arrangement of classes, a single teacher could not undertake the tuition of more than 80 or 90 pupils; while, by the judicious employment of the cleverer boys under the general direction of the master, the school might be made almost self-working, and 300 or 400 children taught where there was only one adult superintendent. The novelty and economy of this plan, and we may add also, its temporary success, gained for it a large and enthusiastic support both in Britain and in Germany. But the importance of the system as an educational agency was universally overrated, for although it is to be admitted that, under an able and enthusiastic master, boys may be inspired to teach well all technical and rote subjects (as, for example, in the Latin and Greek classes under Dr. Pillans of the Edinburgh high school), yet it is manifest that children so instructed are not in any sense of the word educated. Their monitor necessarily lacks the maturity of mind which is indispensable to the instructor, whose business it is to arouse in the child those mental operations which have taken place within himself, and so lead him to an intelligent and rational grasp of intellectual and moral and physical truths. No amount of private instruction from the master, no enthusiasm could ever enable a boy to do this, and consequently the system broke down, after having done its work by being the engine whereby a large interest was stirred up in the education of the masses, and whereby the requisites of a primary teacher were brought into view. The reaction against the system, however, was not so violent in Great Britain or in Holland or France, as in Germany. In England, the monitorial system was modified in such a way as to secure for the master the aid of the more clever boys in teaching rote subjects, in revising lessons, keeping registers, and supervising the work of those classes not directly under the master's tuition. In this way were afforded the means of training for the teaching profession boys who seemed fitted by natural endowment for the work. Hence the prevalent employment in this country of paid monitors and pupil teachers (male and female), who are regularly apprenticed to school-managers and teachers, and go forward to be trained in the normal schools now so numerous.

MONK. See MONACHISM; MONASTERY; *ante.*

MONK, GEORGE, duke of Albemarle, was the son of sir Thomas Monk of Potheridge, in Devonshire, and was born at his father's residence, Dec. 6, 1608. He spent some of his earlier years in the service of Holland, returned to England when about the age of 30, and served in the king's army against the Scots in 1639, attaining the rank of lieut.-col. On the breaking out of the Irish rebellion, in 1642, he was appointed col. of lord Leicester's troops, sent to crush it. When the civil war began, these troops were recalled, and Monk was imprisoned on account of being supposed to favor the cause of the parliament, but was soon after released. In 1664 he was defeated and taken prisoner by Fairfax,

and imprisoned in the Tower, from which he was liberated, after two years, on his swearing the Covenant. Clarendon hints that he sold himself for money. He was now intrusted with the command in the n. of Ireland. Cromwell had a high opinion of his military talents, and made him his lieut.gen. and commandant of artillery; and the service which he rendered at the battle of Dunbar was so great, that he was intrusted with the chief command in Scotland. In 1653, he was joined with admiral Blake in an expedition against the Dutch, and with his division of the fleet, consisting of 100 ships, defeated admiral Van Tromp off Nieuwpoort, and fought another battle with him off Katwijk, in which the victory was doubtful, but Van Tromp lost his life. In April 1654, Cromwell sent him to Scotland as governor, in which difficult office he conducted himself with vigor, moderation, and equity. Even the highlands, those immemorial "sanctuaries of plunder," as Guizot calls them, were reduced to order. His principal residence was Dalkeith, where he spent his leisure hours in gardening, of which he was very fond. When, after Cromwell's death, he saw everything in confusion, and felt his own position perilous, he crossed the English border, Jan. 1, 1660, with 6,000 men, united his troops with those which Fairfax had collected for Charles II., and entered London unopposed, although as yet he kept his views profoundly secret. His powers of dissimulation and reticence were immense. Everybody felt that the decision lay with "Old George," as his soldiers used to call him; every party courted him; he was even offered the protectorate; but while he offended nobody, he declined to connect himself with any of the sectaries, and waited patiently the course of events. His own wish (though it did not proceed from any very high-minded motive) was to bring back the Stuarts; and before long, he saw that the nation in general was thoroughly with him. On the 21st of Feb. he called together the remaining members of the parliament which had been violently driven out 12 years before, and Charles II. was presently recalled. Monk was now made duke of Albemarle, loaded with honors, and intrusted with the highest offices in the state. But he soon retired from political affairs. In 1665, when the plague ravaged London, and every one fled that could, "Old George," as governor of the city, bravely stuck to his post, and did what he could to allay the terror and confusion Next year, he was employed as second in command of the fleet sent under the duke of York against the Dutch; and was defeated by Von Ruyter in a sea-fight off Dunkirk, but soon after gained a bloody victory over him off North Foreland. He died Jan. 3, 1670. Guizot describes him as a "man capable of great things, though he had no greatness of soul." See Guizot's *Monk, Chute de la Republique,* Skinner's *Life of Monk,* Hallam's *Constitutional History,* and Macaulay's *History of England.*

MONKEY, *Simia,* a Linnæan genus of *mammalia,* of the Linnæan order *primates,* and of Cuvier's order *quadrumana,* now constituting the family *simiadæ.* The word monkey was formerly of almost, if not altogether, the same signification with *ape;* but the name *ape* is now more generally applied to those *simiadæ* which have no tail and no cheek-pouches; the name monkey to those which have cheek-pouches and long tails, prehensile or not prehensile; whilst the name *baboon* (q.v.) is applied to creatures considerably different from both. The smaller tailless *simiadæ* are, however, still not infrequently spoken of as monkeys, and the term is also sometimes used to comprehend all the *simiadæ.*

Of all animals, the *simiadæ* exhibit the greatest resemblance to man, both in their general form and their anatomical structure. This is particularly the case with some of the larger apes. In none of them, however, is there a natural adaptation for the erect position so characteristic of man, which is assumed rarely, and in general only by captive individuals, as the result of training and constraint, all of the monkey tribe preferring to walk on four feet rather than on two, but all of them being adapted for living chiefly among the branches of trees, or—according to the habits of a comparatively small number of species—among bushy cliffs, where they make use of the four extremities for prehension, as hands. Most of them leap from branch to branch with wonderful agility, and some also swing themselves from a branch by their long prehensile tail, till they can seize hold of another branch. The thumb, in all the four extremities, is opposable to the fingers, which are long and flexible; but there are some monkeys which want the thumb of the fore-limbs, or have it merely rudimentary, whilst the hind-limbs are always furnished with perfect hands. In attempting to walk erect, an ape necessarily treads, not on the soles, but on the sides of its feet, which are turned inwards, and the muscles of the legs do not enable it to maintain an erect position long or easily. This difficulty is increased by the way in which the head is affixed to the vertebral column, the *occipital foramen* being further back than in man, so that the weight of the head is thrown forward. The face of a monkey exhibits a grotesque resemblance to that of man; but the lower forehead, the less perfect nose, and the more projecting jaws, give it a brutal character. The dentition of monkeys is so similar to that of man, that the dental formula for very many is the same, although many others have an additional molar on each side of each jaw; but in many, the great size of the canine teeth is a marked brutal characteristic. The digestive organs are generally very similar to those of man, but in some of the *simiadæ,* more exclusively confined to vegetable food, there is a remarkable difference in a peculiar and very complicated structure of the stomach. The food of monkeys consists chiefly of fruits, corn, and other vegetable substances; but most of them also catch and eat insects, and even birds, of the eggs of which they are also very fond.

In captivity they learn to eat and drink almost everything that is used by man, and show a great fondness for sweet things, and for alcoholic liquors. The skin of monkeys is generally covered in all parts with hair, but some have the face partially naked, and many have naked callosities on the buttocks. Many have capacious cheek-pouches, in which they stow away food which they cannot consume with sufficient expedition. They are mostly gregarious, although to this there are some exceptions. Many of the species display strong attachment to their mates and to their offspring. One or two young are generally produced at a birth. They display a remarkable propensity and talent for imitation; and this, with their extreme agility, their curious prying disposition, and their love of trick or mischief, makes them very amusing, whether in a wild or a captive state. Many of the stories told of monkeys manifest also a high degree of intelligence, although it may be doubted if the intelligence of any of the species exceeds that of the dog or the elephant. Notwithstanding their resemblance to the human form, their imitative propensity, and their intelligence, none of the monkeys show the smallest capacity for imitating the human voice; and their "chattering" is very unlike articulate speech.

The species of this family are very numerous, but are all confined to the warm parts of the world; Australia, however, and the South Sea islands being destitute of them. They are divided into a number of genera, some of which belong exclusively to particular portions of the world. But in this respect, the most remarkable circumstance is the difference between those of the old world and those of America, the geographical distribution corresponding with the division of the family into two principal groups—the monkeys of the old world (*Catarrhini* of some naturalists), to which alone the name *simiadæ* is sometimes restricted, having the nostrils separated only by a narrow septum, and the tail wanting, short, or long, but never prehensile; the monkeys of the new world (*Platyrrhini*), the family *cebidæ* of some naturalists, having the nostrils widely separated, the tail always long, and often prehensile, most of them having also the four additional molar teeth already noticed, which none of the monkeys of the old world possess; but none of them having cheek-pouches, which many of the monkeys of the old world have. The most interesting genera and species of monkey are noticed in separate articles.

MONMOUTH, a maritime co. in the w. of England, bounded on the s. by the estuary of the Severn, on the w. by Glamorgan, and on the e. by Gloucestershire. Area, 368,399 acres. Pop. '81, 211,374. The chief rivers are the Usk, the Wye on the eastern border, and the Rumney on the western border—all of which flow s. into the estuary of the Severn. The coast-line, 22 m. in length, is indented only at the mouth of the Usk (which is navigable for vessels of the largest size to Newport), and at the mouth of the Wye, which vessels ascend to Chepstow. The surface is elevated in the n. and n.w. (the Sugar-loaf is 1856 ft. high), but the coast districts, comprising the Wentloog and the Caldecot levels, are low and rich, and are protected from the wash of the sea by sea-walls and earthworks. In the fertile valleys of the Usk and Wye, wheat is the principal crop; but in the less favored localities, barley and oats chiefly are grown. Coal, limestone, and ironstone abound in the mineral district of Monmouth, in the n.w. of the country. This district, comprising 89,000 acres, abounds in collieries and ironworks, and is a perfect network of railways. Monmouth was a Welsh county until the reign of Henry VIII., but the ancient language is now heard only in a few western districts. The scenery of this country is unusually beautiful; and in no part of England are to be found so many remains of feudal castles as in the eastern districts of this county. The chief remains are Raglan, Caldecot, and Chepstow castles; and Llanthony and Tintern abbeys (q.v.). Roman antiquities are numerous. The county sends two members to parliament.

MONMOUTH, a co. in e. central New Jersey, bounded on the e. by the Atlantic, and n. by Sandy Hook and Raritan bays; drained by the Neversink, Shrewsbury, Shark, and Tom's rivers, and intersected by the Central New Jersey, New Jersey Southern, and Freehold and Jamesburg Agricultural railroads; about 500 sq.m.; pop. '80, 55,535—4,712 of foreign birth. The surface is very level, sandy near the sea, but fertile in the interior; potatoes, wheat, oats, butter, and hay are the staples; of potatoes, the annual yield is over a million bushels. Long Branch (q.v.), a fashionable watering place, is situated on the coast of this county.

MON'MOUTH, a parliamentary and municipal borough and market-town of England, capital of the county of the same name, stands, amid beautiful scenery, at the confluence of the Monnow and the Wye, 21 m. w.s.w. of Gloucester. Its church, dating from the 14th c., is surmounted by a lofty spire. Of its castle, the favorite residence of John of Gaunt, and the birthplace of Henry V., the ruins only remain. A building, said to be the study of Geoffry of Monmouth, is all that exists of the Benedictine monastery. Railways connect the town with Newport on the w. and Ross on the e. Ironworks

MONKEYS, ETC.--1. Skeleton of young orang-outang. 2. Chimpanzee. 3. Skull of young chimpanzee. 4. Skull of old gorilla. 5. Skull of young gorilla. 6. Kahau. 7. Mona. 9. Mandril. 10. Skull of Parian. 11. Black howling monkey. 12. Coati. 13. Apuba. 14. Night monkey. 15. Uistite. 16. Skull of Egyptian. 17. Skull of Kaffir.

employing a number of workmen, are in operation. Pop. (1881) 6,112. Monmouth unites with Newport and Usk in sending a member to parliament.

MONMOUTH, a city in Illinois, at the junction of the Chicago, Burlington and Quincy, and the St. Louis, Rock Island, and Chicago railroads; pop. '80, 5,000. It is the county seat of Warren co., in a fertile agricultural region, where beds of bituminous coal are found. It is 15 m. s.w. of Galesburg, 28 m. n.e. of Burlington, Iowa, and 47 m. s. of Rock Island. It is the seat of Monmouth college (United Presbyterian), open to both sexes, organized 1853, having a library of 1850 vols.; also of the theological seminary of the northwest, organized 1839, having a library of 2,442 volumes. It has a commercial college, a public library, an academy, excellent public schools, 5 hotels, 2 national banks, 9 churches, public halls, a court-house, and a fine opera house. There are 3 newspapers, 2 monthly magazines and two grain elevators. It has flour and planing mills. Its leading industries are the manufacture of agricultural implements, woolen goods, machinery, files, furniture for churches and schools, carriages, etc.

MONMOUTH, James, Duke of, natural son of Charles II., was born at Rotterdam in 1649. His mother, Lucy Walters, according to Evelyn, a "browne, beautiful, bolde, but insipid creature," came to England with her son in 1656, during the commonwealth. She is said to have been treated as though she had been the king's wife, and was committed to the Tower; but was soon allowed to retire to France, where she died. Charles sought out the boy, and committed him to the care of Lord Crofts, who gave him his own name. On the restoration, Monmouth, then "Mr. James Crofts," came to England with the queen-dowager, and was handsomely lodged at Hampton Court and Whitehall. These honors were, in after years, referred to by his followers as justifying their belief that he was indeed the king's legitimate son. A wealthy heiress, Anne, daughter of the earl of Buccleuch, was seleeted for his wife; and before he had completed his 16th year, he was married to her, and was created duke of Monmouth. About the year 1670, Shaftesbury put Monmouth forward as the head of the popular party, and rival of the duke of York (afterward James II.). At the period of Titus Oates's plot (1678), rumors that the "Protestant Duke" was indeed the king's legitimate son spread far and wide. The duke of York was compelled to quit the kingdom; and parliament brought forward a bill for excluding him from the suceession, when Charles suddenly dissolved it. A document was at the same time issued by the king, solemnly declaring that he had never been married to Lucy Walters. Monmouth was sent into Scotland, in 1679, to quell the rebellion. He defeated the Covenanters at Bothwell Bridge; but his humanity to the fleeing and wounded was so conspicuous, and his recommendations to pardon the prisoners was so urgent, as to bring upon him the violent eensures of the king and Lauderdale. He thus became the idol of the English Noneonformists. The return of the duke of York, and the exile of Monmouth, soon followed. In Holland, he allied himself to the leaders of the Nonconformist party, exiled like himself; and when he was allowed to return to London, he was reeeived with sueh demonstrations of joy, that Monmouth felt that he was the people's choice. In 1680, he made a semi-royal progress through the w. of England, with the design, probably, of courting the Nonconformists, who were more numerous there than in any other part of the country, except London and Essex. In 1682, he traversed some of the northern counties. The king and his brother were alarmed; and Monmouth was arrested at Stafford, and bound over to keep the peace. He meanly confessed his participation in the Rye-House plot, accusing himself and others of a design to seize the king's person, and subvert his government. The king pardoned him, on his solemn promise to be a loyal subject to the duke of York, in ease the latter should survive the king. In 1684, Monmouth fled to Antwerp, and remained abroad until the death of the king, when he resolved to embark for England. He landed (June 11, 1685) at Lyme-Regis, and issued a manifesto declaring James to be a murderer and usurper, eharging him with introducing popery and arbitrary power, and asserting his own legitimacy and right by blood to be king of England. He was reeeived with great acelamations at Taunton, where he was proclaimed as James II. At Frome, he heard the news of the defeat of Argyle, who, at the head of the Scottish exiles, had attempted to raise an insurrection in Scotland. Money and men were now abundant; but arms were wanting, and thousands went home for want of them. On July 5, he was persuaded, with only 2,500 foot and 600 horse, to attack the king's forces, which, under the command of the earl of Faversham, were encamped at Sedgemoor, near Bridgewater. Monmouth's troops were unable to cross a running stream or wide ditch which protected the camp, and were mowed down by the king's artillery. Their ammunition soon failed; and Monmouth having set a cowardly example of flight, his troops were slaughtered like sheep. About 300 of Monmouth's followers fell in the battle; but 1000 were massacred in the pursuit. Monmouth was found concealed in a ditch, and was brought to London. He made the most humiliating submissions, and obtained a personal interview with James. "He clung," says Macaulay, "in agonies of supplications round the knees of the stern uncle he had wronged, and tasted a bitterness worse than that of death, the bitterness of knowing that he had humbled himself in vain." Even his prayer for "one day more," that he might "go out of the world as a Christian ought," was brutally refused. On June 15, he was brought to the scaffold, and beheaded on Tower Hill; the executioner performing

his office so unskillfully that five blows were struck before the head was severed. The "Bloody Assize" afterwards commenced under judge Jeffreys, when Monmouth's adherents paid a fearful penalty for their participation in his rash and ill-advised rebellion.

MONMOUTH, Battle of, so-called, though the battle occurred at Freehold, N. J., which is in Monmouth co., and which point sir Henry Clinton had reached, after his evacuation of Philadelphia, when attacked by gen. Washington's little army. The battle took place June 28, 1778, and was opened by gen. Lee, who commanded the advance of the American force, numbering about 4,000 men. Lee's attack was met by more serious resistance than he had anticipated; or, probably, his raw and worn-out volunteers, who had hardly yet recovered from the terrible winter at Valley Forge, were in no condition to fight the British veterans. A rout of the Americans was the result, and they fell back on the main body, which was commanded by Washington in person. The latter was enraged at seeing the disorderly retreat, and upbraided Lee in the most violent and bitter manner. He then took command himself, rallied the fugitives, and a sharp engagement commenced. The American force was advantageously posted on a height, protected by marshy ground, and where they could use their artillery with good effect. Lee was permitted to resume command of his men, and succeeded in holding his position until ordered at last to retire, which he did in good order. The left of the American line was commanded by lord Stirling, and here some sharp fighting took place, the British making strenuous but inadequate efforts to turn it. Failing in this, they directed their attention to the American right, under Greene, with Wayne posted in good position in an orchard, where he succeeded in keeping up a galling fire upon the enemy, under cover of the trees. The latter made every effort to oust the Americans from this position; and here col. Moncton fell at the head of his grenadiers while making an attack. It becoming evident to the British commander that the Americans were too strongly placed to be dislodged, he ordered his men to fall back. The battle ended with this movement, the Americans not being strong enough to follow up their slight advantage; and during the night the British made a hurried retreat, undiscovered. This was one of the occasions during his life when gen. Washington completely lost his temper; and for the error or cowardice which occasioned this, Lee was court-martialed, and his command was taken from him for one year.

MONNIER, Henri Bonaventure, b. Paris, 1799–1877 ; educated in Paris, taking up the pencil and pen after essaying trade. In 1825 his pen-sketches had already attracted much attention, and he increased the reputation of his work by its circulation through the then new art of lithography. In 1826 he illustrated the poems of Béranger and the fables of La Fontaine, and increased his reputation for the creation of character types. After becoming famous for this work, he began to write laughable mimicries of humorous scenes in the lives of the people of the street, of which his works published in 1830, entitled *Scènes Populaires* and *Mémoires de Joseph Prudhomme*, are examples. In 1831 he became an actor at the *théâtre de Vaudeville*, where his original humor as an actor made him a great favorite, excelling particularly in the representation of scenes of his own creation, which were introduced in the first play in which he took part, entitled *Famille Improvisée.* His ambition was soon sated with success as an actor, and his pen resumed work on comedies that needed no stage to enhance their effect, and which have become classic among the French. Among them are: *Un Voyage en Hollande; Les Bourgeois de Paris; Roman chez la Portiere; Le Bonheur de Vivre aux Champs; Peintres et Bourgeois;* and *Les Métamorphoses de Chamoiseau*, several of which are adapted to the stage.

MONNIER, Marc, b. in Italy, 1828; became a resident of Paris, where he was a student of history, literature, and manners; and published esteemed works both in prose and verse. In later years he was one of the editors of the *Journal des Debats.* Among his historical works are: *La Conquête de la Sicile par les Saracens*, 1847; *Protestantism en France*, 1854; *L'Italie, est elle la Terre des Morts?* 1859; *Garibaldi, Histoire de la Conquête des Deux Siciles*, 1861. Of works of another character are: *La Vielle Fille; La Tante Jeanne; Les Amours Permise.* Of comedies and *marionettes* are *Le Roi Babolein; Le Curé d' Yvetot; La Ligne Droite; Mouche du Coche;* and *Aïeux de Figaro.* A volume of his poems was published in Paris in 1871. He d. 1885.

MONO, a co. in e. California, between Nevada and the Sierra Nevada mountains; 4,176 sq.m.; pop. '80, 7,499—4,081 of American birth. The surface is irregular, intersected by numerous mountain offshoots and hills, between which are arable valleys. Some of the plain country is adapted to grazing. Much of the county is heavily wooded with spruce and pine. Owen's river flows through the s., and the branches of Walker's river through the north. Gold and silver are found in paying quantities in the n.w. part. Wheat is being cultivated with success, and there are saw and quartz mills. Capital, Bridgeport.

MONOCENTRIS JAPONICUS, a species of fish which is an inhabitant of the Chinese and Japanese seas, for which a family, *monocentridæ*, and a genus *monocentris*, have been created. It belongs to the order *teleostic*, sub-order *acanthopteri.* It has a compressed, somewhat oblong body, with large scales in the form of osseous plates; eyes large and lateral; teeth villiform, both on jaws and palate bones; branchiæ large; dorsal

fins two, first one very spiny, having but little connecting membrane; the second dorsal fin opposite the anal, and similar. The ventral fins each have a single strong spine and two or three short rays.

MO'NOCHORD, an apparatus constructed to exhibit the mathematical proportions of musical intervals. It consists of a flat board of 4 or 8 ft. long, better 16 ft, where space can be spared. The breadth of the board is according to the number of the strings, which are from 2 to 6. The board is covered with fine white paper. A straight line is drawn from end to end below each string, and each line is accurately divided into the different proportions into which the full length of the string, as a fundamental sound, harmonically divides itself. See HARMONICS. The string is fixed at one end, and rests on a bridge; while at the other end, where it also rests on a bridge, it is stretched by a tuning-peg, or by a weight. The sounds from the strings are produced by a violin-bow. The monochord is chiefly used in illustrating acoustical experiments in the proportion of intervals and temperament.

MONOCOTYLED'ONOUS PLANTS, plants in which the embryo has one and only one cotyledon (q.v.). The cotyledon in these plants varies extremely in form, and is often comparatively of great size, but has always a slit, from which, as germination takes place, the gemmule sprouts. The gemmule in elongating assumes an acuminated shape. Monocotyledonous plants are all endogenous (q.v.); except the dictyogens (q.v.), in which the endogenous structure is not perfectly exhibited. They are also *endorhizal* (Gr. *endon*, within, *rhiza*, a root); that is, the radicle is covered with a cellular sheath, and gives rise to fibrils similar to itself in structure. The leaves are generally sheathing at the base, and there embrace the stem; they also generally have simple parallel nerves connected by cross veins, the leaves of dictyogens alone being reticulated. The number of the parts of the flower is generally 3, or a multiple of 3. The floral envelopes, often splendid, as in lilies, tulips, etc., are generally united as a perianth (q.v.), instead of forming a distinct calyx and corolla. The principal natural orders of monocotyledonous plants are grasses, *cyperaceæ*, palms, orchids, *scitamineæ*, *musaceæ*, *liliaceæ*, and *iridaceæ*. The general appearance of monocotyledonous plants distinguishes them almost as perfectly as any structural characters.

Of the fossil remains of the vegetable kingdom, the smallest portion consists of monocotyledonous plants, both acotyledonous and dicotyledonous plants being much more abundant.

MONOD, ADOLPHE FREDERIC THEODORE, 1802–56; b. Copenhagen. His father, Jean, residing in Paris as pastor of a French Protestant church, the son was educated at the college Bonaparte, Paris, and then studied theology at the university of Geneva, remaining till 1824. In 1825 he visited Italy, and preached to a small Protestant congregation at Naples until 1827. Returning, he was appointed pastor of Lyons, but, his evangelical and earnest preaching being disliked, he was removed. His congregation then met in a private room, and soon in a spacious chapel, and at the end of 30 years the evangelical church of Lyons had 4 pastors, many evangelists, and 8 chapels. He was appointed by the government professor of theology at Montauban, where he remained 11 years. While filling this office he traveled in southern France, preaching and instructing the people, who were attracted by the power of his discourses. Though holding the views of his brother in regard to the divinity of Christ, he remained in the national church, and in 1849 succeeded his brother as pastor at Paris, being appointed by the consistory of Paris, the government confirming the selection. The large oratoire was filled every Sunday, and the small room was used for Bible lessons, many preferring these to his greater sermons. In 1856 he was suddenly stricken down, and his disease pronounced incurable. He was a man of great spiritual power, a sympathizing heart, highly cultivated mind, and lofty imagination. He was an eloquent preacher. His literary works were chiefly sermons. In 1844 he published a volume of sermons of 68 pages, which are considered very valuable. He is the author of *Lucile, ou la Lecture de la Bible; La Femme; Saint Paul.*

MONOD, FRÉDÉRIC JOËL JEAN GÉRARD, 1794–1863; b. Monnaz, canton de Vaud, Switzerland; educated at Geneva; entered the ministry in 1820, and succeeded his father as pastor of the national Protestant church of France in Paris. He established in 1824 the *Archives du Christianisme,* the chief organ of the evangelical French Protestants, and continued its editor until his death. After officiating 12 years as pastor of the oratoire, he united with De Gasparin and others in an attempt to restore a rule of faith in the reformed church which would exclude rationalists, by making an acknowledgment of the divinity of Christ essential to membership. Failing in this, they left the national Protestant church in 1849, and organized independent congregations which resulted in the formation of the Free evangelical church of France. Associated with Monod were count de Gasparin, E. de Presseusé, and pastor Fisch. The influence of the Free church has been so great that the majority of the state church are now represented to be evangelical. In 1858 Monod visited the United States to interest the churches here in their new movement. He greatly admired American institutions, and referred to this country as evidence of the advantage of entire separation of church and state. During the war of the rebellion, he ardently espoused the side of the national government, and was one of the originators of the address which was signed by the majority of the Protestant

French ministers, declaring that "the triumph of the rebellion would throw back for a century the progress of Christian civilization and of humanity, raise the hopes of the favorers of slavery and the slave trade, and would give a sad blow to the work of evangelical missions." The address produced a marked change of opinion towards the United States not only in France, but also in England. He published a few pamphlets and several sermons, but most of his writings are in the *Archives du Christianisme*.

MO'NODON. See NARWHAL.

MONŒ'CIOUS (Gr. *monos*, one, and *oikion*, a habitation), the term used in botany to describe those plants which have the male and female parts of fructification (*stamens* and *pistils*) in different flowers, but upon the same plant. The flowers of such plants are also said to be *monœcious*. Monœcious plants form one of the classes of the Linnæan artificial system, but many occasional instances of monœcious species are to be found in genera belonging to other classes. Monœcious plants often have the flowers in catkins, sometimes the male flowers only; and often in spikes, the male flowers sometimes occupying the upper, and sometimes the under part of the same spike with the female flowers, and sometimes distinct spikes upon the same plant. Common examples of monœcious plants are the hop, box, birch, beech, alder, oak, and hazel.

MONOGRAM (Gr. *monos*, alone, and *gramma*, letter), a character composed of two or more letters of the alphabet, often interlaced with other lines, and used as a cipher or abbreviation of a name. A perfect monogram is one in which all the letters of the word are to be traced. The use of monograms began at a very early date. They are found on Greek coins, medals, and seals, and are particularly numerous on the coins of Macedonia and Sicily. Both on coins and in MSS. it was the practice to represent the names of states and cities by monograms, of which above 500 are known, but some have not been deciphered. Monograms occur on the family coins of Rome, but not on the coins of the earlier Roman emperors. Constantine placed on his coins one of the earliest of Christian monograms, which is to be traced in the recesses of the catacombs, composed of the first and second letters of ΧΡιστος (Christus), a monogram which also appeared on the Labarum (q.v.), and was continued on the coins of the succeeding emperors of the east down to Alexander Comnenus and Theodorus Lascaris. We often find it combined with the first and last letters of the Greek alphabet (Rev. i. 8). Another well-known monogram is that of the name of Jesus, IHS, from the first three letters of ΙΗΣοῦς.

Popes, emperors, and kings of France during the middle ages were in the practice of using a monogram instead of signing their names. Almost all the coins of the French kings of the Carlovingian race bear their respective monograms, as also do those of Alfred and some of the other Saxon kings of England.

Painters and engravers in Germany and Italy have used monograms to a large extent as a means of distinguishing their works. In these, the initial letters of their names were often interwoven with figures of a symbolical character, so as to form a rebus on the artist's name. The first typographers distinguished their publications by wood-cut vignettes, whose invention is ascribed to the elder Aldus; but besides these, each made use of a monogram or cipher, a series of which, well known to the bibliographer, fixes the identity of the ancient editions, German, Italian, and English, from the invention of printing down to the middle or end of the 16th century. For a detailed account of the monograms of early printers and others, see Brulliot, *Dictionnaire des Monogrammes* (Munich, 1832–34): Horne's *Introduction to Bibliography*, vol. ii.; and Herbert's and Ames's *Typographical Antiquities*.

MONOGRAPH, a work in which a particular subject in any science is treated by itself, and forms the whole subject of the work. Monographs are entirely of recent date, and have contributed much to the progress of science. In botany especially, monographs of orders and genera are very numerous; and some of them are among the most splendid and sumptuous of scientific works.

MONOGUE, PATRICK, D.D. See page 882.

MONO LAKE, in Mono co., Cal.; 14 m. long. Its waters are very alkaline and bitter. It has no outlet.

MONOLITH, a monument, column, obelisk, statue, or other structure formed of a single stone. In India there are examples of monolithic temples, the whole being cut out of the solid rock.

MONOMA'NIA has loosely been made to represent every form of partial insanity; but has been more rigidly defined as that mental condition in which a single faculty, or class of faculties or associations, become diseased, the mind generally remaining healthy. Slight and solitary aberrations, such as where a savage antipathy to cats coexists with a love for human kind; where there appears to be an incontrollable tendency to steal, to squander, to drink, to destroy, are of common occurrence, and are supposed to be compatible with the exercise of intelligence, and with the discharge of many of the ordinary duties of life. By a more strict limitation, the term has been confined to such affections as involve the emotions and propensities alone. It is, however, held that, notwithstanding its apparent integrity, the whole mind is involved or influenced by the presence of such morbid conditions, at least while they are predominant. It is undoubtedly difficult to point out in what manner the belief, e.g., that a particular organ has been transmuted into glass, can interfere with or render the memory, or the power of instituting compari

sons, defective and untrustworthy; yet it is legitimate to receive with caution *every* manifestation of powers so constituted that they fail to detect the incongruities and absurdities with which they are associated; or, having detected the real character of these errors, are unable or unwilling to cast them out, or to disregard them. There is much countenance given to this theory by facts which indicate that even trivial forms of mental obliquity are connected with an unsound organization; and that particularly and rarely recognized monomanias are invariably associated with the *same* structural alteration. The unhealthy elevation of the sentiment of cautiousness, for example, especially where it amounts to fear of death, panic, or panphobia, is a symptom of disease of the heart and large blood-vessels; while the monomania of ambition, or optimism, as it has been styled, is the concomitant of the general paralysis of the insane. It will be obvious, from the definitions previously introduced, that the species or varieties of monomania must correspond to the faculties or phases of the human mind, and to their combinations. Several great divisions, however, have been signalized, both on account of their frequency and of their influence upon the individual and upon society. 1. Monomania of suspicion, comprehending doubts in the fidelity and honesty of friends and those around, belief in plots and conspiracies, the dread of poison; and where, as is often the case, it is conjoined with cunning, the propensity to conceal, mystify, and deceive. This malady has frequently been observed in intimate connection with cancer and malignant growths. 2. Monomania of superstition and unseen agencies, where credulity, mingled with religious awe, peoples the external world with spectres, omens, mysteries, magnetism; and the imagination with horrors or ecstatic reveries. Insensibility to pain, or indifference to external injuries, has been observed as a characteristic of individuals affected with this disease. 3. Monomania of vanity, or euphoria, where display and ostentation are indulged, without reference to the position and means of the patient. 4. Monomania of fear. 5. Monomania of pride and ambition. 6. Kleptomania (q.v.). 7. Dipsomania (q.v.). If it can be proved that such morbid tendencies, as have been here mentioned, and others still less prominent, are merely salient points of a great breadth and depth of mental disease, the plea of insanity may justifiably be employed more frequently in the consideration of criminal acts.—Esquirol, *La Monomanie;* Bayle, *Maladies du Cerveau;* Stephens's *Criminal Law of England,* p. 92.

MONOMOISE or Monomoezi, a country in central Africa, on the e. shore of lake Taganyka. It was known in the 16th and 17th centuries as Monemuge or Munhemuge, though all these names are said to apply properly to the ruler of the country, and not the country itself. The name is little used at present, and the territory is split into a number of small kingdoms. Its former area was estimated at 240,000 sq. miles. Its inhabitants were continually at war, but higher in civilization than most South African tribes. Ivory, copper, cotton, and oil are exported by means of caravans.

MONONA, a co. in w. Iowa, on the Missouri; 730 sq.m.; pop. '80, 9,055—7,868 of American birth. The Little Sioux river flows through it. It is chiefly fertile prairie. Indian corn, wheat, and oats are raised. Co. seat, Onawa.

MONONGAHE'LA, a river which rises in the Alleghany mountains in Virginia, United States of America, and flowing n. into Pennsylvania, unites with the Alleghany at Pittsburg to form the Ohio. Its whole length is 300 miles. It is navigable for steam-boats to Brownsville, 60 m., with dams and locks for low water. Vast seams of coal open in its high banks, from which flat boats are loaded, and floated down with the current through the Ohio and Mississippi.

MONONGALIA, a co. in n. W.Va., next to Pennsylvania; 500 sq.m.; pop. '80, 14,985—317 colored. The surface is irregular, and Laurel hill, a w. offshoot of the Alleghanies, traverses the e. part. The soil is rich, and produces good crops of Indian corn, wheat, oats, and potatoes. The Monongahela and Cheat rivers flow through it. There are large forests, and deposits of bituminous coal. Co. seat, Morgantown.

MONOPE'TRAL, a temple formed of an open circle of columns carrying a roof, and without a cell.

MONOPHYSITES, the name given to a widely ramified sect of Christians who hold that Christ has only *one* nature (Gr. *monos,* one; *physis,* nature), a human nature become divine. Monophysite views were first decidedly put forward in the controversy against Nestorius. Cyril having expressed the opinion that the flesh of the Logos was essential to his personality, the archimandrite Eutyches (q.v.) went on to assert a deification or apotheosis of the flesh of Christ, and obtained the consent of a synod at Ephesus, in 449, commonly called the "synod of robbers," to this doctrine; but he and his adherents (at first called after him Eutychians) were condemned as heretics by the council of Chalcedon in 451. It was after this council that the name *Monophysites* began to be used. The decision of the council, however—viz., that in Christ *two* natures, neither interfused, changed, nor divided, were united in *one* person, and constituted *one* hypostasis—was not calculated to allay, but rather to increase discord. Accordingly, the strife grew hotter. The Asiatic and Egyptian clergy, strongly opposed to Nestorianism, were generally inclined to Monophysite views, and received countenance from the emperor Basiliscus. After long, and often bloody contests between the supporters of the opposite opinions, the Monophysites, formerly separated from the orthodox church. This sepa-

ration took place in the first half of the 6th c., when the imperial protection hitherto bestowed upon them was lost by the alliance of the emperors Justin and Justinian with the Latin church. Besides, they had not maintained unity among themselves. As early as 482, when the emperor Zeno published his famous *Henoticon*, or formula of concord, it was accepted by several of the more moderate Monophysites. This roused the indignation of the extremer sectaries; they renounced fellowship with their laxer brethren, and formed a sect of their own. They were called *Akephaloi*, and formed the *ultras* among the Monophysites. Controversies arose also in 519 on the question, whether or not the body of Christ was corruptible. The Severians—adherents of Severus, a deposed bishop of Antioch—affirmed that it was; the Julianists, or Gajanites, followers of bishop Julianus or Gajanus, denied it. The former were consequently called (Gr.) *Phthartolatrists*, (Lat.) *Corrupticolæ* (worshipers of the corrupt); the latter, *Aphthartodocetæ* (believers or teachers of incorruption), and sometimes—as an incorruptible body could only be apparent, and not real—*Phantasiasts*. The *Aphthartodocetæ* split again on this other point—whether or not Christ's body was created; the *Aktistetoi* (Gr. *ktizo*, to create) asserting that it was not created, and the *Ktistolatrists*, that it *was*. The Severians, called also, after one of their bishops, *Theodosians*, finally got the the upper hand, and excommunicated their opponents, including another sect, the *Agnoetoi*, who denied that Christ as a man was omniscient. About 560 the Monophysite Askusnages, and after him the Christian philosopher Philoponus, ventured to speak of the three persons in the Godhead as three gods. This, however, was reckoned heretical even by the Monophysites themselves, and was the occasion of a large recession to the bosom of the Catholic church. Monophysite communities continued strongest in Egypt, Syria, and Mesopotamia, where they maintained a regular ecclesiastical order under their own patriarchs of Alexandria and Antioch; and after the Syrian, Jakob Baradæus (Al-Baradai, died about 578), had drawn up for them an ecclesiastical constitution, they formed the independent churches of the *Jacobites* (q.v.) and *Armenians*. See Armenian Church. The Coptic and Abyssinian churches are also Monophysite in doctrine.

MONOP'OLI, a t. of southern Italy in the province of Bari, situated on the Adriatic shore, in a pleasant and healthy plain, 28 m. e.s.e. of Bari. Pop. about 20,000. It is supposed to be of Grecian origin, the name in Greek signifying the *solitary city*. It is surrounded by walls, and has a fortress constructed in 1552 by Charles V. The neighboring territory yields an immense quantity of olive oil.

MONOPOLY, from the Greek, signifies sole selling or individual selling, and has always been used to express a limitation to one or more persons of the right or power to conduct business as a trader. It is generally used in a bad sense to express something injurious, but economic science has lately very much narrowed the field over which its injurious character is supposed to extend. In the first place, it must be created by force; if it come in the natural course of trade, it is generally beneficial. Thus, to a village where three or four traders have conducted a small lazy business, drawing large profits, there comes a capitalist, who sets up a large concern on the ready-money system, and, by selling good articles at a low rate, absorbs all the business. He is of course abused as a monopolist by the ineffective persons he has superseded; but his presence is a blessing to the community generally. If, however, he had gone to the village, not to compete with others, but with a royal patent in his pocket securing to him the exclusive trade of the village, as he could sell at his own price, and make a fortune without trouble, he would of course be, like the old royal monopolists, a calamity to the people.

A careful distinction must be preserved between monopoly and property—that is to say, an exclusive right to *trade* must be separated from an exclusive right to *possess*—for, while the law of property exists, possession will always be exclusive. If, then, a trade can only be conducted with large capital, it must fall to those who either singly, or by co-operation, can command that capital; and the answer to all complaints on the part of others is, that since capitalists can best serve the public, it is best for the public that capitalists should be allowed to do so. The old corn-laws and landed property conjoined to produce one of the best illustrations of the distinction. The power of producing grain within Britain has always been of necessity limited to those who have, either as owners or tenants, the command of the land. Forfeit all the land in the country to-morrow, and proclaim the production of grain to be free, the result would only be a change of ownership; for those who by their good-luck, or more probably by their power, got hold of rich old wheat-lands, would produce their grain much cheaper than those who got the poor lands, and, selling the produce at the same price, would pocket the difference, which would, in fact, just be rent gained by them as the new landlords. But when dealers offered the people grain from abroad, and the corn-laws rendered it impossible to sell that grain in this country, then there was a monopoly in favor of the home-producer, having the effect of artificially raising prices, and otherwise disturbing trade.

A deal of legislation was wasted by our ancestors in enactments to prohibit people from creating monopolies by that fair competition which is now considered the true healthy development of trade. Some account of them and of their repeal will be found in the article Engrossing. When British trade was increasing in the 16th c., it found some old powers alleged to be inherent in the royal prerogative for conferring exclusive

trading rights, which led to much oppression and loss. In queen Elizabeth's parliament of 1597 a complaint was made that, for the benefit of favored courtiers, oppressive monopolies had been granted, not only for the sale of foreign luxuries, but for salt, leather, coal, and other articles of ordinary consumption. Queen Elizabeth said she "hoped her dutiful and loving subjects would not take away her prerogative, which is the choicest flower in her garden, and the principal and head pearl in her crown and diadem." Parliament returned to the charge, however, in 1601, when, on the reading over of the list of monopolies, a theatrical scene occurred by a member calling out: "Is not bread among the number?" and on this producing a sensation, continuing: "Nay, if no remedy is found, bread will be there before the next parliament." In 1621 parliament took proceedings against sir Giles Mompesson, charged with an oppressive use of his patent's monopoly. Four years afterwards, an act was passed limiting this power in the crown. It leaves only the right to grant a limited monopoly in the manufacture of his invention to any inventor, and this is the origin of the present patent law. See PATENT.

MONOPTERUS JAVANENSIS, a peculiar species of eel found in the East Indian seas and along the coasts of China and Japan. It has a more elongated body than most eels; teeth small and embraced in a narrow band; branchial apertures meet in a median slit beneath; no caudal or pectoral fins; dorsal and anal fins rather small; branchial arches have rudimentary laminæ. It has about 188 vertebræ and is 3 ft. or more in length.

MONOS'TOMA, a genus of trematoid worms, so called from having only a single sucker, which is situated anteriorly, and surrounds the mouth. It belongs to the *trematoda digenea* (of Van Beneden), all of which present the phenomena of alternation of generations, the earlier or larval forms occurring chiefly in molluscs, while the perfect worms are found, for the most part, in vertebrated animals. Among the species of this genus occur *M. flavum*, found in water-fowl (the larva being the *cercaria ephemera*, which is common in *planorbis*, etc.), *M. mutabile*, found in various birds, and *M. lentis*. The last-named species derives its specific name from its having been found by Van Nordmann in a lens extracted in a case of cataract. Cobbold and other distinguished helminthologists are inclined to believe that this is not an independent species, but that it is identical with the *distoma ophthalmiobium* of Diesing.

MONOTHEISM, the term usually employed to denote a belief in the numerical unity (*unus numero*) of the Godhead, or belief in and worship of one God. It is thus the opposite of *polytheism* (q.v.). See GOD. The "doctrine of the Trinity" is thought by some to be incompatible with the monotheism taught by Jesus Christ, and is therefore rejected as no part of his teaching. See UNITARIANS. Mohammedans and Jews hold the doctrine of the "unity of God," even more rigorously in some respects than modern Christians: at least they reject with vehemence the least approach to a Trinitarian conception of the Deity. The majority of mankind are polytheists.

MONOTH'ELISM (Gr. *monos*, single, and *thelein*, to will), a modification of Eutychianism, which was introduced after the condemnation of that doctrine by the council of Chalcedon. It consisted in maintaining that, although Christ had two natures, yet these natures possessed or acted by but a single will, the human will being merged in the divine, or absorbed by it. The author, or at least the most active propagandist of this doctrine, was Sergius, patriarch of Constantinople, who obtained for it the support of the emperor Heraclius; and its progress was materially forwarded by the silence which, at the instance of Sergius, and under his representations, the pope, Honorius (q.v.), was induced to maintain regarding the question. The doctrine was formally condemned in the sixth general council held at Constantinople in the year 680, with which condemnation it is commonly said that the early controversies on the incarnation were ended. See EUTYCHES and MONOPHYSITES.

MONOTH'ELITES (MONOTHELISM, *ante*), persons in the early church who, in the effort to explain the mystery of Christ's person, said that he possessed only one will. Eutyches, about the middle of the 5th c., had taught that Christ had only one nature, his human nature having been *absorbed* by his divine. The impersonal human nature, he said, was assimilated and, in a manner, deified by the personal Logos, so that his body was not of the same substance as those of mankind generally, but was a divine body. All human attributes, also, in his opinion, were transferred to the one subject, so that it must be said, God was born, God suffered, was crucified, and died. The monophysites, in distinction from the Eutychians, held that the two natures were so *united* as to become only one nature. And these were followed by the monothelites, who maintained that Christ, though retaining two natures, had only one will, the human will being merged in the divine. That is, while speaking of two natures, they were in fact Eutychians so far as respected the faculty of the will. This theory was made prominent in the effort of the emperor Heraclius to compose the disputes in the church, and especially to bring back the Eutychians and monophysites, the latter of whom were very powerful. Their leader, Cyrus, patriarch of Alexandria, called a synod, 633 A.D., which approved the monothelite statement, and with good effects at least for a time. Many Eutychians in Armenia, Egypt, and other remote districts, were brought back to the church. The decision, however, was opposed by Sophronius, a monk of Palestine, who, on being made patriarch of Jerusalem, did not hesitate to resist both the open approval

of it by the patriarch of Constantinople and the tacit consent yielded to it by the pope of Rome. He soon summoned a council, which condemned the doctrine of the one will as being a part of the Eutychian heresy. This decision, in its turn, was condemned by the emperor Heraclius, who issued a decree forbidding all controversy on the subject; but his influence in upholding monothelism was soon arrested by his death; and, after much controversy and mutual condemnation, the first synod of the Lateran, 649, adopted the doctrine of the two wills and two energies. The final condemnation of monothelism was pronounced at the 6th general council, Constantinople, 680, where it was declared that there are in Christ two natural wills and two natural operations, without division, conversion, or change; with nothing like antagonism or like confusion; but at the same time that the human will could not come into collision with his divine will, but is in all things subject to it.

MONOTREM'ATA (Gr. *monos*, single, *trēma*, an opening), the lowest order of mammalia, in many of their characteristic points indicate an approximation to birds. The skull is smooth; the brain-case very small as compared to the face; the snout much prolonged, and the jaws unprovided with soft movable lips, and not furnished with teeth. (In the ornithorhynchus there are two horny plates in each half-jaw, which act as teeth, while in the echidna even these substitutes for teeth are wanting.) The cranial bones coalesce, as a bird's, at a very early period, and leave no signs of sutures. The external ear is altogether absent; while the eyes, though small, are perfectly developed.

The bones of the shoulder, forming the scapular arch, are unlike those of any other mammals, and in some respects resemble those of birds, and in other respects those of reptiles. At the top of the sternum is a T-shaped bone, formed by the union of the two clavicles, corresponding to the *furculum* in the bird's skeleton. The coracoid bones, which in other mammals are mere processes of the scapula, are here extremely large, and assist, as in birds, in strengthening the scapular arch; while the scapulæ themselves are produced beyond the socket of the humerus (the glenoid cavity), so as to articulate with the sternum.

The pelvis is provided with marsupial bones, although these animals do not possess a pouch.

The feet have five toes, armed with long nails; in addition to which, the hind-feet of the males are provided with a perforated spur-like weapon, which is connected with a gland. The Australian aborigines believe the wounds made by this spur to be poisonous; but there is no scientific evidence of the fact.

The ovaries are analogous to those of birds, the right ovary being comparatively undeveloped, while the left forms a racemiform mass. The orifices of the urinary canals, the intestinal canal, and the generative canal, open, as in birds, into a common cloaca, from which circumstance the order *Monotremata* derives its name. The mammary glands, of which there is only one on each side, are not provided with nipples, but open by simple slits on each side of the abdomen.

This order includes only two or three species, all natives of Australia or Van Diemen's Land, which, however, form two families—the *ornithorhynchidæ* (see DUCK-BILL), and the *echidnidæ* (see ECHIDNA).

No fossil remains of any animals of this order have as yet been discovered.

MONOTROPA'CEÆ, a small natural order of exogenous plants, allied to *ericeæ* and *pyrolaceæ;* but remarkably differing from both in their habits. They are herbaceous plants with scales instead of leaves, and grow parasitically on the roots of pines and other trees, in the northern parts of the world. The only British species is *monotropa hypopitys*, sometimes called *yellow bird's nest.* The whole plant has a pleasant smell.

MONREA'LE, a city of the island of Sicily, province of Palermo, and 5 m. s.w. of the city of that name, on the flank of a steep hill. Pop. 15,561. It has a cathedral, a palace, several conventual establishments, and possesses a healthy climate. Its chief source of wealth is its export trade in oil, corn, and fruit, almonds being one of its most important products.

MONRO, ALEXANDER, an eminent anatomist, and founder of the medical school of Edinburgh, styled *primus* to distinguish him from his son and successor, was b. at London, Sept. 8, 1697. His grandfather, sir Alexander Monro of Bearcrofts, a colonel in the army of Charles II. at the battle of Worcester in 1651, was afterward an advocate at the Scottish bar; and his father, John Monro, for some years a surgeon in the army of king William, in Flanders, on leaving it, entered into practice in Edinburgh. Alexander studied at London under Cheselden, at Paris under Bouquet, and at Leyden under Boerhaave, and in 1719 passed as a surgeon at Edinburgh. In Jan., 1720, he was elected by the town-council first professor of anatomy in the university. Of the establishment and building of the royal infirmary of Edinburgh, he was one of the two principal promoters, and after it was opened, he delivered clinical lectures there for the benefit of the students. In Jan., 1756, he received the degree of M.D., and in March following was elected a fellow of the royal college of physicians of Edinburgh. In 1759 he resigned the anatomical chair to his youngest son, the subject of the following notice, but continued his clinical lectures at the Infirmary. His principal works are—*Osteology, or Treatise on the Anatomy of the Bones* (Edin. 1726, 8vo); *Essay on Comparative Anatomy* (Lond. 1744, 8vo); *Observations, Anatomical and Physiological* (Edin. 1758, 8vo); and an

Account of the Success of Inoculation of Small-pox in Scotland (Edin. 1765, 8vo). He was secretary of a society at Edinburgh, which published six volumes of *Medical Essays and Observations*, many of them contributed by himself. Two more volumes of *Essays, Physical and Literary*, were subsequently issued by the same society, under the name of the philosophical society. Dr. Monro died July 10, 1767. He was a fellow of the royal society of London, and a member of the royal academy of surgery of Paris.

MONRO, ALEXANDER, *Secundus*, an eminent physician and medical professor, youngest son of the preceding, was b. at Edinburgh, Mar. 24, 1733. He studied at the university of that city; and in Oct., 1755, obtained the degree of M.D. In July following he was appointed joint professor of anatomy and surgery with his father in the university of Edinburgh. He attended for some time the anatomical lectures of prof. Meckell at the university of Berlin. He also visited Leyden. Admitted a licentiate of the Edinburgh royal college of physicians, 1758, he was elected a fellow, 1759, and was afterwards president. On the resignation of his father in the latter year, he became full professor of anatomy, and also succeeded him as secretary of the philosophical society, which in 1783 was incorporated by royal charter, and took the name of the royal society of Edinburgh. In 1757 he published at Berlin a short treatise, *De Venis Lymphaticis Valvulosis*, in support of the theory, that the valvular lymphatics over the whole of the animal body are one general system of absorbents; which led to a controversy with Dr. William Hunter, of London. Among his other works are—*On the Structure and Functions of the Nervous System*, a large illustrated folio volume (Edin. 1783); *On the Structure and Physiology of Fishes*, also an illustrated folio volume (Edin. 1785); *Description of all the Bursæ Mucosæ of the Human Body* (Edin. 1788); and *Three Treatises on the Brain, the Eye, and the Ear*, illustrated by plates (Edin. 1797, 4to). He was a member of the royal academies of Paris, Madrid, Berlin, Moscow, and other learned institutions, and one of the first fellows of the royal society of Edinburgh, to whose *Transactions* he contributed various papers. In 1798 his son, Dr. Alexander Monro, *tertius*, was conjoined with him in the professorship; and in 1808 he finally retired from the anatomical chair, and from his extensive practice. He died Oct. 2, 1817, in his 87th year.

MONRO, ALEXANDER, *Tertius*, anatomical professor, son of Dr. Alexander Monro, *secundus*, born at Edinburgh, Nov. 5, 1773, was educated at the high school and university of that city, and studied medicine, anatomy, and surgery in London. In 1798 he became joint professor of anatomy with his father, and the following year he took his degree of M.D. In 1803 he instituted the class of practical anatomy in the university of Edinburgh, and in 1808 he succeeded his father in the anatomical chair. In 1828 he was president of the royal college of physicians of Edinburgh, and he contributed many valuable papers to its *Transactions*. He was also a fellow of the royal society of Edinburgh. He retired from his chair in 1847, with the title of emeritus professor of anatomy; and thus ended the connection between the college of Edinburgh and the family of Monro, which lasted for more than a century and a quarter. He died at his seat of Craiglockart, near Edinburgh, Mar. 10, 1859. He was the author of *Observations on Crural Hernia*, plates (Edin. 1803); *The Morbid Anatomy of the Gullet, Stomach, and Intestines*, plates (Edin. 1811); *Outlines of the Anatomy of the Human Body* (4 vols. 8vo, Edin. 1813); and other professional works.

MONROE, a co. in s.w. Alabama, n.e. of the Alabama river; 980 sq.m.; pop. '80, 17,091—17,059 of American birth. The surface is diversified, and much of it covered with a growth of pine. The soil is fertile, and well adapted to the raising of Indian corn, which is the principal crop. Next in importance are sweet potatoes and cotton. Considerable quantities of molasses are manufactured from the cane. It is drained by the Alabama river and Limestone creek. Co. seat, Monroeville.

MONROE, a co. in e. Arkansas, n.e. of the White river, 1040 sq.m.; pop. '80, 9,570—5,160 colored. The surface is even, and a large portion of it is cypress swamps. There are extensive forests of hickory, sassafras, and white oak. The soil is fertile, and produces good crops of Indian corn and cotton. Co. seat, Clarendon.

MONROE, a co. in s. Florida, bounded on the n. by the Caloosabatchie river, on the e. by lake Okeechobee, on the s.w. by Ponce de Leon bay, and on the w. by the gulf of Mexico; 3,060 sq.m.; pop. '80, 10,867—3,208 colored. The surface is flat, with a large area of marsh; a part of the everglades lies in it. Most of the Florida Keys and of the Thousand Isles are within the limits of this county, which is the w. portion of the s. end of the Florida peninsula. Large areas are used for pasturage. Little is under cultivation, and the chief produce is sweet potatoes. Co. seat, Key West.

MONROE, a co. in central Georgia, w. of the Ocmulgee, drained by Tobesofka, Towaliga, and Echeconnee creeks, on the Central railroad of Georgia; 370 sq.m.; pop. '80, 18,808—12,112 colored. The surface is uneven and hilly, and the soil generally fertile. Granite, gold, and iron are found. The principal productions are cotton, Indian corn, wheat, oats, and sweet potatoes. Co. seat, Forsyth.

MONROE, a co. in s.w. Illinois, between the Mississippi and Kaskaskia rivers; 360 sq.m.; pop. '80, 13,682. The surface is somewhat uneven. The soil is fertile, and produces large quantities of wheat, Indian corn, oats, and potatoes. There are a num-

ber of flour-mills and harness manufactories. The Cairo and St. Louis railroad passes through it. Co. seat, Waterloo.

MONROE, a co. in s.w. Indiana; area, 420 sq.m.; pop. '80, 15,875—of American birth, 15,577. It is drained by the White river and its tributaries. The surface is uneven, soil fertile, and the principal crops grown are corn, wheat, oats, potatoes, and tobacco. There are a number of saw and flour mills, woolen mills, currying shops, and tanneries. It is on the line of the Louisville, New Albany, and Chicago railroads. Co. seat, Bloomington.

MONROE, a co. in s. Iowa; 430 sq.m.; pop. '80, 13,719—of American birth, 12,227. It is well watered by a number of small streams and creeks. It is largely prairie, with an undulating surface, uneven in some portions. The soil is fertile, and grows large crops of Indian corn. Next in amount are the productions of wheat, oats, butter, hay, and potatoes. There are some saw-mills, flour-mills, and a few smaller manufacturing establishments. It is intersected by the Burlington and Missouri, and Iowa Central railroads. Co. seat, Albia.

MONROE, a co. in s. Kentucky, adjoining Tennessee; 300 sq.m.; pop. '80, 10,742—colored, 660. The surface is uneven. The soil is fertile, and grows, besides tobacco and corn, which are the chief productions, oats, potatoes, and sweet potatoes in considerable quantities. It is watered by the Cumberland river and the source of the Big Barren. Co. seat, Tompkinsville.

MONROE, a co. in s.e. Michigan, along the shores of lake Erie, adjoining Ohio; 540 sq.m.; pop. '80, 33,623. The Huron river flows along its n.e. side. It is watered by the Raisin river, which passes through a fertile valley, with fine scenery. The most important productions are Indian corn, wheat, oats, wool, potatoes, butter, and hay. There are a number of saw-mills, carriage manufactories, and tanneries. There are also flour-mills, brick-yards and manufactories of agricultural tools. The Flint and Pere Marquette, the Lake Shore and Michigan Southern, and the Canada Southern railroads pass through it. Co. seat, Monroe.

MONROE, a co. in n.e. Mississippi, having the state line of Alabama for its e. boundary, and a branch of the Tombigbee river for its s.w., is drained by that river, intersecting it centrally, and traversed by the Mobile and Ohio railroad; 800 sq.m.; pop. '80, 28,553—28,419 of American birth, 18,004 colored. Its surface is generally level, in some localities low and swampy, in others covered with dense forests of hard wood, interspersed with groves of magnolia, tulip-tree, beech, and elm. Its soil is a calcareous loam, very fertile, and adapted to the raising of live-stock, and the production of wheat, corn, sweet potatoes, cotton, and dairy products. Co. seat, Aberdeen.

MONROE, a co. in n.e. Missouri; 744 sq.m.; pop. '80, 19,071. It is well watered by the Salt river and its tributaries. It is principally a fertile, rolling prairie. Great crops of corn are grown, and wheat, oats, butter, hay, tobacco, and wool, are raised in quantities. Rich veins of coal, limestone, and freestone are found. Agriculture is the principal business, and manufacturing has not been much developed. It is on the line of the Missouri division of the Missouri, Kansas and Texas railroad. Co. seat, Paris.

MONROE, a co. in w. New York, having lake Ontario for its n. boundary; 682 sq.m.; pop. '80, 142,660. It is drained by the Genesee river, the Irondequiot, the Honeoye, and other small streams. It is intersected centrally by the Erie canal, crossing the Genesee river, and the Genesee Valley canal, by the New York Central and Hudson River railroad, the Rome, Watertown and Ogdensburg, and the Rochester division of the New York, Lake Erie and Western railroad. Its surface is generally level, sloping towards the water, and well wooded, Its orchard products are very considerable, and fruit and ornamental trees, apples, and wool are among its exports. Iron is mined; other mineral deposits are Medina sandstone, Silurian limestone, gypsum, and water-lime. Its domestic trade is important and its commercial facilities render its foreign commerce of great value. Its unlimited water power is utilized by factories, and among its vast industries are the manufacture of ready-made clothing, boots and shoes, cigars, hats and caps, steam-engines, bank locks, machinery, etc. At its county seat are the Leighton iron bridge works; and its flour mills grind millions of bushels of wheat annually. Co. seat, Rochester.

MONROE, a co. in s.e. Ohio, on the Ohio river; 420 sq.m.; pop. '80, 26,497—24,500 of American birth. The surface is uneven, heavily wooded, and contains deposits of coal. Iron is found in some parts. The soil is fertile, and the chief staples are tobacco and corn. The productions next in importance are oats, wheat, potatoes, hay, butter, and wool. Large quantities of cheese are manufactured. There are saw and planing mills, tanneries and currying shops, furniture factories and flour-mills. Co. seat, Woodsfield.

MONROE, a co. in e. Pennsylvania, having the Delaware river for its s.e. boundary, separating it from New Jersey, a range of the Blue mountains for its s., and the Lehigh river for its n.w. boundary; about 680 sq.m.; pop. '80, 20,175—19,320 of American birth, 155 colored. It is intersected by the Delaware, Lackawanna and Western railroad. Its fertile valleys are interspersed with elevations in some localities, and diversified by forests

of hickory, walnut, etc. It is drained by Brodhead's and Tobyhanna creeks; limestone and slate are quarried. It contains the charming summer resort of Delaware Water Gap, where the Delaware river breaks through the Blue ridge through a gorge two or three miles long, whose sides rise 1400 feet above the level of the water. The surrounding country is noted for its picturesque scenery. Its soil, on a limestone foundation, produces all the vegetable, orchard, and dairy products common to the middle states. Lumber is one of its chief commodities, and leather and flour are manufactured. Among its manufactories are woolen-mills and tanneries. Co. seat, Stroudsburg.

MONROE, a co. in s.e. Tennessee, next to North Carolina; 550 sq.m.; pop. '80, 14,283—1291 colored. The surface is uneven and hilly, and the soil generally fertile in the valleys. Portions are heavily wooded. Wheat, oats, pork, and Indian corn are the chief products. It is on the East Tennesee, Virginia and Georgia railroad. Co. seat, Madisonville.

MONROE, a co. in s.e. West Virginia, having for its s. and s.e. boundary a ridge of the Alleghany mountains, the Kanawha river crossing its extreme n. section and a portion of its s.w.; 500 sq.m.; pop. '80, 11,501—11,446 of American birth, 1131 colored. It is intersected by the Chesapeake and Ohio railroad. Its surface, generally mountainous, is drained by the Greenbrier river, and the New river forming part of its w. boundary. It is largely covered with forests of hardwood diversified by groves of sugar-maple, Its soil is very fertile, producing grain, tobacco, wool, and the products of the dairy, and is highly esteemed for its good pasturage and facilities for stock-raising. Red sulphur and white sulphur springs are found in the s. section. Co. seat, Union.

MONROE, a co. in s.w. Wisconsin; 900 sq.m.; pop, 21,606. The surface is rolling and irregular. The soil is fertile, producing, in large quantities, corn, wheat, oats, potatoes, and hay. Large amounts of wool and butter are made. Many tons of hops are annually gathered. There are a number of saw and flour mills, and many miscellaneous manufactories, as cooper, machine, and carriage shops, and paper and clothing mills. The La Crosse, Kickapoo, Lemonweir, and other rivers pass through it. It is on the line of the Chicago, Milwaukee and St. Paul, and of the West Wisconsin railroads. Co. seat, Sparta.

MONROE, a city of Michigan, United States, is situated on the river Raisin, 2 m. from Lake Erie, and 32 m. s.w. of Detroit. It is the eastern terminus of the Michigan Southern railway. It has a large court-house, 7 churches, woolen manufactories, flour-mills, etc. Pop. '80, 4,930. Monroe was settled by the French in 1776.

MONROE (*ante*). This pleasant old French town in Michigan, though left behind by the cities of Toledo, south, and Detroit, north, remains the seat of a young ladies' seminary, of several prosperous manufacturing industries, and extensive nurseries, and makes moderate shipments of produce, sand for glass-making, etc. It was settled under the name of Frenchtown, by French from Detroit, in 1784. The battle of the river Raisin, between the English and their Indian allies and an American force, occurred near Monroe in 1813, resulting in the massacre of several hundred American prisoners.

MONROE, JAMES, fifth president of the United States, was b. in Westmoreland co., Virginia, April 28, 1758. He was descended from a captain Monroe of the army of Charles I., who emigrated, with other cavaliers, to Virginia. James Monroe entered the revolutionary army at the age of 18, as a cadet, and was present at several battles; but having lost his rank in the army by serving as aid-de-camp, he commenced to study law with Jefferson. In 1782 he was elected to the assembly of Virginia, and at the age of 23 to the executive council. Next year he was elected to eongress, where he took an active part in the movements for framing a new constitution. He joined with Patrick Henry and other leading states' rights men in opposing the ratification. He feared the power and encroachment of the federal government. He was afterwards sent by Washington as minister to France, and was received with singular enthusiasm by the revolutionary government. He was, however, soon recalled, for having too decided French sympathies. In 1799 he was elected governor of Virginia; and in 1803 sent by Jefferson as minister to France, to purchase Louisiana, which vast territory he secured for 15,000,000 dollars. He was now employed for several years in diplomacy in England and Spain. On the election of Mr. Madison to the presidency, he was made secretary of state, and also performed the duties of secretary of war. In 1816 his eminent services were rewarded by his being elected president of the United States by the democratic-republican party, and he made himself very popular. The acquisition of Florida from Spain, and the settlement of the vexed question respecting the extension of slavery by the Missouri compromise, by which, after the reception of Missouri as a slave state, the institution was prohibited above the line of latitude 36° 30′, helped to secure his re-election in 1820. His most popular acts, perhaps, were the recognition of the independence of Mexico and the South American republics, and the promulgation of what has since been called the "Monroe doctrine," in which he declared the American policy of "neither entangling ourselves in the broils of Europe, nor suffering the powers of the old world to interfere with the affairs of the new," and that "any attempt to extend their system to any portion of this hemisphere would be dangerous to our peace and safety." In 1825 he retired to his seat at Oak Hill, Loudon co., Virginia; but he still

continued in the public service. After being twice president, he acted as justice of the peace, a visitor of the university of Virginia, and member of a state convention; but a profuse generosity and hospitality caused him to be overwhelmed with debt, and he found refuge with his relations in New York, where he died in 1831—like his predecessors, Adams and Jefferson, on July 4. He was an honorable and able statesman, though not a speaker or a man of brilliant talents.

MONROE DOCTRINE, a scheme of public policy, named after its author, James Monroe, fifth president of the United States of America, by whom it was enunciated in his message to congress, Dec. 2, 1823. Mr. Monroe set forth in his message that "as a principle, the American continents, by the free and independent position which they have assumed and maintained, are henceforth not to be considered as subjects for future colonization by any European power;" and that any attempt on the part of the European powers to "extend their system to any portion of this hemisphere" would be regarded by the United States as "dangerous to our peace and safety," and would be opposed accordingly.

MONS (Flem. *Berghen*), an important t. of Belgium (formerly fortified), capital of the province of Hainault, on the Trouille, 35 m. s.w. of Brussels. Its fortifications were renewed and strengthened since 1818, but in 1866, in accordance with the new arrangement for the defense of the country, they were demolished. The immediate vicinity can be laid under water by altering the course of the Trouille. The *canal de Condé* connects the town with the Scheldt, and there is communication by railway with Brussels, Valenciennes, Charleroi, etc. Its principal architectural ornament is the cathedral of St. Waudru, dating from the 15th and 16th centuries—a masterpiece of Gothic. The chief manufactures are woolen and cotton goods, cutlery, small-wares, and sugar refining. The vicinity forms an extensive coal-field, with about 400 pits. A large trade is carried on in coals, flax, hemp, horses, and cattle. Pop. '75, 24,539.

Mons, supposed to occupy the site of a Roman station, was made the capital of Hainault by Charlemagne in 804. During the 17th and 18th centuries, it was frequently the object of contest between France and Austria.

MONSEIGNEUR, a French title, compounded of the words *mon* and *seigneur*, meaning my lord, applicable to royal or imperial princes, cardinals, archbishops and bishops of France, and accorded in courtesy to the high officers of government, and persons generally of high rank. Its plural is *messeigneurs*. Abbreviations *mgr.*, *mgrs.* The title was not applied to bishops until about the close of the 17th c., when they acquired it by concerted action in addressing each other in that way. Their title previously was simply *monsieur*. A law of the French convention in 1801 interdicted the use of the title to bishops and archbishops, and required them to confine their signature titles, and their addresses to each other to the words *citoyen* or *monsieur*. In the language of French thieves *monseigneur* is applied to a tool used to break locks.

MONSELI'CE, a walled t. of North Italy, 13 m. s.e. of Padua, on the canal of Monselice, which extends from Padua to Este. Monselice was a place of importance in the middle ages. It has several silk-mills. Pop. 3,160.

MONSIEUR, plural *messieurs*, a French title formerly addressed to persons of medium rank, and corresponding to sir or my sir in English; now universally employed in French by all gentlemen in addressing each other. It is also used as a prefix to titles of rank, as *monsieur le prince, messieurs les députés, monsieur le préfet;* and as a form of respect in mentioning a third person without regard to rank, as *monsieur votre frère, monsieur votre voisin*, etc. In the middle ages the title was given to saints, as *monsieur saint Pierre, monsieur saint Jean*, etc., and also in the same manner applied as a prefix to the names of popes and of members of the royal family when alluded to in the third person. It was the special title of the oldest brother of the French king, the duke of Orleans, who was specifically indicated when one spoke simply of *monsieur*. The title is dropped before the names of persons of great fame, as belittling when speaking of them, as Lamartine, Carnot, etc.

MONSON, a t. in Hampden co., Mass., 15 m. e. of Springfield; pop. '80, 3,578. It contains manufactories of hats and bonnets, and woolen goods, a national bank, 3 churches, an academy, and a state school for the children of alien paupers. The Boston and Albany, and New London Northern railroads pass through it. The Monson academy has long had a high repute, attracting students in preparation for college from distant places; and noted for its moral and religious influence. Many men of eminence have gained here the foundation of their education. It was one of the schools chosen for the education of the youth sent to this country for study, and supported here, by the Chinese government.

MONSOON (Malayan, *musim*) is derived from the Arabic word *mausim*, a set time or season of the year, and is applied to those winds prevailing in the Indian ocean which blow from the s.w. from April to October, and from the opposite direction, or n.e., from October to April. The existence of these winds was made known to the Greeks during the Indian expeditions of Alexander, and by this knowledge, Hippalus was emboldened to sail across the open sea to Muzeris, the emporium of Malabar. The monsoons depend, in common with all winds, whether regular or irregular, on the inequality of heat at dif

ferent places and the earth's rotation on its axis; but more particularly they are occasioned by the same circumstances which produce the trade-winds and the land and sea breezes, being, in fact, the combined effect of these two sets of causes.

If the equatorial regions of the earth were entirely covered with water, the trade-winds (see TRADE-WINDS) would blow constantly from the n.e. in the n., and from the s.e. in the s. of the torrid zone, with a belt of variable winds and calms interposed; the whole system, following the sun's course, moving northward from December to June, and southward from June to December. But, especially in the eastern hemisphere, large tracts of land stretch into the tropics, and give rise to the extensive atmospheric disturbances for which those parts of the earth are so remarkable. During the summer half of the year, the n. of Africa and the s. of Asia are heated to a higher degree than the Indian ocean, while Australia and South Africa are much colder. As the heated air of southern Asia expands and rises, and the colder air from the s. flows in to supply its place, a general movement of the atmosphere of the Indian ocean sets in towards the n., thus giving a *southerly* direction to the wind; but as the air comes from those parts of the globe which revolve quicker to those which revolve more slowly, an easterly direction will be communicated to the wind; and the combination of these two directions results in the s.w. monsoon, which prevails there in summer. Since, during winter, South Asia is colder than the Indian ocean, which, again, in its turn, is colder than South Africa, a general motion of the atmosphere sets in towards the s. and west. As this is in the same direction as the ordinary trade-wind, the effect in winter is not to change the direction, but only to increase the velocity of the trade-wind. Thus, while s. of the equator, owing to the absence of sufficiently large tracts of land, the s.e. trade-winds prevail throughout the year; on the n. of the equator we find the s.w. monsoon in summer, and the n.e. in winter; it being only in summer and n. of the equator that great changes are effected in the direction of the trade-wind.

Similar though less strongly-marked monsoons prevail off the coasts of Upper Guinea in Africa, and Mexico in America. The e. and w. direction of the shores of these countries, or the large heated surfaces to the n. of the seas which wash their coasts, produce, precisely as in the case of South Asia, a s.w. monsoon in summer. As might have been expected, the monsoon off the coast of Mozambique is easterly, and that off the coast of West Australia north-westerly. The trade-winds also suffer considerable change in their direction on the coasts of Brazil, Peru, Lower Guinea, etc These, though sometimes considered monsoons, are not truly such, for they do not change their directions periodically, so as to be opposite to each other, like true monsoons, but only veer through a few points of the compass. For a fuller account of these partial deflections, see TRADE-WINDS.

In April, the n.e. monsoon changes into the s.w.; and in October, the s.w. into the n.e. These times depending on the course of the sun, and consequently varying with the latitude, are called the breaking up of the monsoons, and are generally accompanied by variable winds, by intervals of calm, and by furious tempests and hurricanes.

Monsoons, when compared with the trade-winds, will be found to play a most beneficial and important part in the economy of the globe. Their greater velocity, and the periodical changes which take place in their direction, secure increased facility of commercial intercourse between different countries. But the full benefits following in their train are not seen unless they be considered in their relation to the rain-fall of southern Asia. Indeed, the fertility of the greater part of this fine region is entirely due to the monsoons; for if the n.e. trade-wind had prevailed there throughout the year, central and western India, and many other places, would only have been scorched and barren saharas. The rain-fall of India depends entirely on the monsoons. The coast of Malabar has its rainy season during the s.w. monsoon, which brings thither the vapors of the ocean. On the Coromandel coast, on the other hand, it is the n.e. monsoon which brings the rain from the bay of Bengal. The two coasts of Hindustan have therefore their seasons reversed, the dry season of the one corresponding with the wet season of the other.

MONSTER. See MONSTROSITY, in anatomy.

MONSTRANCE (Lat. *monstrare*, to show), called also OSTENSORY, the sacred utensil employed in the Roman Catholic church for the purpose of presenting the consecrated host for the adoration of the people, as well while it is carried in procession, as when it is exposed upon the altar on occasions of special solemnity and prayer. The use of the monstrance probably dates from the establishment of the festival of Corpus Christi in the 13th century. It consists of two parts, the foot or stand upon which it rests, and the repository or case in which the host is exhibited. The latter contains a small semicircular holder called the *lunula*, or crescent, in which the host is fixed; and it appears anciently to have been of a cylindrical or tower-shaped form, in the central portion of which, consisting of a glass or crystal cylinder, the host was placed. At present it is more commonly in the form of a star or sun with rays, the central portion of which is of glass or crystal, and serves to permit the host to be seen. This portion, or at least the crescent, is of gold or of silver gilt; the rest is generally either of the precious metals, or at least gilt or silvered, although the lower portion is occasionally of bronze artistically wrought. In many cases it is of most costly materials and workmanship. The mon-

strance, like the other vessels used in the Eucharistic service, is consecrated by a bishop, or a priest deligated by a bishop. By a peculiar usage of the city of Lucerne, in Switzerland, the Eucharist is always carried in the monstrance, when being borne to the sick.

MONSTRELET, Enguerrand de, 1390–1453; a chronicler following immediately after Froissart, and with less charm of narration; the first clear, reasoning, and exact collector of the facts of the history of his time. In 1430 he had a civil and military function in Compeigne, and was afterwards present at the interview between Jean d'Arc and the duke of Burgogne. His chronicles of the 15th c. were republished in 7 vols., Paris, 1857.

MONSTROSITY, in anatomy. When an infant, or the young of any animal, comes into the world impressed with morbid changes, which occur only in fetal life, and of which it has never been observed that they have originated in the same way after birth, such an infant or young animal is said to be a monster or monstrosity. Monsters were formerly regarded as prodigies of nature; and in the dark ages their occurrence in the human species was usually ascribed to the intercourse of demons and witches. It is now perfectly understood that the formation of those apparently anomalous beings may be accounted for by the same laws as those which govern the formation of perfect individuals—the only difference being that these laws in the case of monstrosity are more or less arrested or otherwise perverted.

Amongst the principal causes of monstrosity may be mentioned: 1. Something deficient or abnormal in the generative matter of one or both parents, because, as has been shown in the article Hereditariness, malformations are frequently transmitted from parents to the children. Here the morbid change is impressed upon the fetus at the moment of impregnation. 2. Some morbid condition of the maternal organs or constitution may exercise a disturbing influence on development. 3. Diseases and abnormal states of the placenta, of the membranes of the ovum, and of the umbilical cord, may induce an arrest of development; for example, it may be easily understood how abnormal shortness of the cord may favor the origin of fissure of the abdomen; while a cord of disproportional length may coil round one of the extremities, and by constriction may dwarf it, or even amputate it. 4. Morbid influences acting directly on the fetus, as mechanical injuries and diseases affecting it, are the most frequent causes of malformations. From the experiments of several observers, it has been shown that by submitting hens' eggs to various mechanical influences during incubation, the development of the embryo may be interrupted, or modified in such a manner as to give rise to malformations; and many observations tend to prove that mechanical influences affecting the womb (kicks, blows, or falls) in the early months of pregnancy, produce certain malformations, by causing an arrest of development. Moreover, the fact that certain malformations usually occur only in twin or triplet pregnancies, favors the view that certain monstrosities are due to pressure and confined space.

Of the various classifications of monstrosities, the following is perhaps the best: 1. Malformations in which certain parts of the normal body are entirely absent, or are too small. 2. Malformations produced by fusion or coalescence of organs. 3. Malformations in which parts naturally united, as in the mesial line of the body, are separated, and clefts or fissures occur. 4. Malformations in which natural openings are closed. 5. Malformations of excess, or in which certain parts have attained a disproportional size. 6. Malformations in which one or more parts have an abnormal position. 7. Malformations of the generative organs.

The *first class* includes (1) completely shapeless malformations, in which the monster presents the appearance of a lump or mass, with no indication of definite organs; (2) malformations which consist of only a more or less rudimentary trunk, with no head or extremities; (3) trunkless monsters, in which the inferior parts of the body are wanting, and little more than a rudimentary head is present, which, instead of neck and trunk, is furnished with a pouch-like appendage, containing rudimentary viscera and pieces of bone; (4) malformations in which the head, and sometimes a part of the upper part of the body, are wanting, constituting acephalic monsters, which are by no means rare, the number of recorded cases in the human subject being over 100; (5) malformations in which the whole head is not absent, but some of its component parts are wanting—as, for example, the brain, some of the cranial bones, the nose, or the eyes; (6) cases in which the extremities are absent or imperfect to a greater or less degree—for example, they may be mere stumps, with the fingers and toes either absent or rudimentary, or the hands and feet may appear to exist independently of arms and legs, and to be inserted immediately into the trunk; (7) cases in which all the organs may be present, but some of them may be too small—thus, there may be general dwarfishness, or the head or limbs may be abnormally small. None of the monsters of this class, except those included in the last two groups, are viable.

In the *second class* are included such cases as (1) the various forms of *cyclopia*, or coalescence of the eyes; these malformations are not very rare in the human subject, and are of frequent occurrence in pigs and other animals; although usually born alive, these monsters are not viable; (2) coalescence of the lower extremities either into a common limb, which supports two feet, or into an undefined tail-like mass; (3) minor amal-

gamations, which do not affect vitality, as more or less perfect coalescence of the fingers and toes.

The *third class* embraces such cases as (1) fissures of the cranium, which are generally due to hydrocephalus in the fetus; (2) harelip and cleft palet; (3) fissures on the neck, whose origin is due to the respiratory clefts—which, during the formation of the embryo, appear in the cervical region, not uniting at an early stage, as in the normal condition, but remaining more or less open; (4) fissures of the vertebral arches of the spinal column, occasioning the affection known as *spina bifida;* (5) fissures of the thorax, in which case the lungs or heart are more or less exposed; (6) fissures of the abdomen.

The malformations of the *fourth class* include congenital closure of the anus, the mouth, the nostrils, etc.

The malformations of the *fifth class* may be arranged in two divisions, according as certain parts are too large, or there are supernumerary organs.

The *sixth class* is very extensive, and embraces many varieties. One or more parts may be disproportionately large—as, for example, the head in cases of congenital hydrocephalus; or there may be one or several supernumerary organs—a sub-class which presents a very great range, from the simplest cases, in which a single joint of a finger is supernumerary, to those of a highly complicated nature, when two or even three bodies are united by some one point. There may be a single head and trunk and supernumerary parts—as, for example, supernumerary teeth, vertebræ (giving rise to the formation of a tail in the human subject), ribs, mammæ, fingers, toes, etc.; or there may be malformations with more than one head and trunk—double, or even triplet monsters. This sub-class is divisible into two groups, according as the united individuals are equally developed, or as only one is developed; the second being more or less atrophied, and forming a parasitic appendage to the first. As examples of the first group, we mention (1) duplication of the head and upper part of the vertebral column; (2) duplication of the head, neck, and upper extremities, while the chest and abdomen are single, or fused into one another (in this group, we must place the twin-monster Rita Christina, who was born in Sardinia in Mar., 1829, and was brought alive to Paris, where she died in the November of that year); (3) almost complete duplication, with separation of the two bodies, except at a single spot, as in the case of the Siamese twins; (4) triplet monsters, such as the child with three heads born in 1832 in Catania (see Geoffroy St. Hilaire, *Histoire des Anomalies de l'Organisation,* vol. iii. p. 327). To the second group belong such cases as the following: (1) a perfect individual may bear on its head another head, with traces of the rest of the body; (2) on a well-developed body, a second, smaller and defective one, may be situated, which, after birth, does not increase in size; (3) in a more or less perfectly developed individual, there may be concealed, commonly in the abdomen, parts of a second individual—a condition which has received the name of *fœtus in fœtu,* and which is most probably caused by the inclusion of one germ by another.

To the *sixth class* belong (1) those cases in which there is a reversing of the position of the internal organs—when the heart and spleen lie upon the right, and the liver and cæcum on the left side; (2) anomalies in the course and distribution of individual vessels.

The malformations constituting the *seventh class* have been sufficiently noticed in the article HERMAPHRODITISM.

The term *teratology* (from the Greek words *tĕras,* a prodigy, and *lŏgos,* a discourse) is now frequently applied to the history and science of monstrosities. For further information on this subject, the reader is referred to Geoffroy St. Hilaire, *Histoire des Anomalies de l'Organisation* (3 vols. 1832–36); Otto, *Monstrorum Sexcentorum Descriptio Anatomica* (1841); and to the article "Teratology," by Vrolik, in *The Cyclopædia of Anatomy and Physiology.*

MONSTROSITY, in botany, is a malformation or abnormal development of any part of a plant. It may take place, however, at any period of the growth of a plant, as to any new organ that is developed, and sometimes merely affects a particular organ or some portion of a plant, as a particular leaf, flower, petal, sepal, etc., or the leaves or flowers of a particular branch, while in other cases all the organs of the same kind exhibit the same abnormal character. As in animals, it is now well known that monstrosities in plants are the result of special conditions affecting the operation of ordinary natural laws; and the study of monstrosities is very important in relation to that of the nature, development, and metamorphosis of organs. In the article METAMORPHOSIS OF ORGANS, some of the most frequent monstrosities are alluded to. Monstrosities in plants are not always, as in animals, reckoned deformities *Double flowers* afford a familiar example of an opposite kind; although with regard to the plant itself they have the effect of unfitting it for one of the functions of a perfect plant, reproduction by seed.

MONTAGNA'NA, a t. of northern Italy, in the province of Padua, situated pleasantly on the banks of a canal, Il Fiumicello, 32 m. s.w. of Padua. It is still protected by walls and towers, and has a fine cathedral and palace. Pop. 7,657. Its chief trade is in spun-silk, wool, hemp, and coarse cotton textures.

MONTAGNARDS, or simply MONTAGNE, "the Mountain," the name given to the extreme democratic politicians in the first French revolution, because they seated themselves on the higher benches of the hall in which the *national convention* met. Their

principal members were Danton, Marat, Robespierre, St. Just, and Collot d'Herbois, the men who introduced the "reign of terror." The opposite party of the "plain" (*plaine*) were the Girondists (q.v.), who sat on the lowest benches on the floor of the house. After the overthrow of the Girondists, this part of the house was styled the "marsh or swamp" (*marais*), and included all the subservient members whose votes were under the control of "the Mountain." A few leading men gave all its strength and formidable character to the party o fthe Mountain. After 1848, the extreme party in the *national assembly*, composed of revolutionary democrats and communists, sometimes flattered itself with the designation of "the Mountain;" but events proved that it possessed nothing of the genius, though it showed all the malignity of its terrible predecessor.

MONTAGU, Family of. This noble family are said, by Burke, to derive their name, which in Latin was and is always written De Monte Acuto, from a place in Normandy; and the first of the Montagus who settled in England was a warrior who came over in the train of Robert earl of Moreton at the conquest. Five centuries later, we find his descendant, sir Edward Montagu, lord chief-justice, in succession, of the courts of king's bench and common pleas under Henry VIII., who also appointed him one of the executors of his will and guardians of his son Edward. His grandson, who was a distinguished orator, represented the city of London in Parliament; and having been lord chief-justice of the court of king's bench, and lord treasurer of the kingdom, was raised to the peerage as earl of Manchester. The second earl gained distinction as a general in the parliamentary army, and more particularly by his victory over Prince Rupert at Marston Moor; but he scrupled to take part in the condemnation and execution of Charles, and was one of the first members of the house of peers who gave in his adhesion to Charles II. on his restoration. This nobleman's grandson enthusiastically espoused the cause of William III., under whom he fought at the battle of the Boyne, and took part in the siege of Limerick. He was subsequently sent as ambassador to Venice and to the courts of France and Vienna, and eventually was raised to the dukedom of Manchester by George I. The title is still enjoyed by his descendant, the 7th duke. Other branches of the Montagu family were ennobled in the persons of the earl of Sandwich, the earl of Halifax, and the duke of Montagu, but the last two titles both became extinct before the close of the 18th century.

MONTAGU, Basil, 1770–1851; b. London. He was the son of John Montagu, fourth earl of Sandwich, and of Miss Ray, who was shot in 1779 in the piazza of Covent garden by the rev. James Hackman in a fit of jealous frenzy. He received his early education at the Charter House school in London, and took the degree of M.A. at Cambridge in 1790, distinguishing himself by his love of literature; entered Gray's Inn, and was admitted to the bar in 1798. While in London he became intimate with Coleridge, and adopting the opinions of Godwin, determined to abandon the law, but was dissnaded by sir James Mackintosh. He was a copious and able writer. The most important of his works is a *Digest of the Bankrupt Laws*, in 4 vols., for which he obtained in 1806 the office of commissioner of bankruptcy. This became a standard work and passed through many editions. Hs was distinguished for his efforts to mitigate the severity of the penal code. He wrote several pamphlets on capital punishment, and with Wilberforce, Romilly, and others succeeded in obtaining the abolition of hanging for forgery. He edited Bacon's works in 16 vols. He published 40 vols., and left 100 more in manuscript.

MONTAGU, Edward Wortley, 1713–76; b. Wharncliffe, Yorkshire, Eng., only son of Edward Wortley and lady Mary. When very young he ran away from Westminster school repeatedly, gave himself up to the lowest vices, and hired himself out as a cabin boy in a ship sailing for Spain, where he was discovered by the British consul at Cadiz, and restored to his family. He was then committed to the charge of a private tutor who obtained for him an appointment to a public office. He was then sent to travel on the continent under the care of the tutor, and while abroad he published his first work, *Reflections on the Rise and Fall of Ancient Republics*. While at Paris he became involved in an altercation with a Jew which led to a criminal prosecution. On his return to England he married, while still under age, a woman much older than himself, and in a few weeks deserted her. Notwithstanding his profligacy he obtained a seat in parliament in 1847, and was re-elected, until being involved in debt by his extravagance he was forced to resign. He again went abroad, never returning to England. He proceeded first to Italy, became a convert to popery, and then went to Egypt where he turned Mohammedan. He spent the remainder of his life in the Levant, having been in the mean time disinherited by his parents, but was on his way back to England when he died at Padua. Besides the tract before mentioned he wrote another, entitled *An Examination into the Cause of Earthquakes*, and contributed some papers to the *Philosophical Transactions*. His tract on *Ancient Republics* was claimed as the production of Mr. Foster, his tutor.

MONTAGU, Elizabeth Robinson, 1720–1800; b. York, Eng.; was married in 1742 to Edward Montagu, grandson of the first earl of Sandwich, who on his death left her a large fortune. With abundance of wealth, and possessing literary talent, she became a leader in London society, and her residence was the favorite resort of literary persons. For several years she gave annual dinners on May-day to the chimney-sweeps

of London. She wrote three *Dialogues of the Dead*, published in lord Lyttleton's work by that name, and an *Essay on the Writings and Genius of Shakespeare, compared with the Greek and French Dramatic Poets.* She is well known by her correspondence in 4 vols.

MONTAGU, Lady Mary Wortley, was eldest daughter of Evelyn, earl, and afterwards (1715) duke of Kingston. She was born about 1690, and is said to have received a classical education. When only eight years of age she was introduced by her father to the famous *Kit-Cat club*, and formally admitted a member. Her fond pleasure-loving father allowed her to educate herself. She is even said to have taught herself Latin. She became attached to Mr. E. Wortley Montagu, a member of the house of commons, whose cousin, Charles Montagu, was created earl of Halifax, and appointed first lord of the treasury, by George I. As the match was disapproved of by the families, she was obliged to elope before she could marry him. On the accession of George I. she came to London with her husband, who was a whig. Lady Mary's beauty and wit attracted universal admiration at court. She was in habits of familiar acquaintance with Addison and Pope, the latter becoming her enthusiastic admirer, and writing "flames and raptures" for her, until his passion "came to a climax in an impertinence, and was extinguished by a box on the ear, or some such rebuff." In 1716 Mr. Wortley Montagu was appointed ambassador to Constantinople. He was accompanied by lady Mary, who, on her journey, and during her residence in the Levant, wrote the well-known *Letters*, which form one of the most delightful books in our language. The weaknesses of a somewhat vain and capricious temper fade into forgetfulness, when we remember the strong sense, enlightened courage, and generous perseverance which introduced into Europe the practice of inoculation, which she witnessed in Turkey. She had so much faith in its safety, that she tried it first on her own son. See Inoculation. After her return to England she fixed her residence at Twickenham, and renewed her intimacy with Pope. But political soon led to personal differences, and these resulted in one of the most famous literary feuds of the 18th century. The immediate occasion of it was the publication by lady Mary of her *Town Eclogues.* She was fiercely assailed by both Swift and Pope, and was not slow to retaliate. In 1737 she left her country and her husband (for reasons that are not known), and lived for many years in Italy, chiefly at Lovero, in the province of Venice. Her husband died in 1761. At the request of her daughter, afterwards wife of the earl of Bute, she returned to England, where she died 21 Aug., 1762. A collected edition of her works, with life, was published by her great-grandson, the late lord Wharncliffe, in 1836, of which a third edition appeared in 1861.

MONTAGUE: a tp. in Franklin co., Mass. Pop. '80, 4,875.

MONTAGUE, a co. in n. Texas, bounded on the n. by the Red river, which separates it from the Indian territory, and drained by the Denton fork of Trinity river, and by Clear creek; 850 sq.m.; pop. '80, 11,257—11,162 of American birth. The soil in the vicinity of Red river is good. Cattle raising is the chief business. Co. seat, Montague.

MONTAGUE, Charles. See Halifax, Earl of, *ante.*

MONTAJONE, a t. in n. Italy, near the sea, about 25 m. s.w of Florence, having mineral springs celebrated for their medicinal properties; pop. 10,556. It is in a province of the same name.

MONTAIGNE, Michel Eyquem de, a distinguished French moral philosopher, was b. in 1533, at his paternal home of Montaigne, in Perigord. In accordance with his father's eccentric ideas on education, he was taught, and suffered only to speak Latin from his earliest infancy, in consequence of which he acquired such a perfect mastery over the language, that when, in his tenth year, he entered the college of Bordeaux, his masters, Grouchi, Buchanan, and Muret, were almost afraid to address him. On the expiration of his course of studies, which were directed to law, he received, in 1554, the appointment of councilor in the parliament of Bordeaux; but being possessed of ample means, and having no inclination for a public life, he devoted himself to the study of the various schools of Greek and Roman philosophy; and on the death of his father, in compliance with whose wish he had made a translation of the natural theology of Raymundus Sebondus (Paris, 1569), he retired to his ancestral estate, where he lived in retirement during the terrible season of religious oppression which desolated France for so many years. During this period, 1580, he composed the first two books of his celebrated *Essais*, the third portion of which appeared in 1588, after his return from an extensive course of travels, which he had undertaken partly to escape from the plague, and partly for the improvement of his own health, and during which he visited Rome, and was received with signal favor by the pope. Montaigne's *Essais*, although not conceived in the spirit of a believing Christian, or marked by the reticence and delicacy of expression which modern refinement demands, are very extraordinary productions, not only for the learning and sound reasoning which they manifest, but also for the frank and liberal tone in which social questions are discussed, notwithstanding that the author wrote at a period when religious differences and party feelings blinded the judgments of men. Montaigne's ethics were those of Seneca and the other philosophers of ancient times, whose works he had so thoroughly mastered; and, judged from our point of view, his morality is that of a virtuous pagan merely; but when we bear in mind the turmoil of civil war, and the

consequent disorganization of society, together with the low ebb of literature in France at that period, we must do justice to the great merit of the writer, and the influences for good which his writings exerted. Montaigne was a constant, and occasionally a successful mediator between the party of Henry of Navarre and that of the Guises, and stood in relations of friendship with men of all creeds. He died in 1592 as an avowed member of the Church of Rome, in whose doctrines he professed implicit faith, notwithstanding the sceptical bias which he had through life been at no pains to conceal. Numerous editions have appeared of his *Essais*, among which we may instance those of De Coste (5 vols. Hag. 1727), and Victor Leclerc (Paris, 1826). Nearly 200 years after his death, the discovery was made at Montaigne of the MS. of his travels, which was was published at Paris in 1774 under the title of *Journal de Voyage de M. de M. en Italie par la Suisse et l'Allemagne.* Translations of the *Essais* exist in almost all the European languages; the best English translation is that by Cotton. The best biographies of Montaigne are by Grün (Paris, 1855); Payen (Paris, 1856); and Bayle St. John (Lond. 1857).

MONTALCI'NO, a t. in the province of Siena, Central Italy, 22 m. s.s.e. of the town of Siena, stands on a hill in the midst of valleys, and enjoys a fine equable climate. Pop. 7,540. The wine of Montalcino is in high repute throughout Tuscany.

MONTALEMBERT, Charles Forbes, Comte de, was b. in April 1810 of an ancient family of Poitou. His father was created a peer of France under the Restoration, and for a considerable time was minister of the French court in Sweden. His mother was of the Scottish family of Forbes, to which circumstance may be aseribed Montalembert's remarkable familiarity with the English language, and his intimate knowledge and strong admiration of the social and political institutions of England. Although his more advanced studies were carried on in the university of Paris, a considerable part of his youth was spent in Sweden; and the first work by which he was brought into notice, was a pamphlet on Sweden, which he published in his nineteenth year. On the death of his father, Montalembert succeeded to his honors, and to his seat in the Chamber of Peers. But his earliest public appearance was in what may be truly considered as the great labor of his life, a joint effort in which he associated himself with the Abbé Lacordaire (q.v.) and other friends, for the purpose of taking advantage of the reeent charter, by establishing a free school for Catholic education, independent, as well of the university, as of all other state influence. An attempt on the part of the police to interfere arbitrarily with this project, became the subject of a trial before the Chamber of Peers, which Montalembert rendered memorable by his first speech, one of the most brilliant upon record, and a clear foreshadowing, not alone of the eloquence, but of the bold and uncompromising earnestness in the cause of his church and of the common interests of religious liberty, which have constantly characterized his later career. Of the struggle of the Catholic party in France against what they regarded as the arbitrary monopoly of education which was claimed for the university, Montalembert was for many years the leader and champion; and in the various works in the preparation of which he employed all his leisure from public duties, his *Life of St. Elizabeth of Hungary*, his *Life and Times of St. Anselm*, and, above all, in an appeal *On the Duty of Catholics on the Question of Freedom of Education*, which he wrote during a visit to the island of Madeira for the recovery of his health in 1843, he never ceased to advocate the same principles. After the revolution of 1848, Montalembert, true to his former professions, was one of the first of his party to accept of the new state of things, and to use the actual means at his disposal for the furtherance of the views which he had consistently advocated. He was elected member of the national, and afterwards of the legislative assembly; and for a time contrived, while he continued the same line of policy as regards church interests, to give a general support to the government of Louis Napoleon as president of the republic. His first break with that government was on the question of the proposed confiscation of the Orleans property; and after the *coup d' état* of December, the breach became irreconcilable. From that time, Montalembert continued to be the implacable assailant of the arbitrary repression of public opinion which characterized some measures of Napoleon III.; and the brilliant and enthusiastically admiring pictures, which in his *Political Future of England*, he has drawn of its social and political institutions, derive much of their vigor from the covert but palpable contrast with the condition of France which points them all. Besides numerous articles contributed by him to the *Revue des Deux Mondes*, the *Encyclopédie Catholique*, and the *Correspondent*, he also wrote: *L'Avenir politique de l'Angleterre* (1855); *Les Moines d'Occident depuis St. Benoît jusqu' à St. Bernard* (1860—67); English translation, 5 vols. 1861—67); *Une Nation in deuil, la Pologne en* 1861; *L'Eglise libre dans l'Etat libre* (1863); *Le Pape et la Pologne* (1864), etc. He died Mar. 13, 1870. See Memoir by Mrs. Oliphant, 2 vols. (1872).

MONTALEMBERT, Marc René, Marquis de, 1714–1800; b. and educated in Angoulême; entered the army at the age of 18, and while engaged in military service made a specialty of scientific study, and in 1747 became a member of the academy of sciences of Paris. In 1751 he constructed foundries at Rouelle for cannon of larger caliber than previously used, which were employed in the seven years' war (1756–63), in which he was general in the service of Sweden and Russia. He aided Todleben in the capture of Berlin in 1760, and the following year had finished a great work on fortifications, which he was about to publish, when the French minister, Choiseul,

interdicted the publication in order to have it for the sole benefit of France. He became the chief military engineer of France, and his systems proved superior to all others. In 1779 he constructed a fort of wood on the *Isle d'Aix*, which was found to have wonderful resistance in proportion to its cost. At the beginning of the French revolution Mirabeau undertook to make him inspector-general of the fortifications of France, but his rank was a bar-sinister. In 1792 the French war office, under Carnot, purchased his collection of models, and he became the trusted adviser of that minister. He lived to see his inventions and theories, following in general the system of Vauban, adopted in France and throughout Europe, after many years of almost contemptuous opposition. His main work is *Fortification perpendiculaire*, 11 quarto vols., 1776–78; re-edited and published in 1793 under the title of *L'Art défensif superior a l'art à l'offensif*. He was author also of many memoirs on various subjects, of poems, and of comedies.

MONTALVAN, Juan Perez de, 1602–38, b. Madrid. He received instruction and assistance from the famous dramatic writer Lope de Vega, to whom he became greatly attached, and whom he adopted as his model in almost everything. Like his master, he entered the priesthood, and accepted an office in the inquisition. At the age of 30 he had written 36 dramas, and in 1636 the number had increased to 60. The construction was flimsy and the execution careless. One of his last works was an extravagant panegyric, in 1636, on his friend and instructor. His intense and incessant study had now begun to affect his brain, and he soon fell into a state of imbecility, which continued till his death. His collected dramatic works appeared in 1638–39, and were reprinted in 1652.

MONTA'NA, a territory of the United States, formed in 1864, extending from lat. 45° to 49° n., and long. 104° to 116° west. It is mostly to the east of the Rocky mountains, and is bounded, n. by British America, w. by Washington and Idaho, s. by Wyoming, e. by Dakota. Its average length is 470 m., its average breadth 275 m., and its area 143,776 sq.m., or 92,016,640 acres, of which, in 1870, 84,674 were under cultivation. Montana has great mineral wealth, not yet fully taken advantage of, including gold, silver, galena, copper, coal, and precious stones. Its yield of bullion in 1866 was valued at $16,500,000; in 1874, $4,000,000. It is exceedingly well watered, the chief rivers being the Missouri and Yellowstone, with their affluents, and the Columbia. Montana is well adapted for grazing. Pop. '70, 20,595, besides 22,486 tribal Indians.

MONTANA (*ante*), a territory of the United States formed from parts of Idaho and Dakota; pop. '80, 39,157—27,642 of American birth, 3,689 colored, 1737 Chinese, and 1750 Indians and half-breeds. Its surface is rough and mountainous, the main range of the Rocky mountains entering the w. portion from the n., and extending 200 m. s.e. in that section; thence changing their direction and trending toward the w. boundary, where they join the Bitter Root mountains. In the e. portion are the Little Rockies, Little Bear, Bear's Paw, Kay-i-you, Gallatin, the Belt range s. of the great falls of the Missouri, the Highwood in the n., and the low-lying Spoonbill, with many detached spurs and smooth-slooping buttes. This mountainous region constitutes about two-fifths of the surface, extending the entire length of the territory from n. to s., and for 175 m. e. of the w. boundary, the general elevation being much less in the n. than in the s. portion. Between these ranges are deep divides; around the spurs wind beautiful rivers; and picturesque cañons separate the buttes. In the s. portion, in the vicinity of the Yellowstone river, the mountains rise 11,000 ft. above the level of the sea, wearing a crown of perpetual snow, and in the n., beyond the Missouri, the mountain tops in early autumn are clothed in the blue of the sky, mingled with the purity of the snow, visible for many miles over level, treeless plains. Away from the strictly mountainous portion there are solitary peaks of basalt, tuff, and other volcanic rock, of material such that though presenting a rocky appearance, or one of great solidity, much of it can easily be cut with a knife. In the crevasses of the mountains, however, may be found green spots bearing pine, cedar and fir trees, and susceptible of cultivation, while the light-brown grass of the plain below, brown by contrast with the vivid green of the moister soil, furnishes nutritious food for the wandering herds marked with the ranchman's brand. A large proportion of its vast territory is taken up by Indian reservations, 27,797,800 acres being held in reserve for them, of which more than 3,000,000 acres are thought to be tillable land, and only 3,650 acres are under cultivation. Immense prairies and bottom-lands, smooth, rich, and green, await the plowman, untilled and unhabited. The print of the pony's fleet foot is the only mark on the soil, save the traces of a vanished "tepee," or the high stakes supporting the canvas shelf which holds the rattling bones of a dead Indian in his airy sepulcher.

The territory contains the head-waters of the Missouri, the Clarke's fork of the Columbia river, and the Yellowstone, a tributary of the Missouri, giving its name to the celebrated national Yellowstone park, which it irrigates and beautifies. These rivers and their branches permeate the entire territory, furnishing natural highways for the transportation of passengers and freight. Of the branches those of the Missouri are all of more or less interest on account of their association with late Indian troubles. The Big Horn, the Rose Bud, whose valley was the scene of Custer's last battle with the Dakotas under Sitting Bull, the Powder, Tongue, etc., flow into the Yellowstone, and the Marias, Milk, Muscleshell, Big Muddy, Judith, and Poplar rivers flow directly into the

Missouri. The Bitter Root river rises in the w., flowing n., sometimes in the latter portion called the Missoula. The Missouri, rising near Gallatin in the s.w., is formed originally of the Jefferson, Madison, and Gallatin rivers, and flows n.e. to Helena, following thence an e. course to Benton and the Dakota line. It is navigable by steamboats from April to September as far as fort Benton, 303 m. from the boundary line of Dakota, and efforts are being made to improve the bed of the stream as far as the falls between fort Benton and Helena. Government appropriations have been made for the building of dikes to keep the water in the channel, and more are confidently expected, as the traffic on the river is assuming weighty proportions. It is a difficult and tedious work, owing to the scarcity of material. The Yellowstone, rising in Yellowstone lake in n.w. Wyoming, is also navigable early in the season, and even so late as August, as far as the buffalo hunting grounds, 300 m. above its mouth. The Little Missouri crosses the s.e. corner, entering the Missouri in Dakota.

In its geological construction the azoic formations prevail in the w., and eastward first the jurassic appears, next the cretaceous, and near the Dakota line the tertiary. Along the base of the mountains are beds of jurassic and carboniferous rocks. Potsdam sandstone and brick-making clay are abundant, and there is some granite. Slate is found in large quantities in the placer-mining districts. In all sections the strata are much broken, and present formations of almost every geologic age. The plains, which at the mouth of the Yellowstone are 2,010 ft. above the level of the sea, rise gradually to 4,091 ft. at the base of the mountains, the elevation of the valleys varying from 3,000 to 5,000 feet. The cretaceous strata in the n. yield coal of the best quality, which is mined in the vicinity of Bannack, Helena, Virginia, Deer Lodge, and Benton, and there are evidences of its presence on the Missouri, Muselesheil, and Yellowstone. All kinds of petrefactions are found near the Missouri, snails, snakes, sea-serpents, buffaloes' bones, wood, etc.

Its most important mineral wealth is in its vast deposits of gold and silver, which are mined in every method from the modern scientific machinery of quartz-crushing and hydraulic mining, to the homely pan of the original "honest miner," with his little retort and crucible, quicksilver and rough sluice-boxes, vexed and worried by drought and flood. Gold was first discovered on a small creek w. of the main divide of the Rocky mountains, in 1852, contiguous to the site of the present town of Deer Lodge. In 1861 the first mine was opened, and in 1863 the first quartz mill was erected. The principal quartz mines are near Argenta, Bannack, and Helena; Helena, Butte city, and Virginia are the great mining centers. The total yield of the Silver Bow Co. mines in 1883 was over $4,000,000, and from the copper mines of Butte city, in the same county, over 20,000,000 lbs. were produced in 1884. The yield in 1884 was: gold, $54,345,342; silver, $10,071,448. Territorial iron, coal, lignite, and petroleum are found.

In the e. section there is much controversy as to which is the more susceptible to cultivation, the bench or the bottom lands, experiments having been made by the military and other residents along the rivers; but, subject to certain conditions of season and locality, either level has been found to be productive, furnishing excellent wheat land, and fine crops of turnips and the hardier vegetables are raised with very little labor. Groves of cottonwood, resembling the birch trees of the east, ash, and hickory grow on the banks of the Missouri, furnishing fuel for the steamers, being cut by a solitary woodman, and laid ready in long piles. It also supplies a convenient medium of exchange whereby the proprietor of the wood-yard procures his whisky, canned vegetables, and clothing. Thickets of willows are common, in which the tourist searches, frequently with success, for "diamond willow," the favorite wood for walking-sticks. At the Coal Banks, 35 m. from Fort Benton, a new government freight station, there is an elegant park laid out in serpentine paths, and furnished with rustic seats by the industry of the soldiers in leisure hours. Previous to the severe winter of 1881, the bunch, buffalo, and grama grass were sufficient food for stock throughout the year, and it was not considered neeessary to provide shelter, but in that year the snow blocked all the roads for weeks at a time, cutting off all communication between principal points, and the thermometer registered 59° below zero at Fort Benton. Poor cottonwood sold at $15 per cord, and coal was 1 ct. per lb. In ordinary times a military telegraph gives all the facilities for rapid communication as far n. as Fort Benton. The climate is subject to great variations; in a journey of 150 m. a traveler may start in a linen duster and arrive in a fur coat, and a November sun shines with as much intensity as in July. Hay is made on the river bottom lands and carried into the interior, but little is required, except at the forts, and barns are little needed, the hay being stacked on the open prairie. Untoward circumstances have conspired to cause the failure of crops in certain seasons, but in the w. the Prickly Pear, Gallatin, and Bitter Root valleys, and in the n. the valley of the Teton and Sun River valley present a region unsurpassed for agricultural advantages. In the Bitter Root valley, called the Garden Valley of Montana, splendid apples (which sold at Fort Benton in 1880 for 30 cts. per lb.) and plums are raised, $20,000 worth of trees being imported annually from New York nurseries. Potatoes are raised weighing 2½ lbs., 9x10 in. in size. This is a pleasant prospect for the country, the n. and e. depending principally on canned vegetables from the states. The valley lying n. and s. of Fort Owen is 3,284 ft. above the level of the sea, and is 80 m. long, varying from 5 to 10 m. in width. The soil is a rich dark loam. In addition to the main stream, many tributaries flow down from the mountains. Cottonwood and pine trees grow to a height,

the former of 70 ft. and the latter of 150 feet. The Missoula valley is 15 m. wide for 30 m., is well wooded, and has a moderate climate. Prickly Pear valley, from 5 to 15 m. wide and 20 m. long, with beautiful smooth meadows, is in the vicinity of Helena. The valley of the Teton is from 2 to 6 m. wide, with bordering table-lands 75 ft. above the valley level, and is within easy distance of Fort Benton. Deer Lodge valley is 5,000 ft. above the level of the sea, and is 40 m. long and about 12 m. wide, with a central stream flowing through it, and rivulets running down from the mountains on either side. Sun River valley is from 1 to 3 m. wide. The stream is rather swift, and from the "crossing," on the road from Fort Benton to Helena, the valley is about 5 m. wide for 25 miles. The timber is cottonwood and ash. The Judith basin is 50 m. wide and 80 m. long, and is traversed by the Judith river and 3 tributaries, West Fork, South Fork, and Big Spring creek. In the area between these valleys are extensive cattle ranges, taken up by residents of the towns, and visited semi-annually. The bright-winged grasshopper, gay and harmless, is found skipping about on the plains, resembling the little butterflies of the states. Butter is found to be the most lucrative product of the farm; 150 lbs. a week were made in 1880 by the owner of from 40 to 60 cows. It sold at 50 cts. per lb. Prices for the necessaries of life approach nearer to those of the east than they did in Virginia City in 1861, when flour sold for $100 in gold per sack of 100 lbs. The pay of laborers on ranches is $35 a month; in the winter $30. Timber is most abundant in the n.w., particularly along the Flathead and Kootenay rivers.

Aside from the fascination of the gold and silver mines, which draws the prospector thitherward, the natural scenery of the territory attracts the tourist who seeks a new sensation. The Utah Northern railroad is creeping slowly but surely from the Union Pacific into the heart of the mining district, to Dillon and beyond, and millions of dollars' worth of freight lies at the terminus awaiting transportation, while in the season steamboats, some owned by the government and carrying the U. S. mail, others owned by private parties (some of them realizing a profit of $200,000 in 10 years), crowded with freight and passengers, steam up the Missouri from Bismarck, D. T., to Fort Benton, stopping at the Indian agencies of Poplar Creek, the inhabited point nearest the British Possessions, Wolf Point, Fort Berthold, and Fort Buford, in their sinuous course parting company with steamboats which go up the Yellowstone, the point where the rivers divide resembling the separation of the Monongahela and Alleghany rivers at Pittsburg. In ascending the river numerous abandoned forts are passed, and trading-posts and Indian encampments. Under the banks, which rise from 300 to 800 ft. above the level of the river, the boat may tie up for the night. The scenery is extraordinary; it is grand rather than charming. It silences, hushes, commands admiration; it is after awhile monotonous, but never trivial. These towering heights, these frowning parapets and stern dividing walls, are scarcely more enduring than the drifting sand-bars in the river's bed. They crumble and form again by the action of the atmosphere, slowly vanishing monuments of distant ages. Above the Yellowstone the river is narrow but the scenery is more varied, forming itself into castles and mediæval architecture. At Fort Benton coaches take the passengers into the mining region. The months of April, May, June, and July are the best to ascend the river; later the water is so low that much of the latter part of the journey must be by coaches. At any point on the river herds of buffaloes may be seen winding around the buttes or crossing the stream in the steamer's path. In June, 1880, between Fort Peck and Paradise valley, it was estimated that 20,000 were seen in one day; on another day 500,000. Deer and antelope seek the river in the morning. The national park, at the head of the Yellowstone, which is partly in this territory, contains geysers, thermal and mineral springs; hot springs are also found s. of the Main Divide. Flathead lake, 30 m. long and 14 m. wide, lies in the n.w. portion, in the region of the Flathead and Bannack Indians. The Flathead river is its outlet. It has dense forests of heavy timber, pine, tamarack, and fir growing to the edge of the lake, except on the extreme n., which is open grassy prairie, with much tillable land.

Wolves are often met on the prairie; grizzly bears, badgers, mink, otter, and marten are found in the forests, and beavers build their cabins on the river banks. The Indians start on the annual hunt, with all their tribe and appurtenances, about the middle of October, and may be seen traveling for long distances over the plains, fording streams and climbing mountains. They tan the skins of buffaloes and trade them for whisky, sugar, flour, tea, and canned vegetables, and strip up the flesh into jerked meat, or chop it into pemmican for winter subsistence. Whitefish, salmon, and trout are plenty in the streams; bulberries, which resemble red currants, grow by the rivers, and wild strawberries grow near Helena, ripening as late as November.

In the larger towns the manufacturing productions are rapidly increasing; the cost of transporting machinery, making the price of manufactured articles higher than that of the same articles imported from the states, has retarded the growth of industries, but flour, meal, lumber, jewelry, tinware, and bricks are largely manufactured, and malt liquors are made. The steam quartz mills, used principally for gold, and steam sawmills, are a good investment. Bricks and logs are used for building. Freight transportation, trade with the Indians, and that which comes over the Canadian line, are the channels of commercial prosperity. Hardship and peril have accompanied the pioneer in mining, agricultural pursuits, gambling, or legitimate trade, and the transition from

the lawlessness which compelled the organization of the "Vigilantes," who administered justice without fear or favor, into a respect for individual rights, uninfluenced by sectional feeling, is slow and painful, but within a few years the most noted resorts of the border ruffian have become peaceful places of abode, and boards of trade have taken the place of gambling-houses.

There were in 1884, 30 banking institutions, including 13 national banks (4 in Helena), and a large number of private banking-houses. South of the Yellowstone is the reservation of the Crow Indians and the new Crow agency; in the w. are the Flatheads and Bannacks; in the n. and e. are the Blackfeet, Pend Oreilles, Gros Ventres, Assiniboins, Piegans, and Sioux, all of whom are friendly under certain conditions. Education, religious and secular, has as yet made only a beginning, but almost every settlement has a religious society, almost every village a newspaper, and nearly every town 2 or more churches. Missionaries are making great efforts to establish schools at the Indian agencies; they have 1 boarding school and 6 day schools, including that opened by the Congregational denomination in the year 1880 at Poplar Creek. It is said that there are 142 professional scouts among the Montana Indians, but one of the most widely known and constantly employed, Wild Elk, is a Portuguese. Ministers of the Methodist, Roman Catholic, Episcopal, and Congregational order suffer great deprivation and fatigue in order to establish opportunities for religious instruction, and their efforts seem likely to be well rewarded. The Roman Catholics meet with great encouragement among the Indians, with whose language they make themselves acquainted. The professions are well represented, and find ample field.

The territory has over 189 secular schools. In 1882 there were 6,054 youth of school age (4–21) enrolled; expenditures for public schools, $106,687; average monthly pay of teachers, $66.26. Deer Lodge, Virginia, Helena and other cities have graded schools. Helena has a Roman Catholic convent of high reputation as a seminary for young ladies, and a normal course in connection with its high school. There are also a number of private schools in the territory, and many libraries annually receiving large additions. The number of newspapers published in 1880 was 18, 4 of these dailies; whole number, 1884, 33. Value of taxable property, assessed 1883, $44,698,461. Montana has no debt.

The territorial government meets at Helena biennially, and consists of a governor, secretary of state, district attorney, surveyor general, superintendent of Indian affairs, and U. S. commissioner and treasurer, all appointed by the U. S. government. The delegate to congress is elected by the people, has a voice in the deliberations of that body but no vote; the county officers are elected by the people. The legislature consists of 2 branches, a council of 12 members, and a house of representatives of 24 members, all elected by the popular vote. The district judge of the U. S. district court and 2 associate justices are appointed by the president of the United States. Its chief town is Helena; other important towns are Virginia City, Deer Lodge City, Fort Benton (commonly called Benton in recent years, Bozeman, Bannack City, Missoula, Diamond City, and Radersburg. The penitentiary is at Deer Lodge. In 1883 there were 13 counties. Value of live stock, $25,637,000; tons of coal mined, 50,000; products, 1884: corn, 950,000 bush.; wheat, 1,372,000 bush.; oats, 1,740,000 bush.; miles of broadguage r.r., 1884, over 857 (Northern Pacific and branches); narrowguage (Union Pacific), over 200. Pop. of state 1884, 84,000. Capital, Virginia City.

MONTANELLI, GIUSEPPE, 1813–62; b. in Tuscany, and studied law in the university of Pisa, where he afterwards became professor of jurisprudence and commercial law. In the Italian revolution of 1848 he participated, and was for some time an Austrian prisoner. From that time until Tuscany became a part of Italy (1860) Montanelli took a very active share in the tumultuous political movements of the province, though for the greater part of the time compelled to remain outside its boundaries. He organized secret societies, wrote pamphlets and articles for the press, and in every way urged on the cause of Italian unity. He published his memoirs in 1853, wrote a number of lyric poems, and was the author of *Camma* and adapter of an Italian version of Médée, both tragedies being performed with Mme. Ristori in the title roles.

MON'TANISTS. See MONTANUS, *ante.*

MONTA'NUS, a celebated heresiarch of the early Christian church, was a Phrygian by birth, and made his first public appearance about 160 A.D., in the village of Ardabar, on the confines of Phrygia and Mysia. He was brought up in heathenism, but embraced Christianity with all the fanatical enthusiasm for which his countrymen were noted.

Montanus's standpoint was, *in theory*, the exact opposite of that occupied by the Gnostic sects; yet, *in practice*, it led to a similar exclusiveness and sectarianism. He believed in the constancy of supernatural phenomena *within* the church. The miraculous element, particularly the prophetic ecstasy, was not removed; on the contrary, the necessity for it was greater than ever. He considered those only to be true or perfect Christians who possessed the inward prophetic illumnination of the Holy Spirit—they were the true church; and the more highly gifted were to be looked upon as the genuine successors of the apostles, in preference to the mere outwardly consecrated bishops. Thus, they form a religious aristocracy, as arrogant as the Gnostics: the difference between the two simply being that the Montanists prided themselves on a kind of inflamed inspiration, and the Gnostics on a calm and serene illumination of the reason. Neither party wished to recede from the Catholic church, but rather to exist as an esoteric body within its pale. It was persecution, caused, no doubt, by their own insolent

obstinacy, that forced them into a sectarian course. Montanus did not meddle directly with the creed of the church; in fact, he was not a thinker, nor a man of almost any importance intellectually. His efforts were confined to stirring up the Christians generally to fresh religious life—to a belief in a fresh outpouring of the Holy Ghost! At first, Montanus contented himself with predicting fresh persecutions, exhorting men to greater strictness and holiness of life, and announcing judgments to come upon the persecutors; but his idea of his own mission afterwards became more exalted, and he claimed to be in a very special sense a prophet of God—the organ chosen by the Holy Ghost to purify, enlighten, and advance the church. Among the things on which the Montanists laid stress was an ascetic mode of life, scorn of persecution, and love of martyrdom; connected with these, and, indeed, flowing from them, was an aversion to second marriages, and to the restoration of the LAPSED (q.v.). Like other enthusiasts, they also were firm believers in the near approach of the millennium (q.v.) and in the personal advent of Christ. Two "prophetesses," Priscilla and Maximilla, were associated with Montanus in his work. A decree for the expulsion of Montanus and his followers from the communion of the Catholic church was issued by Eleutherus, bishop of Rome. The Montanists at once proceeded to organize themselves as a distinct sect. They found a singularly able apologist in Tertullian (who became a Montanist about 200 A.D.), and continued to exist till the 6th century.

MONTA'NUS, ARIAS. See ARIAS MONTANUS, *ante*.

MONTARGIS, a t. of France, department of Loiret, is situated at the junction of the canals of Orleans and Briare with that of Loing, 40 m. e.n.e. of the city of Orleans. Montargis has some cloth and leather manufactures and considerable trade in corn, cattle, etc. Pop. '81, 11,164. In its vicinity is an extensive forest of the same name.

MONTAUBAN (Lat. *Mons Albanus*), a t. of France, capital of the department of Tarn-et-Garonne, is situated in a rich and beautiful country on a plateau between the rivers Tarn and Tescou, 32 m. n. of Toulouse. It is the seat of a bishop, has a fine cathedral in the Italian style, finished in 1739, built on the site of a still older monastery, the *Mons Aureolus* (Golden Hill), and is a well-built, handsome town. The houses are mostly of brick. Besides having considerable manufactures, it carries on a great trade in wine, grain, leather, etc. Montaubon was founded in 1144 by count Alphonse of Toulouse, became the seat of a bishop in 1317, embraced the reformation in 1572, and suffered severely in the civil wars that ensued. It has acquired historical celebrity as the great stronghold of the Huguenots. Protestantism still exists here, and maintains both an academy and a theological college. Pop. '76, 19,790, nearly one-half of whom were Protestants.

MONTAUK POINT, a promontory at the e. extremity of Long Island, in the state of New York. It is in the township of East Hampton, about 7 m. from Sag Harbor, in Suffolk county, lat. 41° 4′ n., long. 71° 51′ 54″ w. It is a light-house station, with a fixed light (160 ft. above the level of the sea, in a stone light-house), and a fog-horn. It was named for a tribe of Indians which, much reduced in numbers, inhabits the vicinity.

MONTBELIARD (Ger. *Mömpelgard*) a t. of France, in the department of Doubs, 36 m. n.e. of Besançon. It lies in a valley between the Vosges and Jura mountains, is surmounted by an old château, now used as a prison, and carries on manufactures of cotton goods, hosiery, and silks. Clocks, watches, and agricultural implements are also made. Pop. '81, 7,482.

MONT BLANC, the highest mountain in Europe, and, according to the latest measurements, 15,781 ft. above the level of the Mediterranean sea, is one of the Graian Alps, and is situated in the department of Haute-Savoie, France, close to the Italian frontier, and 37 m. s. of the e. end of the lake of Geneva. The vales of Chamouni and Mountjoie lie on the w., and those of Ferret and Allée Blanche on the e. side of it. The waters which spring from its western slopes are drained off to the Arve, and thence to the Rhone, while those which rise on the e. side are feeders of the Dora Baltea, a tributary of the Po. It has 3 snow-clad peaks, and 36 glaciers, of which 16 lie on the n., and 20 on the s. side. The highest summit is a narrow ridge 50 yards by 16, called *La Bosse du Dromedaire,* covered with firm snow, and very steep towards the north. In 1760 Saussure offered a prize for the discovery of a practicable route to the summit of Mont Blanc, which was gained, in June 1786, by Jacques Balmat, a guide. Saussure himself ascended the mountain the following year; and the same feat has since been performed by many, especially since Albert Smith published the well-known pictorial and dramatic description of his ascent in 1851.

MONTBRISON, a t. of France, capital of the department of Loire, 37 m. s.w of Lyons, on the Vizezy, a feeder of the Loire, stands at the base of a lofty and precipitous rock. In the vicinity are mineral springs. Pop. '80, 6,000.

MONTCALM, a co. in s. central Michigan; 720 sq.m.; pop. '80, 33,148—27,500 of American birth. The surface is undulating, and covered with a heavy growth of timber. The pine and the sugar-maple abound. The soil is rich, and produces good crops of Indian corn, wheat, oats, potatoes, and grass. Other staples are wool, butter, and maple sugar. The manufacture of lumber is extensively carried on, and there are many saw-mills. Other manufacturing industries are boots and shoes, flour, sashes and blinds,

and carriages. It is drained by the affluents of the Chippewa, Grand, and Muskegon rivers, and is traversed by the Grand Rapids and Indiana, Detroit, Lansing and Northern, and Saginaw Valley and St. Louis railroads. Co. seat, Stanton.

MONTCALM, a co. in s.w. Quebec, Canada, n. of the St. Lawrence river, watered by the North, Du Lièvre, Rouge, Lac Ouareau, and Gatineau rivers; 4,027 sq.m.; pop. 12,966—11,337 of French, 1,265 of Irish descent. The surface is diversified and the principal productions are grain, cattle, and lumber. Co. seat, St. Julienne.

MONTCALM DE CANDIAC. See CANDIAC, *ante.*

MONTCALM DE SAINT-VÉRAN, LOUIS JOSEPH, Marquis de, b. near Nismes, 1712; entered the army at the age of 14, at 18 was a capt., served in Italy and Germany for many years, and was wounded at the battle of Piacenza in 1746. He became a field officer in 1756, and was sent to Canada in May of that year to make head against the English. He captured fort Ontario at Oswego in August of the same year. The next season he forced the capitulation of fort William Henry at the head of lake George, with an English garrison of 2,500 men, capturing 42 guns and a large amount of stores. In 1758 he defended fort (Carillon) Ticonderoga with 3,600 Canadians, against gen. Abercrombie at the head of 15,000 English, which resulted in a bloody repulse of the latter after an attack of determined vigor. Lack of troops, ammunition, and provisions, and the large re-enforcements of the English, obliged Montcalm to retire all his forces the following year to the defense of Quebec, menaced by a powerful army under gen. Wolfe. The struggle for that stronghold began July 31, 1759, by an attack, which was repelled. The siege was then continued for six weeks without any success on the part of the English, when Wolfe conceived a new plan of operations and succeeded in secretly scaling the cliffs above Quebec with his entire army, and on Sept. 13 appeared on the heights of Abraham in the rear of Quebec. Montcalm promptly prepared for battle in the open field, and at 10 o'clock led the attack in person. His troops, however, were not veterans and the English were. The English assumed the offensive. Wolfe fell dead in the moment of victory, and Montcalm was borne from the field mortally wounded. When told he must die he said: "It is well; I shall not live to see the surrender of Quebec." The city was not surrendered till several days after his death. In 1827 governor Dalhousie, of Canada, caused a monument to be erected in Quebec to the joint honor of the two brave generals who fell on the field where France lost and England won the Canadas.

MONT CENIS. See CENIS.

MONT CENIS TUNNEL. See TUNNEL, *ante.*

MONTCLAIR, a t. in Essex co., n.e. New Jersey, on the New York and Greenwood Lake railroad, and a branch of the Delaware, Lackawanna and Western; pop. '80, 5,146. It is 5 m. n.w. of Newark, and 13 n.w. of Jersey city. It has various manufacturing interests. It lies on the southern and western slope of Orange mountain, with fine view of New York, Brooklyn, and adjacent cities; has much rural beauty, and has attracted a refined and cultivated population.

MONT-DE-MARSAN, a t. of France, capital of the department of Landes, at the junction of two streams—the Midou and Douze—which, when united, take the name of Midouze, and join the Adour. It is 65 m. s. of Bordeaux, with which and with other places it is connected by railway. The town has of late years made great progress. It has a communal college and mineral warm baths. There are manufactures of common woolen cloths, blankets, sail-cloth, and leather. Pop. '80, 8,500.

MONT DE PIÉTÉ, called in Italy MONTE DI PIETÁ, a charitable institution, the object of which is to lend money to the very poor at a moderate rate of interest. It had its origin at the close of the mediæval period, when all such transactions were in the hands of usurers, to whom the necessities of the poor were but an inducement to the most oppressive extortion. The earliest of these charitable banks appears to have been that founded at Padua in 1491, which was so successful as to lead, according to contemporary writers, to the closing of the Jewish banks in that city. The first opened at Rome was under Leo X.; and the Roman monti di pietá are confessed to have been at all times the most successful and the best managed in Italy. The institution extended to Florence, Milan, Naples, and other cities. The principle of all was to advance small sums on the security of pledges, but at a rate of interest barely sufficient to cover the working expenses. Should any surplus remain, it was to be expended for charitable purposes. The mont de piété system was introduced also in Spain, France, Belgium, Germany, and the Netherlands. In 1873 there were in France 46 monts de piété, making yearly loans of 60,000 francs. It formed the model of the loan fund board of Ireland, established by 6 and 7 Vict. c. 91. See PAWNBROKING.

MONT DE PIÉTÉ (*anté*). This institution originated with Francisco di Viterbo, a Minorite friar, in the 15th c., in Padua. He preached publicly against usurers, particularly the Jews, who had the most of that business in Europe; and though opposed even by some of the church orders, notably the Franciscans, he succeeded in inducing the pope to issue a bull in his favor, when opposition died out. The monk's plan was that the rich should combine to assist the poor, by lending them money without interest on pledges or pawns. The idea became popular, and the institution spread to Assisi, Mantua,

Parma, Naples, and Rome; and soon these establishments gained a foothold in Germany, France, and Russia. They were known under different names: "Lombard houses," "mons pietatis," "mons de piété," "banco di rovere," etc. In Rome, Gregory XIII. established a bank of deposit specially for widows and orphans, whose deposits were guaranteed by a lien on the goods of the bank. Sextus V. added to this permission to deposit goods and articles of any value and of every description. Soon this bank reached a height of wealth and power unexampled in the history of such institutions, and was frequently enabled to loan immense sums to states and sovereigns. In Turin the Jews held the money power, and 30 per cent was a common rate of interest among them. In 1519 a mont de piété was established there and the system of extortionate interest was broken up as a result. But this institution was unable to sustain itself, from the fact of charging no interest, and would have failed but that the *compagnie de St. Paul* came to its rescue with the suggestion of a charge of 2 per cent, on which basis it continued business with success. This establishment continued in existence until near the close of the 18th c., when it succumbed to the political convulsions of the period: it was, however, revived in 1822. The mont of Milan was formed by the union of 36 private establishments, and became one of the largest in Italy. It is now nearly 500 years old. In 1833 the capital of this establishment was 671,000 Austrian livres. Among the earliest monts in Italy was one at Cremona for lending corn at interest; it was called the *mons frumenti pietatis.* The custom of charging interest, which has obtained among monts de piété ever since, was licensed in 1515, when the Lateran council in Rome decided that these banks could lawfully charge a sufficient percentage for the use of their money to cover their expenses. At Rome the charge was about 6½ per cent per annum, but this charge has been greatly increased in most of the Italian cities. When Napoleon entered Italy in 1796 he robbed the mons de piété of many valuable treasures. The establishment of monts de piété in France began in the latter part of the 17th c., the first one being at Marseilles in 1695. One appeared in Paris in 1726 in the reign of Louis XIII., but soon failed. In 1769 Turgot tried to re-establish it, but without success; and it was not until the period of Necker's financial administration that it became firmly fixed as a permanent institution. Five years after the establishment of this mont, there were more than 40,000 watches in its vaults. Next to the Paris mont, those of Lyons and Marseilles are rated most important. A mont de piété was established in Copenhagen, Denmark, in 1688, and flourished in private hands until 1753, when it was purchased by the naval hospital for 6,000 rix bank dollars: about $3,000. The rate of interest throughout Scandinavia has been from 9 to 12 per cent. The first monte pio in Spain was opened at Madrid in 1703, and in 1773 an attempt was made to place it in the hands of the government, but without success. The capital of the montes of Valencia, Malaga, and Galicia was at first derived from vacant benefices, termed *espolios y vacantes.* The two Russian monts were established in 1772—"to put an end to the devouring cupidity of the usurers, by offering prompt assistance to those who are so unfortunate as to be suddenly thrown into need." The income over expenses derived from these monts has been devoted to the support of the foundling hospitals, always an object of fostering care on the part of the Russian government. The rate of interest was originally 6 per cent, was afterwards doubled, and finally again reduced, this time to the legal rate. It has always been a Russian custom to deposit plate and other valuables with the mont for safe-keeping; and in 1813, when Napoleon marched on Moscow, the amount loaned by the establishment in that city was more than five times the average sum. In 1817 the St. Petersburg mont lost by a defalcation more than $1,000,000. The mont de piété has never been successfully established in Great Britain; one was opened in the city of Limerick, Ireland, in 1837, and was useful in ameliorating the condition of the poor while it lasted; but it did not become permanent, and the private pawnbroker has always occupied the field in the British Islands. There is no record of any institution of the character of the mont de piété having been established in the United States. The distinction between this institution and the ordinary pawnbroker's shop should always be sharply drawn; the one is a beneficent institution, designed to accommodate the poor in the first instance, and, after payment of expenses, to devote any surplus to the sustenance of some charity or public work; the other is simply a business enterprise, conducted for private profit. See PAWNBROKER, *ante.*

MONTEBELLO CASTEGGIO, a village of northern Italy, in the province of Pavia, 23 m. e.n.e. of Alessandria. It stands in a plain on the banks of the torrent Schizzola. Here the Austrians were defeated by a French army under gen. Lannes, after a desperate conflict, June 9, 1800. The title of duke of Montebello was conferred on the victorious French general five years later. In May, 1859, the Austrians were again defeated here by the united armies of the French and Piedmontese. See CASTEGGIO.

MONTÉ-CASI'NO. See CASINO, MONTE.

MONTÉ-CATINI, a village of Tuscany, situated on a spur of the Apennines, 29 m. w. of Florence, derives its name from the bowl-shaped hill on which it stands. It is of very ancient origin, and was formerly called *Castello.* In the close vicinity of the town are the famous mineral springs of the same name, in high repute for their curative properties, especially in diseases of the liver and digestion. Excellent accommodation can be had by visitors both in private establishments and those under government direction.

MONTECATINI DI VAL DI NIÉVOLE, a t. in Italy, 20 m. e. of Lucca; pop. 6,791. Its mineral springs are much frequented by invalids, and have a high reputation throughout Europe.

MONTÉ-CHI'ARO, a t. of northern Italy, in the province of Brescia, situated on a height on the left bank of the Chiese, in the center of an amphitheater of hills. Pop. 6,933. The chief manufacture is silk. In 1796 the Austrians were defeated here by a French army.

MONTÉ CHRISTO, a small island, belonging to Italy, 26 m. s. of Elba. It consists of a mountain of granite 1983 ft. above the level of the sea, and is uninhabited except by wild goats and other animals. It is inaccessible except by one narrow landing-place. Monté Christo has given name to Dumas's well known novel.

MONTECUCULI, Raimondo, Count, b. near Modena, 1608, and entered the Austrian artillery as a volunteer under his uncle, Ernesto, count Montecuculi, in 1627. During the Thirty Years' war he found many opportunities of distinguishing himself, received rapid promotion, and was employed in various services, military and diplomatic. In 1657 he was sent to support the king of Poland, John Casimir, against the Swedes and Rákóczy, which he did with great effect, compelling Rákóczy to make peace with Poland, and to break his alliance with the Swedes. In the following year he was made a field-marshal, and was sent to aid the Danes against the Swedes, in which also he was eminently successful. In 1660 he commanded the army sent to oppose the Turks, who had broken into Transylvania, and skillfully kept them in check till the arrival of the French, with whose assistance he won the great battle of St. Gotthard, on the banks of the Raab, Aug. 1, 1664—the first decided triumph of European tactics and discipline over the mere numbers and daring of the Ottoman hosts. When the war broke out between France and Holland, in which the emperor took part with Holland, Montecuculi received the command of the imperial army in 1672. He took Bonn, and notwithstanding the endeavors of Turenne to prevent it, effected a junction with the prince of Orange. In 1675 he was opposed to Turenne on the Rhine, and they spent four months in maneuvers in which neither could gain any advantage. After this campaign, Montecuculi spent the remainder of his days at the imperial court and in the society of learned men. He was himself a man of learning and various accomplishments, and has left works on the art of war, on the Turkish war, and on the war of 1664, and also sonnets. The emperor Leopold made him a prince of the empire, and the king of Naples bestowed on him the duchy of Melfi. He lost his life by the fall of a beam as he was entering Linz with the imperial court, Oct. 16. 1681. His writings were published in the original Italian by Ugo Foscolo (2 vols. Milan, 1807); and by J. Grassi (2 vols. Turin, 1821). A semi-autobiographic memoir was translated into Latin, and published at Vienna, under the title of *Commentarii Bellici,* in 1718.

MONTEFIORE, Sir Moses, b. London, 1784; from a wealthy Jewish family of bankers; married, in 1810, a connection of the Rothschilds. In 1829 he visited Palestine, became interested in the Jews in that country, and thereafter devoted himself greatly to their benefit. He also assisted the Jews in Poland; and throughout his life has been earnest in the conduct of plans for the amelioration of the condition of his race. In 1846 he succeeded in influencing the czar Nicholas in their behalf; and in 1863 obtained a firman from the emperor of Morocco which afforded protection to the Jews in his dominions. He endowed a Jewish college at Ramsgate, England, in 1867, in memory of his wife, who had died five years before. He d., greatly esteemed, 1885.

MONTE'GO BAY, a small but flourishing seaport on the n. coast of the island of Jamaica, 17 m. w. of Falmouth. It has a harbor protected by a breakwater, is defended by a battery, and carries on a general trade of some importance. More than 100 vessels annually enter and clear the port. Population variously stated at from 4,000 to 5,000.

MONTE'GUT, Émile, b. at Limoges, 1824, and educated there. He was a student of law when his first step into the literary world was made by an article contributed to the *Révue des Deux Mondes* on the philosophy of Ralph Waldo Emerson. He soon afterwards became one of the editors of the review; his contributions ranging through light literature, foreign *critiques,* and politics, until 1848, when social and political subjects dominated, and were treated with little breadth of view. He soon resumed the study of English and American literature, and afterwards devoted his pen to contemporaneous French writings. From 1862 to 1870 he was associate editor of the *Journal de Paris,* and thereafter again editor of the *Révue des Deux Mondes.* His style is described as clear, trenchant, and of narrow view. He has translated into French Emerson's philosophical essays, with an introduction; Macaulay's history of England, and Shakespeare's works with commentaries and notes; and is author of a considerable number of original works.

MONTELEÓNE DI CALÁB'RIA, a t. in Calabria, 15 m. n.e. of Nicotera; pop. 11,840. It is situated on a high hill, commanded by a castle; the streets are irregular, and the houses mostly of wood. There is a college, and 4 churches, which contain some good paintings. Silk is manufactured to some extent, and there is some trade, but the principal occupation of the inhabitants is tunny-fishing. The t. was founded in the 13th c., and stands near the site of the ancient Vibonium or Hippo.

MONTELÉPRE, a t. in Sicily, 13 m. w. of Palermo. Pop. 5,706. It contains a fine feudal castle, and many rare Phenician and other ancient coins are found near it.

MONTÉLIMAR, an ancient t. of France, in the department of Drome; about 2 m. from the left bank of the Rhone. and 26 m. s. of Valence. It stands on the slope of a hill covered with vineyards. There are factories for silk and cotton goods, tanneries, etc. Pop. '76, 9,512.

MONTEM CUSTOM was a triennial procession of the Eton boys, on Whit-Tuesday, to a certain mound (*ad Montem*) known as the Salt hill, near the Bath road, and which was doubtless so called because certain of the boys levied tribute (for *salt* as the phrase went) from every person present, and even from any chance passer. These juvenile tax-gatherers were attired in fancy dresses of silk. The king and queen, besides many members of the nobility, frequently honored the procession with their presence; and on such occasions, as much as £1000 has been collected, which was given to the senior scholar to support him at Cambridge. The origin of the custom is unknown. It was discontinued in 1847.

MONTENEGRO (an Italian translation of the native name *Czernagora*, "Black Mountain"): a small but independent and recently extended principality situated between Bosnia and Albania. Till 1878 it was separated from the Adriatic by a narrow strip of foreign territory; but the Berlin conference assigned to it the port and district of Antivari, while closing it against the war ships of all nations. Towards the end of 1880, the port and district of Dalcigno (q. v.), previously Albanian, became Montenegrin. The latter place Turkey agreed to cede instead of an inland district indicated by the Berlin conference, but the persistent delay of the Porte to transfer Dalcigno, led to strong pressure and a naval demonstration by the Western Powers. Area of m., about 3,600 sq. miles; pop., 1880, 310,000.

The country, traversed by the Dinaric Alps, is very mountainous, the highest points being Dormitor in the north (7,800 feet), and Kom in the east (7,500). In the e. and s. the hills are partly clad with forests. But the higher ridges and plateaus are bare of vegetation; and being generally covered with loose masses of rock, give to M. an aspect of peculiar sterility and desolation. Yet the valleys are highly fertile; those of the Moratscha and Zeta, with the lowland on the lake of Scutari (into which the chief streams of M. debouch), form the granary of the land. The climate of the hill country, which is M. proper, is ungenial; that of the great valley and its connected region is delightful. The fisheries of the lake are productive. Agriculture is carried on wherever practicable. The capital of M., Cettigne or Cetinji, is a village of 1,400 inhabitants. The chief towns, mostly in the newly acquired territory, are Antivari (7,000), Podgoritza (6,000), Njegos (4,000), Niksi (4,000), Danilograd (2,000), Spuz, Zabliak, Kolasin.

The Montenegrins or Zrnagorzes are Slavs of the Servian stock, and constitute almost the whole population of the country, the exception being some Albanians and others in the new territory. The natives are handsome, athletic, and very hardy. They have many noble characteristics; their morals are pure, and their family affection strong. They are brave and patriotic, but somewhat reckless, passionate, and fierce. Their modes of warfare, formerly savage, have yielded to civilized methods. Their clan system lends itself to the perpetuation of close alliances and bitter feuds, and the hereditary obligation to avenge blood is fully recognized. The constitution of the country is usually called limited monarchy; probably it would be safer to speak of an absolute monarchy in which the council of state and the national assembly have considerable influence on the decisions of the prince. From 1516 to 1851 the head of the government was the Vladika or prince bishop, who besides his proper office as ecclesiastical superior, exercised at the same time those of chief ruler, lawgiver, judge, and military leader. In 1851 the two offices were disjoined, and the Vladika was restricted to his ecclesiastical office, while the cares of government were left to the Gospodar (hospodar) or prince. Since 1879 the state council consists of eight members, of whom half are appointed by the prince. The country is now divided into 80 districts and four military commands. Besides this, there exist the time-honored patriarchal institutions. An elder presides over each village community; these small communities constitute 40 or more tribes or clans, each of which has again an elder at its head; and groups of allied clans choose a knjas. All these various local dignitaries come together to form the Skupschtina or national assembly. The language of the Montenegrins is a very pure dialect of the Servo-Illyrian Slavonic. With the exception of 26,000 Rom. Catholics and some Mohammedans in the new territory, the Montenegrins belong to the Orthodox Greek Church. There are about 2,000 Montenegrins scattered in Austria, Turkey, and Russia; besides small Montenegrin colonies in Alexandria and San Francisco. The public income amounts to about $15,000,000 and exceeds the expenditure. The public debt was paid off by Russia in 1876. The prince's civil list includes $1,750 from home sources, $7,000 from Russia, and $10,000 from Austria. Except the body-guard of the prince there is no standing army. But as all the inhabitants are trained to arms, they form a permanent militia, and are easily transformed into an army of nearly 30,000 excellent soldiers. According to a plan of reorganization contemplated in 1880, there would be a first *ban* of 26,000 men, and a second *ban* or reserve of 8,400. Consult Andric, *Gesch. des Fürstenthumes M.*, 1853; Dutschitsch, *Zrna Gora*, 1874; Gopcevic, *M. et les Montenegrins*, 1877; Denton, *M.*, 1877.

There is little trade in Montenegro, yet hides, wool, venison, dried and smoked fish, mutton, and goat flesh, bacon, lard, etc., are exported in considerable quantities. These goods are carried to Cattaro by the women, aided occasionally by mules, for, owing to the absence of roads (a precaution against invasion), carts are unknown. Austrian and Turkish coins form the currency, as Montenegro has no mint of its own.

History.—Montenegro belonged in the middle ages to the great Servian kingdom, but after the dismemberment of the latter, and its conquest by the Turks at the battle of Kossovo (1389), the Mentenegrins, under their prince, who was of the royal blood of Servia, maintained their independence, though compelled to relinquish the level tracts about Scutari, with their chief fortress of Zabliak, and confine themselves to the mountains (1485). In 1516 their last secular prince resigned his office, and transferred the government to the vladika. The porte continued to assert its claim to Mentenegro, and included it in the pashalic of Scutari; but the country was not conquered till 1714, and on the withdrawal of the Turks soon afterwards, it resumed its independence. In 1710 they had sought and obtained the protection of Russia, the czar agreeing to grant an annual subsidy on condition of their harassing the Turks by inroads, and this compact has, down to the present time, been faithfully observed by both parties. Another part of the agreement was that the archbishop or vladika was to be consecrated by the czar. In 1796 the prince-bishop, Pietro I., defeated the pasha of Scutari, who had invaded Montenegro, with the loss of 30,000 men: and for the next quarter-century we hear no more of Turkish invasions. The Montenegrins rendered important aid to Russia in 1803 against the French in Dalmatia, and took a prominent part in the attack on Ragusa, the capture of Curzola, and other achievements. Pietro II., who ruled from 1830 to 1351, made great efforts to civilize his people, and improve their condition. He established the senate, introduced schools, and endeavored, though unsuccessfully, to put an end to internal feuds, and predatory expeditions into the neighboring provinces. Some Turkish districts having joined Montenegro, the Turks attacked the latter in 1832, but were repulsed. A dispute with Austria regarding the boundary resulted in a war, which was terminated by treaty in 1840. In 1851 the last prince-bishop died, and his successor, Danilo I., separated the religious from the secular supremacy, retaining the latter under the title of gospodar. This step caused the czar Nicholas to withdraw his subsidy (which was renewed, and the arrears paid, by the czar Alexander II.), and the imposition of taxes thus rendered necessary caused great confusion. This was taken advantage of by the Turks, who, under Omar Pasha, invaded the country; but the intervention of the great powers compelled a treaty, Feb. 15, 1853. Danilo went in vain to the Paris conference in 1857, seeking the recognition of Montenegro as independent. In 1860 the Montenegrins excited an insurrection against the Turkish rule in the Herzegovina, which was soon suppressed, and in return they were so hard pressed by the Turks that they were glad to agree to a treaty (1862), by which the sovereignty of the sublime porte over Montenegro was recognized. Fresh complications caused Montenegro to declare war against Turkey in Jan., 1875, but a compromise was effected. Montenegro, however, supported the insurrection against Turkey that broke out in the Herzegovina a little later, and in July, 1876, was again at war. The Montenegrins co-operated with the Russians against their hereditary enemy during the war of 1877–78; and the Berlin conference (1878) recognized the independence of Montenegro, and agreed to an important extension of Montenegrin territory.

MONTENOTTE', a small village of northern Italy, 26 miles w. of Genoa, where the Austrians were defeated by the French on April 12, 1796.

MONTEPULCIA'NO, a city of Italy in the province of Siena, situated on a high hill, s.s.e. of Florence. Pop. about 3,000. Numerous Etruscan remains have been excavated in the neighborhood. The wines of Montepulciano are famous.

MONTEREA'LÉ, a t. of s. Italy, in the province, and 14 m. n.w of the town, of Aquila. Pop. 5,014. It stands on a hill in the midst of a vast plain, and has several elegant churches. There are vast chestnut-groves near Montereale, which furnish the poor inhabitants with the chief article of their subsistence.

MONTEREAU, a t. of France, in the department of Seine-et-Marne, at the confluence of the Seine and Yonne, 46 m. s.e. of Paris, with which there is communication by steamboat. The manufactures are earthenware and leather. Here, in 1419, Jean-sans-Peur, duke of Burgundy, was assassinated, at the instigation and in the presence of the dauphin, afterwards Charles VII.; and in the immediate vicinity Napoleon, Feb. 18, 1814, gained his last victory over the allies. Pop. '76, 6,847.

MONTEREY, a co. in w. California, between the coast range of mountains on the e. and the Pacific ocean on the w., drained by the Salinas, Carmel, and Benito rivers, and crossed by the Southern Pacific railroad; 4,536 sq.m. in 1874; pop. '80, 11,302—8,637 of American birth. The surface is intersected by several mountain ranges, and divided into the three great valleys of the Carmel, Benito, and Salinas. It is sparsely wooded except in the w.; along the coast fruit raising and cattle raising are extensively pursued. The great staples are wheat, barley, and wool. Next in importance are cheese, butter, and peas and beans. San Benito county was set off from the e. part of this county in 1870. Co. seat, Salinas.

MONTEREY′, a village in Monterey co., Cal., 84 m. s.e. of San Francisco, on the Monterey and Salinas Valley railroad. Pop. '80, 1,396. It has a good harbor, and a line of steamers plies between it and San Francisco. It was the capital of the Mexican province of California, and is now the co. seat of Monterey county. It gives name to a Roman Catholic diocese.

MONTEREY′, the most thriving city of northern Mexico, capital of the state of Nuevo Leon, on the San Juan, a tributary of the Rio Grande, 175 m. w. of Matamoras. It is well paved and clean, stands on a broad plain, 1626 ft. above sea level, and is surrounded by beautiful gardens and orchards. Pop. in 1880, 20,000. From its situation its facilities for commerce are great; and it is the entrepôt for the transport of American goods from the Rio Grande to the inland states of Durango and Zacatecas. In the war between the United States and Mexico, Monterey capitulated, Sept. 24, 1846, after a siege of four days, to the American forces under gen. Taylor.

MONTEREY, Battle of, occurred in the beginning of the war between the United States and Mexico, and is so named from the Mexican city before which it took place. General Zachary Taylor, who had occupied Matamoras on May 18, 1846, and had there been re-enforced, marched southward along the main highway into the interior, and sat down before Monterey, the key of the northern provinces of Mexico, on Sept. 9, with about 6,500 men. The city was strongly fortified, and garrisoned by about 10,000 Mexicans under the command of gen. Ampudia. The bishop's palace, standing on an eminence w. of the town, had also been fortified, and the position was esteemed difficult of capture, if not impregnable, to so small a force as was comprised in gen. Taylor's army. The attack was opened on the part of the Americans on Sept. 21, and on the following morning a sharp assault was made on the bishop's palace by general Worth's command. That position being taken, after a stout resistance, the city was forced, and a fierce running fight ensued, the Mexicans resisting stubbornly, as the Americans drove them from square to square, to the center of the city. The battle lasted two days, but on the 24th, gen. Ampudia surrendered the city and garrison. This being the first success of the American arms, and being achieved under peculiar disadvantages of relative position and number of men, greatly encouraged the United States soldiers, and stimulated them to renewed daring, while it was viewed by the American people as auspicious of a successful conclusion to the war.

MONTE RO′SA, the *Mons Sylvius* of the ancients, is the highest mountain in Europe after Mont Blanc. It is situated in the angle where the w. end of the Pennine meets the Lepontic Alps, and separates the canton of Valais from Italy. The northern portion of the mountain is highest, and forms nine peaks, the highest of which is forked and precipitous, and attains an altitude of 15,210 feet above sea level. Many attempts were made to ascend this peak, but none were successful till 1855. The mountain appears to consist of mica-slate, in some places alternating with gneiss. It is rich in metallic ores, and several mines of gold, copper, and iron are worked. The highest mine is between 10,000 and 11,000 feet above sea-level, and in the region of perpetual snow. Rye ripens up to an elevation of 6,000 feet; and the vine is found as far up as 3,200 feet; but there is a difference of nearly 1000 feet in the altitude of the corresponding vegetation on the n. and s. sides.

MON′TE SAN GIOVAN′NI CAMPA′NA, a t. in Italy, in the province of Rome, s.e. of Frosinone; pop. 5,988. It occupies a commanding situation on a hill, and contains many well preserved mediæval edifices. It was once a fief belonging to the house of Aquivas, and the prison of St. Thomas is still pointed out to visitors.

MONTÉ SAN GIULIANO, a t. of the island of Sicily, province of Trapani, situated on a high mountain 4 m. e.n.e. of the town of Trapani. On the mountain (anciently *Eryx*) are the remains of a once famous temple of Venus. Pop. 6,250.

MONTÉ SANT' ANGELO, a city of southern Italy, in the province of Foggia (formerly Capitanata), 28 m. n.e. of Foggia. It stands on one of the Gargano group of hills, at a height of 2,790 ft., and has numerous fine churches. It is famed for its exquisite honey, gathered from the odoriferous alpine plants of the mountain. Pop. 14,936.

MONTÉ SARCHIO, a t. of southern Italy, in the province of Benevento, 13 m. n.w. of Avellino, on the torrent Correo. Pop. 5,600.

MONTESI′NOS, Fernando, about 1600–52; b. Spain; went to Peru while a youth, and eventually became a member of the supreme administrative council at Lima. While employed in this capacity he studied the history and archæology of the country, and wrote *Memories Antiquas Historiales del Peru*, which was translated into French in 1849 by Ternaux-Compans. Prescott, the historian, speaks of him as a writer "who shared largely in the credulity and love of the marvelous which belong to an earlier and less enlightened age."

MONTESPAN, Françoise Athénaïs de Rochechouart de Mortimast, Marquise de, 1641–1707; second daughter of the first duke of Rochechouart. She received a good education at a convent, and appeared in society first under the name of Mlle. de Tonnay-Charente, the name of the château where she was born. Beautiful, witty, and fascinating in conversation, she was soon chosen one of the ladies in waiting of the court of Versailles,

where she became a companion of Mlle. de Vallière, who occupied the same position, and was mistress before her of Louis XIV. She married the Marquis de Montespan in 1663, by whom she had a son. It was the queen who was first so fascinated by the charm of her manner that she called the Marquise to be her companion. In 1668, when her age was 27, the monarch openly recognized both her and Mlle. de Vallière as mistresses, and his queen seemed not the less fond of them. Montespan, who was by far the most powerful and ambitious of the two, maintained for ten years a strange control in state affairs, and retained the joint affections of king and queen; often appearing on state occasions in the carriage with the latter. She was admitted by all to be the most beautiful lady of the court. An abundance of fair blonde hair, expressive blue eyes, dark eyebrows, a complexion of exquisite delicacy, a form full and graceful, and "an air that lighted the spot where she appeared," was the inventory of her personal attractions. Her humors as she acquired power became violent and changeable, and her influence declined. During the ninth year of her *liaison*, Mme. de Maintenon, who was in the service of Montespan as governess of her son, and whose more gentle temper pleased the king, began to supplant her, so that in 1679 the king no longer was under her influence. She retained her place at court till 1691. In 1700 she met the king for the last time at court, and soon afterward followed the fashion of the time and became a religious devotee; but not until she had written a tender letter to her husband, begging him to allow her to return to him, and had been refused. By the king she had two sons, the duc de Maine and the compte de Vexin; three daughters, who lived to marry men of title; and two that died infants.

MONTESQUIEU, Charles de Secondat, Baron de la Brède et de, one of the most celebrated authors and political philosophers of France, b. Jan. 18, 1689, at his father's château of Brède near Bordeaux, and descended from one of the most distinguished families of Guienne. In his youth he was a hard student of jurisprudence, literature, and philosophy. His love of the classical authors was so great that at the age of twenty he composed a work intended to show that they did not deserve eternal damnation for being pagans. In 1714 he was appointed a councilor of the parliament of Bordeaux, and two years after, president of the parliament. His first (published) work was his famous *Lettres Persanes* (Par. 1721), in which, in the character of a Persian, he ridicules, with exquisite humor, and clear, sharp criticism, the religious, political, social, and literary life of his countrymen. Although he did not spare the academy in these *Lettres*, he was admitted a member of it in 1728, and would have been admitted sooner if Cardinal Fleury had not objected on the ground of his jests against religion. In 1726 Montesquieu resigned his office in the parliament of Bordeaux, and spent some years in foreign countries. In England he spent two years, during which he was much in the company of Lord Chesterfield, and was treated with the greatest respect by the most distinguished personages. After his return to Brède, he published his *Considérations sur les Causes de la Grandeur et de la Décadence des Romains* (Par. 1734), a masterly review of Roman history, expressed in a sententious, oracular, and vigorous style. It was followed, after a long interval, by his *Dialogues de Sylla et de Lysimaque* (Par. 1748), published under an assumed name, in which the motives and feelings of a despot are skillfully analyzed. In the same year appeared his great work, on which he had been engaged for twenty years, the *Esprit des Lois* (2 vols., Geneva, 1748), in which it was attempted to exhibit the relation between the laws of different countries and their local and social circumstances. It was immensely popular. No fewer than twenty-two editions were published in eighteen months, and it was translated into various European languages. The *Esprit des Lois* is a wonderfully good book, considering the age in which it appeared. Without adopting Voltaire's hyper-eulogistic criticism, that "when the human race had lost their charters, Montesquieu rediscovered and restored them," it may be said that it was the first work in which the questions of civil liberty were ever treated in an enlightened and systematic manner, and to Montesquieu, more than to any other man, is it owing that the science of politics has become a favorite subject of study with the educated public. Montesquieu died at Paris, Feb. 10, 1755. The collective editions of his works are numerous, amongst which may be mentioned the complete and careful ones by Auger (8 vols., Par. 1819), by Destutt de Tracy and Villemain (8 vols., Par. 1827), by Lefebvre (2 vols., Par. 1839), and by Hachette (2 vols., 1865).

MONTEVID'EO, San Felipe de, the capital of the republic of Uruguay, in South America, is situated on the n. shore of the estuary of the Rio de la Plata (which is here 60 m. wide), and 132 m. e. by s. from Buenos Ayres. It stands on a small peninsula, and is surrounded by a wall and fortifications. The houses are mostly of one story, with flat roofs. The only public buildings worthy of notice are the cathedral and the town-hall. The climate is healthy; but as there are no rivers near the town, water is scarce, and it is only obtainable from wells, or by collecting rain-water in cisterns. The bay or harbor, which is about 3½ m. long by 2 broad, presents excellent facilities for building wharfs, docks, etc., is sheltered from all but the s.w. gales, and averages 16 or 17 ft. in depth. The trade of Montevideo is extensive; the exports consisting of wool, hides, hair, tallow, salt and dried beef, bones, etc.; and the imports, of cotton and woolen fabrics, hardware, also flour, wine, spirits, and other provisions. The chief trade is with Great Britain. Montevideo has steam communication with the United States, Rio Janeiro, Britain, and Genoa, and besides these, carries on a considerable trade with France, Spain,

La Plata, and Italy. The population in 1862 (inclusive of the small suburbs of Cordon and Aguada) was 45,765; and in 1877, 110,167. In 1881, 1,076 vessels, of 739,607 tons, entered and cleared from the port. The imports for 1880 amounted to about £3,323,192 and the exports to about £2,104,593. For the history of Montevideo, see URUGUAY.

MONTEZ, LOLA. See LOLA MONTEZ.

MONTEZUMA, the name of two of the emperors of Mexico.—Montezuma I., the most able of the Mexican emperors, ascended the throne about 1437, and soon after commenced a war with the neighboring monarch of Chalco, which resulted in the annexation of that kingdom to Mexico. Tlatelolco, Cuihixcas, and Tzompahuacan were next annexed. Some reverses which his arms now suffered led to a confederacy of the Tlascalans and two other powerful tribes against him; but in the war which followed Montezuma's arms were again signally triumphant, and the territories of the conquered tribes increased the domain of the now all-powerful Montezuma. After several other successful wars, he died in 1471.—Montezuma II., the last of the Mexican emperors, before its subjugation by the Spaniards, succeeded to the throne in 1502. He had distinguished himself as a warrior during the reign of his predecessor, and after his accession, carried the terror of his arms to the frontiers of Nicaragua and Honduras. He was at the same time a member of the priestly order, and did not demit his functions on his accession. He devoted his chief attention to the improvement of the laws, and of the internal administration, and displayed his taste for pomp and luxury by the magnificence of his household arrangements, and a profuse embellishment of his capital. This necessitated heavy taxation, which, combined with the strictness of his administration, led to continual revolts among his subjects, especially those who had lately come under his sway. When Cortes landed in Mexico with his small army in 1519, Montezuma, blinded by an old prophecy, and by the strange appearance of the invaders, acknowledged them as beings of a superior order, and as his masters (see CORTES). The inhabitants of Mexico having risen against Cortes, the latter caused Montezuma, who was then his prisoner, to appear in order to pacify them; but being wounded accidentally by a stone flung from amongst the crowd of his own subjects, he so keenly felt the indignities which he had suffered, that he repeatedly tore the dressing from his wound, and soon after died, June 30, 1520. Some of his children adopted the Christian religion, and his eldest son received from Charles V. the title of count of Montezuma. One of his descendants was viceroy of Mexico from 1697 to 1701. His last descendant, Don Marsilio de Teruel, count of Montezuma, was banished from Spain by Ferdinand VII., and afterwards from Mexico on account of his liberal opinions, and died at New Orleans in 1836.

MONTFAUÇON, BERNARD DE, 1655–1741; b. Languedoc, of noble family. Educated for a military life, but ill suited to it, he joined the Benedictine order in 1676, studied till 1687, and was then called to Paris, where his profound knowledge of Hebrew and Chaldaic brought him an appointment to study the libraries of France and Italy in the interest of church history. In Italy he found trouble with the Jesuits, and asked his own recall, on the ground that it was useless "to follow up a dogmatic controversy with such great liars as the Jesuits." His numerous works are mostly in Latin.

MONTFERRAT', formerly an independent duchy of Italy, between Piedmont, Milan, and Genoa, now forming part of the kingdom of Italy. It consisted of two separate portions, Casale and Acqui, lying between the maritime Alps and the Po, and having an area of over 1300 sq. miles. The capital was Casale. Montferrat, after the downfall of the Frankish empire, was ruled by its own margraves till the beginning of the 14th century. This illustrious house for a long time disputed the sovereignty of Piedmont with the house of Savoy, and sent to the crusades more heroes than any other sovereign house in Europe. Members of the family ruled simultaneously in Montferrat, Thessaly, and Jerusalem. On the death of the marquis John I., in 1305, his sister, Iolande or Irene, who was empress of Constantinople, succeeded to Montferrat; and her second son became the founder of the family of Montferrat-Palæologus, which became extinct in 1533, and Montferrat passed to the Gonzagas of Mantua. In 1631 the dukes of Savoy obtained possession of a portion of Montferrat, and in 1703, with the consent of the German emperor, the remaining portion passed under their sway, and was incorporated with their own dominions.

MONTFORT, the name of a noble French house, descended, according to the most probable opinion, from Baldwin, count of Flanders, and Judith, daughter of Charles the bald. AMAURI 2d, seigneur de Montfort (a little town between Paris and Chartres) is the first of the family mentioned in history. He lived in the first half of the 11th century. His son, SIMON 1st, had for his third wife Agnes, daughter of Richard comte de Evreux. He left four sons, of whom only AMAURI 4th had issue. The grandson of this Amauri, SIMON 3d, surnamed the *Bald*, comte de Montfort and Evreux, married Amicie, daughter of Robert de Beaumont, earl of Leicester. His second son was the famous SIMON 4th, comte de Montfort, and earl of Leicester, subsequently comte de Toulouse. This nobleman, so conspicuous in the terrible crusade against the Albigenses (q.v.), was born about the year 1150. In 1198 he went to Palestine at the head of a troop of French knights, but failed in doing anything against the Saracens, and was obliged to return. In 1202 he joined the 4th crusade, which, however, had no religious design

at all (see CRUSADES), in consequence of which Montfort abandoned it. In 1209 he took part in the war of extermination against the Albigenses. He signalized himself by his relentless ferocity, and his brilliant successes, but was killed by a stone at the siege of Toulouse, June 25, 1218.

MONTFORT, SIMON DE, Earl of Leicester, the fourth son of the preceding, was b. in France about 1206. The title of earl of Leicester came to him by his grandmother, Amicie de Beaumont, sister and heiress of Robert earl of Leicester, but he did not directly or immediately inherit it; for, during the reign of king John, it was borne by Ranulf, earl of Chester. Some time after the death of Ranulf, Montfort came to England, and offered his services to Henry III. Already he enjoyed a great reputation as a warrior, and Henry was so highly pleased with the young French noble that he conferred on him the title of earl of Leicester. Little did Henry think that the stranger was to prove against himself a great founder and champion of English constitutional liberty. He married Elinor, sister to king Henry III., and the youthful widow of that earl of Pembroke to whom, more than to any other, the people of England owe magna charta. After this marriage—which was viewed with disfavor by the king—de Montfort became a steadfast advocate of the English charter, and of the liberties of the people. After visiting the east, he was sent by the king to undertake the command of Gascony. In 1257 the king's debts were so great and the rapacity of his foreign relations so unbearable, that the people were in a state of insurrection. The barons assembled, and, under the direction of De Montfort, held the celebrated parliament at Oxford. They passed statutes to enforce the provisions of magna charta. The king swore to observe them, but sent forthwith to the pope praying to be absolved from his oath. The bull of absolution arrived. Henry set his barons at defiance, shut himself up in the Tower, and appealed to Louis of France. England was now in arms. The whole middle class looked up to De Montfort as their champion and leader, and the war began with the battle of Northampton. The wars of the barons, under De Montfort, have been superficially viewed but as the strife of turbulent nobles, who, in the absence of foreign warfare, employed themselves in getting up a contest at home. Later researches, however, have shown that but for the struggles of De Montfort and the barons, the concessions at Runnymede would have been a mere worthless parchment. At Lewes the royal forces were signally discomfited and the king taken captive. A French chronicler, who praises De Montfort as "noble, chivalrous, and the ablest man of the age," expressly adds that he was "backed by the general favor of the people," who at this time were so "unspeakably trampled under foot and deprived of all their liberties." The conditions exacted from the king were, that he should observe magna charta and the charter of the Forests; be moderate in his expenses and grants, until his old debts were paid off, and he was enabled to live on his own property, without oppression of merchants or the poor; and that Englishmen only should be chosen counselors. No new pretensions were introduced, even at this moment of triumph, and the constitutional maxim of respecting the person of the king was carefully upheld. The queen (Elinor of Provence), who was in France, now occupied herself in collecting a large army. To deliberate upon the measures to be adopted at this great crisis, writs were issued to the sheriffs, in 1265, by De Montfort, directing them to return two knights for each county, and two citizens or burgesses for every city and borough; and from this time may be clearly dated the recognition of the commons as an estate of the realm in parliament. Guardians had been appointed by the barons to watch over the execution of magna charta, but fifty years of encroachment on the part of the crown convinced De Montfort that a stronger and more enduring security would be to commit the care of constitutional freedom thenceforth to the people themselves, whose interests the barons thus identified with their own. Mr. Blaauw, who, in his *Barons' War*, presents De Montfort almost for the first time in his true character, adds that "it should be an honest pride to us in after-times that English liberty thus owes its birth to the noblest parentage, confidence in the people." A second war broke out, and this time the popular cause was weakened by defection and treachery. Prince Edward (afterwards Edward I.) encountered the barons at Evesham, with a greatly superior army. When defeat was inevitable, the great leader refused to flee. He "fought stoutly like a giant for the liberties of England," but fell, overwhelmed by numbers. The death of De Montfort filled the whole land with mourning. Like Cromwell, whose career in many respects resembles his own, he was denied a grave by the royalists, his head being sent to Wigmore castle, and his mutilated limbs to different towns; but the people bewailed their dead champion, and the clergy pointed to his glorified spirit in heaven. The influence of De Montfort was felt after his death. No baron was executed for bearing arms against his sovereign, and although the Oxford statutes were formally rescinded, their spirit remained. See *Life*, by M. Creighton (1876); and *Simon de Montfort*, by Pauli, translated by Una M. Goodwin (1876).

MONTGOLFIER, JACQUES ETIENNE and JOSEPH MICHAEL, two brothers, distinguished as the inventors of the first kind of balloons (q.v.). They were the sons of a celebrated paper-manufacturer at Annonay, in the department of Ardèche, and early engaged themselves in the same branch of industry. Etienne, after a few successive experiments with the balloon, repaired to Paris; but though his discovery created a great sensation, and was followed out in practice by many eminent men, he obtained little pecuniary aid in

carrying on his experiments, and at length retired to his native town, where he resumed the manufacture of paper and died at Servieres, in 1799.—His elder brother, Joseph, the sharer of his labors and his glory, was a man of much genius and little education; but the two brothers were fitted to supplement each other's deficiencies, and together they made many discoveries, and were both received as members of the French academy. Joseph invented the hydraulic screw, the calorimeter, etc., and in the latter part of his life, filled a post in the department of arts and manufactures. He died at Paris in 1810.

MONTGOMERY, a co. in s.e. Alabama, intersected by the Tallapoosa river, bounded n.w. by the Coosa and Alabama, and drained by many creeks; three railroads pass through it the Western, Mobile and Montgomery, and Montgomery and Eufaula; 900 sq.m.; pop. '80, 52,392—38,948 colored. The surface is rolling or even, and very fertile; Indian corn, cotton, and sweet potatoes are the staples; of cotton the annual product is over 25,000 bales, and it is the largest cotton producing county in the state. The co. seat, Montgomery, is also the capital of the state.

MONTGOMERY, a co. in w. central Arkansas, drained by Ouachita river, Caddo creek, and their many branches; 1140 sq.m.; pop. '80, 5,729—258 colored. The surface is rugged and mountainous; the main ridge is called Crystal mountains, and there are found quantities of rock crystals. The soil is not very fertile; tobacco, wheat, Indian corn, and cotton are the staples. The forests are very extensive; lead and limestone are found in considerable amounts. Co. seat, Montgomery.

MONTGOMERY, a co. in s.e. central Georgia, intersected by the Oconee river, and bounded n.e., s., and s.w. by the Pendleton, Altamaha, and Ocmulgee rivers; 624 sq. m.; pop. '80, 5,381—1871 colored. The surface is level and mostly covered with forests; soil light and sandy; chief products: cotton, wool, sweet potatoes, oats, and Indian corn. Co. seat, Mount Ida, near Montgomery.

MONTGOMERY, a co. in s.w. central Illinois, drained by Shoal creek and its branches; intersected by the Decatur and St. Louis, and Indianapolis and St. Louis railroads; about 700 sq.m.; pop. '80, 28,086—25,438 of American birth. The surface is partly woodland abounding in oak, hickory, etc., and partly prairie; the soil is very fertile and all the cereals are raised in large quantities; bituminous coal is found. Co. seat, Hillsborough.

MONTGOMERY, a co. in w. central Indiana; drained by Sugar creek, a branch of Wabash river, and two or three other creeks; intersected by several railroads having their terminus at Crawfordsville; among which are the Louisville, New Albany and Chicago, and the Indiana, Bloomington and Western; about 500 sq.m.; pop. '80, 27,316—26,537 of American birth. The surface is level or moderately hilly, and is fairly fertile; the staples are wheat, oats, Indian corn, hay, and pork. There is much woodland, the sugar maple abounding. Co. seat, Crawfordsville.

MONTGOMERY, a co. in s.w. Iowa, drained by the sources of the Nodaway and Nishnabatona rivers; intersected by the Burlington and Missouri railroad, and by a branch of the St. Joseph and Council Bluffs; 432 sq.m.; pop. '80, 15,895—13,448 of American birth. Surface rolling and fertile; staples: wheat, Indian corn, hay, and pork. Co. seat, Red Oak.

MONTGOMERY, a co. in s.e. Kansas, drained by the Elk, Fall, and Verdigris rivers; intersected by the Leavenworth, Lawrence and Galveston railroad; 576 sq.m.; pop. '80, 18,217—17,324 of American birth; the number having more than doubled since the census of '70. The surface is mostly prairie, but there is some woodland; wheat, oats, and hay are staples; cattle breeding is extensively carried on. Co. seat, Independence.

MONTGOMERY, a co. in n.e. central Kentucky, drained by branches of Licking river, and intersected by the Lexington and Big Sandy railroad; 185 sq.m.; pop. '80, 10,567—3,566 colored. The surface is broken and hilly, and the soil fairly fertile; wheat, oats, potatoes, hay, butter, and pork are the chief products. Co. seat, Mount Sterling.

MONTGOMERY, a co. in w. Maryland, having the state line of Virginia for its s.w. and s. boundary, the District of Columbia for its s., the Potomac river on the s. and w., and the Patuxent river on the n.e.; 500 sq.m.; pop. '80, 24,759—24,390 of American birth, 9,151 colored. It is drained by Seneca and Rock creeks. It is intersected by the metropolitan branch of the Baltimore and Ohio railroad, and the Chesapeake and Ohio canal is on the s.w. border, following the course of the Potomac. Its surface is hilly; it has forests of pine and hardwood timber, and quarries of stone used for building purposes; other mineral products are gneiss and serpentine. Its soil is fertile along the river banks, producing wheat, rye, corn, oats, potatoes, and dairy products. Live stock is raised to some extent. Co. seat, Rockville.

MONTGOMERY, a co. in n. central Mississippi, drained by the Big Black river, and intersected by the New Orleans, St. Louis and Chicago railroad; about 450 sq.m.; pop. '80, 13,348—6,677 colored. The county was set off from Choctaw and Carroll counties in 1872. The surface is level, and there are large forests, mostly of oak, cypress, and magnolia trees. Cotton is raised in large quantities. Co. seat, Winona.

MONTGOMERY, a co. in e. central Missouri, drained by the Cuivre and Lautre rivers, branches of the Missouri, which bounds it on the s.; intersected by the St. Louis, Kansas City and Northern railroad; about 500 sq.m.; pop. '80, 16,251—15,305 of American birth. The surface is very hilly and for the most part covered by extensive forests. Wheat, corn, oats, and tobacco are raised; limestone, iron, and bituminous coal are found. Co. seat, Danville.

MONTGOMERY, a co. in the eastern part of central New York, on the Erie canal and the New York Central railroad; about 356 sq.m.; pop. '80, 38,315. Most of its land is fertile, producing wheat, Indian corn, and oats. The chief industries are the manufacture of agricultural implements. Co. seat, Fonda.

MONTGOMERY, a co. in s. central North Carolina, drained by the branches of the Yadkin river, which forms its w. boundary, and intersected by the Uharee river and Simmon's Fork; 540 sq.m.; pop. '80, 9,374—9,362 of American birth. The surface is hilly, and mostly covered with pine forests. The bottom land about the creeks is fertile, and produces Indian corn, wheat, oats, and grass. Gold is found, but not in large quantities. Chief town, Troy.

MONTGOMERY, a co. in s.w. Ohio, drained by the Miami river, several of its branches, and Mad river; it is traversed by nine lines of railroad, terminating at Dayton, of which the most important are the Sandusky; Dayton, Hamilton, and Cincinnati; Dayton and Western; Atlantic and Great Western; and Dayton and Xenia; 450 sq.m.; pop. '80, 78,545—66,248 of American birth. The surface is mostly hilly but not rugged, and is covered in part by forests of hard wood; the soil is extremely fertile, producing wheat, Indian corn, oats, hay, and tobacco; of the last, the annual yield is from three and a half to four million pounds. Limestone of several kinds is found, and the Niagara, or bluish variety, is extensively used for building in Cincinnati and elsewhere. The Miami canal extends from Dayton to Cincinnati, and furnishes abundant water power. The principal manufacturing interests are at the county-seat, Dayton (q.v.).

MONTGOMERY, a co. in s.e. Penn., on the Philadelphia and Reading railroad, and the Schuylkill river; 460 sq.m.; pop. '80, 96,494. Its principal products are wheat, rye, and Indian corn; its industries, the manufacture of agricultural implements, carriages, and woolen goods. Co. seat, Norristown.

MONTGOMERY, a co. in n. central Tennessee, adjoining Kentucky; drained by the Red river and the Cumberland, the latter a navigable stream; intersected by the Louisville and Great Southern railroad; about 500 sq.m.; pop. '80, 28,461—13,620 colored. The surface is rolling and hilly, in great part covered by forests of oak, beech, gum, hickory, etc.; the soil is very good, producing in large quantities wheat, oats, corn, sweet potatoes, and tobacco; the annual yield of the last is about 5,000,000 lbs., more than is raised in any other county of the state. Limestone and iron are mined. There are several towns, Clarksville being the county seat.

MONTGOMERY, a co. in s.e. Texas, drained by the San Jacinto river and several creeks, and intersected by the International and Great Northern railroad; 1050 sq.m.; pop. '80, 10,154—5,229 colored. The surface is rolling and generally fertile, though there are some sandy plains; corn, sweet potatoes, and cotton are the chief products. Cattle-raising is carried on extensively. Co. seat, Montgomery.

MONTGOMERY, a co. in s.w. Virginia, drained by the Staunton and New or Kanawha rivers, the last being its w. boundary, and intersected by the Atlantic, Mississippi, and Ohio railroad; 460 sq.m.; pop. '80, 16,693—4,229 colored. The surface is mountainous, the co. being close to the Blue Ridge; there are extensive forests; and in the valleys, wheat, Indian corn, oats, and pork are the staples. Limestone is found. The climate is very healthful and invigorating. Co. seat, Christiansburg.

MONTGOMERY, a city and the capital of Alabama, is on the left bank of the Alabama river, 415 m. above Mobile, at the head of steamboat navigation. The city is very handsomely built, with elegant residences and gardens on a cluster of hills, on one of which is a handsome state-house. It has a law-school, several academies, fourteen churches, five banks, four papers, marble-works, iron-foundries, and is one of the largest cotton-marts in the state. Montgomery is connected with four lines of railway. It became, in 1860, the capital of the confederate states, and continued to be the seat of government until, on the secession of Virginia, it was removed to Richmond. Pop. '70, 10,588.

MONTGOMERY (*ante*), a city in Montgomery co., Ala., the capital of the state, and the co. seat, but inferior in size and population to Mobile; situated on a bluff on the left bank of the Alabama river and about 400 m. by river from Mobile; pop. '80, 16,713—9,931 colored. Montgomery is the terminus of the South and North Alabama railroad and of the Montgomery and Eufaula line, and is also on the Western Alabama railroad. The river is navigable and boats run to and from Mobile at all seasons. The city also does a large business with the surrounding country, which is almost wholly engaged in the raising of cotton, an enormous quantity being sent to Montgomery annually, and all supplies obtained thence. In 1861–62 the place was occupied as a capital by the confederate government; evacuated in 1865 and a great amount of property destroyed, in part by the confederate and in part by the union forces. The city has 3 newspapers issu-

ing daily and weekly editions. 4 banks, and 14 churches; among the public buildings are the state capitol, the co. court-house, a city-hall, masonic temple, etc. Montgomery was founded in 1817, and in 1847 was made the capital in place of Tusealoosa.

MONTGOMERY, GABRIEL, Comte de, a French knight of Scottish extraction, and an officer in the Scottish life-guard of the king of France, was born about 1530. At a tournament given, June 30, 1559, by Henry II. in honor of his daughter's marriage with Philip of Spain, the king insisted upon young Montgomery entering the lists with him. Montgomery reluctantly complied, and the shaft of his broken lance entering the king's visor at the eye, Henry II. was borne insensible from the ground, and so continued for eleven days, when he died. Montgomery, although blameless, left France, and soon after embraced Protestantism in England. On the commencement of the religious wars in 1562, he returned to his native country to support the Protestant cause, and defended Rouen with great bravery. In the third religious war, he was one of the leaders of the Protestants, and gained many advantages over the royalists in Languedoc and Béarn. During the massacre of St. Bartholomew he happened to be at Paris, and owed his escape to the swiftness of his horse, and fled to England. In April, 1573, he appeared off Rochelle with a small fleet, but failed in accomplishing anything, and was obliged to retire. Next year, at the head of a band of Huguenots, he landed in Normandy, and commenced war there; but being compelled at last to surrender the castle of Domfront, he was carried to Paris; and although the gen. to whom he surrendered had assured him of his life, he was beheaded, after long imprisonment, May 27, 1574. Brantome describes him as naturally the most nonchalant and pleasure-loving of men, but that, when once he had mounted his saddle, there was not a more daring or vigilant warrior in all Christendom.

MONTGOMERY, JAMES, a minor British poet, the son of a Moravian preacher, was born at Irvine, Ayrshire, Nov. 4, 1771, and at the age of seven was sent to the Moravian settlement at Fulneck, near Leeds, in order to complete his education for the Moravian pastorate. At Fulneck the course of study seems to have been too severe in its character for the young poet; the imaginative side of his mind was allowed no recognition and it was only by stealth that he read Cowper's poems and *Robinson Crusoe*. Much of his leisure time at school was employed in the composition of verses and of music, in which he took much delight. In 1789 he ran away, and after four years of various employment, became engaged as clerk to Mr. Gales, editor of *The Sheffield Register*, for which he soon began to write political articles. In 1794 he commenced a newspaper of his own, *The Sheffield Iris*, which he continued to edit till 1825, when he retired. During the period of his editorship Montgomery was twice subjected to fine and imprisonment by government. In 1795 he was fined £20, and sentenced to three months' imprisonment, for printing off some copies of a miserable ballad in which government suspected that sedition lurked, and in 1796 he was fined £30, and imprisoned for six months, for giving an account of a Sheffield riot. He received a government pension of £150 in 1835, and he died at his own house in Sheffield, April 30, 1854. His principal works are: *The Wanderer of Switzerland* (1806); *The West Indies* (1809); *The World before the Flood* (1812); and *The Pelican Island, and other Poems* (1827). A collected edition of his minor poems appeared in 1851; and in 1853 his *Original Hymns for Public, Private, and Social Devotion* closed the series of his publications.

His poems are melodious, full of picturesque description, and the gentlest human feeling. The personages introduced in his poems are, however, only shadows, or touched with the faintest color of character. But he claims a well-defined position among the favorite poets of his country by several of his hymns and minor poems, and by his exquisite verses on Home, which commences the third part of *The West Indies*.

MONTGOMERY, JOHN B., 1796–1873, b. N. J.; entered the navy in 1812, and was a midshipman on the *Niagara* in the battle of lake Erie, Sept. 10, 1813. For his gallantry on this occasion congress gave him a sword and a vote of thanks. He was attached to the squadron commanded by Decatur in the war with Algiers, commanded the *Portsmouth* during the Mexican war, in which he seized lower California and blockaded Mazatlan, and was made a capt. in 1853. He commanded the Pacific squadron in 1860, was commodore in 1862, and rear-admiral in 1866. He was last stationed at Sackett's Harbor, N. Y. He was retired in 1869.

MONTGOMERY, RICHARD, 1736–75, b. in Ireland, son of Thomas Montgomery, member of parliament for Lifford: educated at Trinity college, Dublin. In 1754 he obtained a commission in the army, came to America with his regiment three years afterwards, and displayed personal courage and military sagacity at the siege of Louisburg and in other actions. In 1760 gen. Wolfe appointed him adjutant of his own regiment. He took part in the expedition against Havana and Martinique, and shortly after returned to England (1763); resided there for nine years, sold his commission, and again came to America. He settled and married in New York, was a delegate from his county, Dutchess, to the provincial convention of 1775, and soon afterward was commissioned by congress as one of the brig.gens. to command the colonial forces. An invasion of Canada was determined upon and in the same year (1775) Montgomery was made second in command of one of the two divisions sent out under Arnold and Schuyler. The latter was attacked by illness and obliged to return to Albany, leaving Montgomery at the

head of the division. He at once pressed forward and though embarrassed by lack of munitions and food, and by the disaffection of some of his command, had before the end of November captured successively Chambly, St. Johns, and Montreal; thus gaining the mastery over the greater part of the province. In the next month a junction was effected with Arnold before Quebec. The assault of the town was at once resolved upon and on Dec. 31, shortly after midnight, attempted, a snow-fall aiding the concealment of the troops' movements. One division was to direct its attack against the fortifications at the lower end of the town, while the other under Montgomery's command was to scale the cape Diamond bastion. The surprise was complete, the British artillerists retreating after one discharge. Unhappily Montgomery, who was pressing forward at the head of his troops, was instantly killed by this single fire, two of his aids falling with him. The undisciplined colonial troops were overwhelmed at the loss of their leader, and a precipitate retreat ensued. There is little doubt that Quebec would have fallen had it not been for the death of the gallant commander. His conduct and character were eulogized in parliament by Burke, Chatham, and even the bitter tory lord North; congress recognized his services by resolutions of respect and veneration; and by its order a monument was erected in his honor in front of St. Paul's church, New York city, where in 1818 his remains were interred with impressive ceremonies. The "Death of Montgomery" is one of Trumbull's masterpieces.

MONTGOMERY, Robert, a preacher and verse-maker, who has gained notoriety, if not fame, was born at Bath in 1807. He graduated B.A. at Oxford in 1833, M.A. in 1838, and was ordained in 1835. In 1836 he became minister of Percy street Episcopal chapel, London; he afterward removed to Glasgow, where he preached for four years, but returned to London, and resumed office at Percy street chapel in 1843. He died Dec. 3, 1855. Montgomery's works comprise a large number of volumes in prose and verse, on themes more or less sacred. He is best known by his poems. *The Omnipresence of the Deity* (1828) has passed through 26 editions. But his celebrity may be said to have died with him, and his works have already become part of the lumber of libraries. This result has been brought about to some extent by the judgment which Macaulay passed upon *The Omnipresence* and other works by this author.

MONTGOMERY, Sir Robert, LL.D., b. Ireland, 1809; educated at Foyle college, Londonderry, and in 1828 appointed to the service of the East India company. In 1853 he was appointed judicial commissioner, superintendent of prisons, and director-general of police for the province of the Punjaub. For his services in the Indian mutiny, and in quelling the disturbances in the Oude, of which he had been made chief commissioner in 1858, he was thanked by parliament, and knighted. From 1859 to 1865 he was lieut.gov. of the Punjaub. In 1868 he was made a member of the council for India.

MONTGOMERY, William Reading, 1801–71; b. N. J.; graduated at West Point in 1825, and was appointed to the infantry. He served on the western and Canadian border, and through the Florida and Mexican wars. He was brevetted maj. for gallantry at Palo Alto and Resaca de la Palma. At Molino del Rey he led his regiment after the death of its senior officers, and was dangerously wounded. After further service in Texas and the west he resigned from the army in 1855. On the outbreak of the rebellion he raised a regiment of volunteers from his native state. For his gallantry at Bull Run he was made a brig.gen. He was military governor at various times of Alexandria, Annapolis, and Philadelphia; but resigned his commission, from ill-health, in 1864.

MONTGOMERYSHIRE, an inland co. of n. Wales, between Shropshire on the e., and the Welsh cos., Merioneth and Cardigan, on the west. Area, 483,323 statute acres, of which only about 80,000 are under tillage; pop. '81, 65,798. The surface is almost wholly mountainous, a large portion consisting of bleak elevated moorlands; but toward the English border there are several warm, fertile, and well-wooded valleys. The Severn, the Vyrnwy, and the Dovey are the principal rivers. The county belongs almost entirely to the basin of the Severn. The mineral wealth of Montgomeryshire is not great, but copper, lead, and zinc are procured, and millstones, slates, and limestone are quarried. On the uplands the soil is poor, and suited principally for mountain pasture; but in the valleys grain and flax are raised. Cattle and sheep, and the pure breed of Welsh ponies called "merlins," are reared. The Welsh-flannel manufacture is extensively carried on in the county. The capital is Montgomery; pop. '71, 1285, from which the county received its name, and which was so called from Roger de Montgomery, earl of Arundel and Shrewsbury, who in 1093 recaptured the town and castle, which had been wrested during the previous year by the Welsh from the founder, Baldwin, lieut. of the Marches to William the conqueror and William Rufus. The county sends one member to the house of commons. The county business is carried on at Welshpool and Newtown alternately. There is an excellent trade in cattle and horses. Offa's dike traverses the s.e. corner.

MONTH, originally the period of the moon's revolution round the earth. If this is reckoned from the position of the moon among the stars to her return to the same position, the period is called a *sidereal* month, and consists of 27 days, 7 hours, 43 minutes, 11½ seconds; but if from new moon to new moon, it is longer, being 29 days, 12 hours, 44 minutes, 3 seconds; this is called a *synodic* month (see Moon). The latter period forms

one of the three natural measures of the lapse of time, and, notwithstanding that its efficiency depends on the state of the atmosphere, it ranks next to the day in importance. There are several other periods used by astronomers to which this name is applied, as the *tropical* or *periodic* month (27 days, 7 hours, 43 minutes, 4.7 seconds), reckoned from the moon's passing the equinox till her return to the same point; the *nodal* month (27 days, 5 hours, 5 minutes, 29 seconds), from ascending node to ascending node; the *anomalistic* month (27 days, 13 hours, 18 minutes, 37 seconds), from perigee to perigee; and the *solar* month, which is the twelfth part of a solar year, consisting of 30 days, 10 hours, 29 minutes, and 4 seconds. Distinct from all these is the *civil* or *calendar* month, fixed by law for ordinary purposes, and consisting of a fixed number of days—from 28 to 31—according to the particular month. The calendar months, with the number of days belonging to each, are as follow:

	Days.		Days.
1. January	31	7. July	31
2. February	28	8. August	31
" (leap years)	29	9. September	30
3. March	31	10. October	31
4. April	30	11. November	30
5. May	31	12. December	31
6. June	30		

See also the separate months under their own heads. The names by which the months are designated throughout Christendom were given them by the Romans; and though Charlemagne in the 9th c., and the French directory in the end of last century, attempted to substitute descriptive epithets, the old-established names continue to be preferred.

MONTHOLON, Charles Tristan de, *Comte,* afterwards *Marquis de,* descended from an ancient French family, was b. at Paris, 1782. At the age of ten he entered the navy, but exchanged it for the army in 1798. His rise was rapid. He displayed great zeal on behalf of the first consul in the revolution of 18th Brumaire, in the capacity of *chef d'escadron.* He served in a number of campaigns, and was severely wounded at Wagram. Napoleon made him his chamberlain in 1809. He was made a gen. of brigade in 1814, and appointed to the chief command in the department of Loire. On Napoleon's abdication, Montholon remained in France, but held aloof from the Bourbons. No sooner had the emperor escaped from Elba and landed at Frejus, than Montholon hastened to join him. He was present at Waterloo, and accompanied Napoleon to St. Helena, continuing his devoted attentions to him till he breathed his last, and being named in his will as one of his trustees, spared no exertion to carry its provisions into effect. Along with gen. Gourgaud he published *Mémoires pour servir à l'Histoire de France sous Napoléon, écrits à Ste.-Hélène sous sa dictée* (8 vols., Par. 1823). He afterwards published a work entitled *Récito de la Captivité de Ste.-Hélène* (Lond. 1847). In the proclamations which Louis Napoleon issued on his landing at Boulogne in 1840, Montholon was named chief of his staff, and on this account he was condemned by the chamber of peers to 20 years' imprisonment; but he was afterwards pardoned. He died Aug. 21, 1853.

MONTH'S MIND is the name of a Roman Catholic office for the dead, continued through the period of a month, or repeated at the end of that period; the word *mind* being used in the sense of *remembrance,* which it has not infrequently in the common version of the Scriptures and other old English writings.

MONTHYON. See Montyon.

MONTI, Vincenzo, the great regenerator of modern Italian poetry, was b. Feb. 19, 1753, in the Roman province of Ferrara, and studied in the university of Ferrara. On the termination of his studies he repaired to Rome (1778), where the patronage of friends obtained for him the post of secretary to the pope's nephew. During his abode in Rome he became involved in a bitter squabble with Alfieri, whose fame as a master-tragedian of Italy was then high in the ascendant—a fact which may have been unpalatable to Monti in consequence of the failure of his own dramatic attempts. The assassination of Basville, the republican envoy of France, afforded to Monti a subject for his poem, *La Basvilliana.* His two succeeding poems, the *Musogonia* and the *Feroniade,* contained the bitterest invectives against France and Bonaparte; but on the appearance of a French army before Rome, Monti, with the inexcusable inconsistency which characterized his political conduct throughout, hastened to espouse the cause of France, and to invoke the protection of Bonaparte. Monti was shortly after appointed secretary of the Cisalpine directory; and in 1789 repaired to France, where he undertook the translation of Voltaire's poetical works. On returning to Italy he was appointed professor in the university of Pavia; and in 1805, on Bonaparte being proclaimed king of Italy, Monti was appointed state historiographer. On the fall of the empire Monti became the eulogist of the Austrian possessors of his country. In the midst of all these political vicissitudes, he pursued with vigor his studies of the classics, and accomplished one of his greatest works, the translation of the *Iliad* into Italian verse. Monti died at Milan, Oct. 13, 1828, of an apoplectic stroke, and was sincerely lamented, notwithstanding the many opponents his hasty susceptibility had created in life. The best editions of his works are those of Milan (1825–27, 8 vols.), and his *Opere Inedite e Rare* (Milan, 1832–33, 5 vols.). Monti

had a warm admiration of Dante, and partook, in some degree, of the spirit of the great master. His chief works are distinguished by sustained grandeur of imagery and diction, by daring flights of imagination, and by the delicacy, elevation, and fire of the sentiments expressed. They are too numerous for separate notice, but the best of them rank among the noblest productions of Italian genius.

MONTICELLO, the residence and estate of Thomas Jefferson, in Albemarle co., Va., three miles west of Charlottesville. The mansion, now in a dilapidated condition, stands on the top of a high hill overlooking a large extent of the neighboring country; and, at the time of its completion, about 1774, was one of the finest and most picturesque residences in the south, surrounded by beautiful lawns, groves, and gardens. It was Jefferson's home during sixty years; but shortly after his death his heirs were obliged to part with it.

MONTIL'LA, a t. of Spain, in the modern province of Cordova, and 20 m. s.s.e. of the city of that name. It stands on a hillside rising from the south bank of a tributary of the Xenil. Manufactures of coarse linen and earthenware are carried on, and oil-mills are in operation. A famous wine is grown in the vicinity. Montilla is the birthplace of Gonzalo de Cordova, the "great capatain." Pop. 15,000.

MONTJOIE ST. DENIS, the war-cry of the old kings of France, said to be as ancient as the days of Clovis, and from which the king-of-arms, Montjoie, who had exclusive jurisdiction in France, derived his title.

MONTLUÇON, a t. of France, department of Allier, is picturesquely situated on a hill on the right bank of the Cher, 40 m. w.s.w. of Moulins. It has some coarse cloth manufactures, and trade in corn, wine, and fruits. It has also iron-works and plate-glass manufactories. Pop. '76, 21,904. At a distance of 10 m. are the wells of Néris-les-Bains, celebrated in the time of the Romans—of whom many traces are left—and still much frequented by invalids.

MONTMÀGNY, a co. in e. Quebec, having for its n. and n.w. boundary the St. Lawrence river at its widest portion, Goose island lying directly n., and the Grand Trunk railroad traversing the n. section on the s. bank of the river; about 623 sq.m.; pop. '81, 15,268. It is bounded on the s.e. by the state line of Maine, and drained by the n.w. branch of the St. John's river in the s. section, flowing s. along the s. base of a range of mountains, and is drained also by the Riviere du Sud in the north. Its surface is hilly, furnishing good pasturage, and its soil is fertile. Forests of hard wood supply building timber, and it has saw and grist mills. Co. seat, Montmàgny or St. Thomas.

MONTMARTRE. See PARIS.

MONTMÉDY, FORTRESS OF. The t. of Montmédy, in France, is picturesquely located on the river Chiers; pop. about 2,000. It has commerce in grain and wine, and there are manufactures of cheap leathers. It was in the line of the German invasion of France in 1870, and, being a fortified place, was defended with 8 rifled cannon and 65 pieces in battery, and contained a vast supply of munitions of war. It resisted the bombardment of the Germans in September, but succumbed to another attack Dec. 14.

MONTMORENCY, a co. in n.e. Michigan, drained by Black river and Thunder Bay river; 576 sq.m.; population not given in any census returns; unorganized in '80. Its surface consists of table-lands, with a sterile soil. It is extensively covered with forests, and contains beds of iron ore.

MONTMORENCY, a co. in the e. of the province of Quebec, Canada; n.w. of the St. Lawrence; intersected by the St. Anne and Montmorency railroads; 2,183 sq m.; pop. '81, 12,332—11,967 of French descent. Co. seat, Château Richer.

MONTMORENCY, ANNE, first Duc de, Marshal and Constable of France, b. Mar. 1493, belonged to one of the oldest and greatest of the noble families of France. He received, it is said, the name of *Anne* from his godmother, Anne of Brittany. He distinguished himself by his gallantry and military skill in the wars between Francis I. and the emperor Charles V., and was taken prisoner along with his sovereign in the battle of Pavia, which was fought against his advice. He afterwards became the leader of the French government, showing great ability in matters of finance and diplomacy, and was made constable in 1538; but his rough manners made him an object of dislike to many; and the suspicions of the king having been aroused against him, he was suddenly banished from court in 1541, and passed ten years on his estates, till the accession of Henry II., when he came again to the head of affairs. In 1557 he commanded the French army which suffered the terrible defeat of St. Quentin, in which he was taken prisoner. During the minority of Charles IX., Montmorency, with the duke of Guise and the marshal St. André, composed the famous triumvirate which resisted Catharine de' Medici. In 1562 and 1567 he commanded the royal army against the Huguenots, and in both wars gained victories over them, but received a fatal wound at St. Denis, and died at Paris on the following day, Nov. 12, 1567.

MONTMORENCY, HENRI, second Duc de, grandson of the famous constable de Montmorency, b. at Chantilly, April 30, 1595. His godfather was the great *Henri Quatre*, who always called him his "son." When he was 17 years of age Louis XIII. made him admiral, and he defeated the Huguenots in Languedoc, and took the isle of Ré from those

of Rochelle. He afterwards gained other victories over them, and in 1630 received the chief command of the French troops in Piedmont, where he defeated the Spaniards, for which he received a marshal's baton. Unhappily for himself he ventured to oppose Richelieu, who had always been his enemy, and espoused the cause of Gaston, duke of Orleans; for this he was declared guilty of high treason, and marshal Schomberg being sent against him, defeated him at Castelnaudary, and took him prisoner. Montmorency, although almost mortally wounded, was carried to Toulouse, sentenced to death by the parliament, and notwithstanding his expressions of penitence, and the most powerful intercession made for him—for example, by king Charles I. of England, the pope, the Venetian republic, and the duke of Savoy—was beheaded, Oct. 30, 1632. Montmorency was distinguised for his amiability and the courtesy of his manners, as well as for his valor.

MONTMOREN'CY, or MONTMOREN'CI, FALLS OF, on the Montmorency river, near its mouth, about 8 m. from Quebec, Canada. They are 50 ft. wide and 250 ft. high. They are much visited by tourists. A village of the same name is situated near them.

MONTO'RO, a t. of s. Italy, in the province of Avellino, built partly on the slope and partly aronnd the base of a hill, 12 m. n. of Salerno. Pop. 4,721. It forms the central point of several villages, and has large markets and some linen and cloth manufactures.

MONTORO, a pleasant t. of Spain, in the modern province of Cordova, built on a rocky ridge around which winds the Guadalquiver, 26 m. e.n.e. of Cordova. It contains one of the best hospitals in Andalusia. Hardly any drinkable water can be obtained within the town. The heights in the vicinity are clothed with olive plantations, and oil is largely exported from this quarter. Woolens and earthenware are manufactured. Pop. 10,500.

MONTOUR, a co. in e. central Pennsylvania ; 150, sq. m.; pop.'80, 15,468—13,770 of American birth. The surface is uneven, and crossed from e. to w. by hills and ridges of a considerable height ; one of these, Montour ridge, contains limestone and iron ore, which are found also in other parts of the county ; rolled and forged iron is largely exported. The n. branch of the Susquehanna flows through the s., and the rest of the county is watered by Big Roaring, Mahanouring and Chillisquaque creeks. The chief staples are oats, Indian corn, wheat, and potatoes. It is on the Lackawanna and Bloomsberg, and Danville, Hazleton, and Wilkesbarre railroad. Co. seat. Danville.

MONTPE'LIER, the capital of Vermont, is on the Winooski river, 215 m. n.n.w, of Boston. It is a picturesque village, with a handsome state-house, 7 churches, 2 banks, 4 newspapers, iron-foundry, flour-mills, and manufactures of carriages, hats, lumber, etc, Pop. '70, 3,023.

MONTPELIER (*ante*), co. seat of Washington co., Vt.; on the Onion river, 40 m. e.s.e. of Burlington, and 150 m. n.n.w. of Boston; lat. 44° 17′ n., long. 72° 35′ w. It is on the central Vermont, Montpelier and Wells river, and the Montpelier and White river railroads, and built on a plain surrounded by a hilly country. The state-house, erected in 1857, is of granite, and surrounded by a dome 124 ft. high. It also contains a court-house, 7 churches, banks, insurance companies, 4 weekly newspapers, the state library, and the Vermont Methodist seminary and college for women, besides a number of public and private schools. It is a center of trade for the country, and contains machine-shops, tanneries, foundries, and flour and saw mills. Hats, and caps, furniture, and children's carriages are also manufactured. It was made the state capital in 1805. Pop. '80, 3,219.

MONTPELLIER (Lat. *Mons pessulanus* or *puellarum*), a city of France, in the department of Hérault, in 43° 36′ n. lat., and 3° 50′ e. long. Pop. '76, of the town alone, 51,838. Seen from a distance, Montpellier has an imposing appearance, from the number of its towers, steeples, and cupolas; but although its suburbs are clean and well built, the interior of the old town disappoints expectation, being chiefly remarkable for its crooked, dark, narrow, and dirty streets. The public walks, known as those of the Peyrou, and some of the other more elevated points, afford glorious views, embracing the Mediterranean, the Alps, the Cevennes, and the Pyrenees. The most noteworthy buildings are the cathedral, the theater, the exchange, the hall ol justice, the prefecture, the observatory, and the university. The last, which was founded in 1196, is composed of three faculties—that of medicine, founded in the 12th c. by Arabian physicians, and still ranking among the best in Europe—that of the exact, and that of the physical sciences. Montpellier has a botanical garden, the oldest in Europe; a public library of 50,000 volumes, and a pharmaceutical school; admirable museums, natural history and fine art collections, etc. The industrial products of Montpellier are pigments and other chemical preparations, brandy, liqueurs, perfumes, soap, corks, sugar, cotton, woolen, and fine leather goods ; and the trade, which is very important, includes, besides these articles, wine, seeds, olive-oil, and fruits. Railways to Marseilles, Cette, and other ports, besides various canals, facilitate commercial and social intercourse, and few cities of the empire hold out greater attractions in regard to intellectual culture than Montpellier. Its geographical position has led to its being selected as a place of residence for consumptive patients; but the extreme clearness and even sharpness of the air in the more elevated parts of the town, the occasional occurrence of the icy wind known as the

mistral, and the sudden accession of overpowering heats, would seem very materially to counteract some of its long reputed advantages.

MONTPENSIER, Anne Marie Louise d'Orléans, Duchesse de, 1627–93; niece of Louis XIII. of France, known as *grande mademoiselle;* one of the richest princesses of her time, ambitious, and beautiful. Though 11 years older than the dauphin, afterward Louis XIV., she sought to marry him, but failed. Charles II. of England when driven from his throne was a refused suitor for her in marriage. In 1649 she placed herself with Condé at the head of the rebellion of the Fronde, and meeting with some transient success endeavored to make it the basis of claims on the hand of Louis XIV. Condé found in her wealth and resolution his most powerful auxiliary. Jointly they were at one time in possession of Paris, installed in the Hotel de ville, while Louis XIV. was obliged to fight for possession of the capital. While the battle was going on, July 2, 1652, in the faubourg St. Antoine between the troops of Condé and those of the king, the former was saved from defeat by Mlle. Montpensier, who ordered the guns of the Bastille to be turned against the king's troops, and with her own hand fired the first gun. In the excesses against the royalists which followed Condé's success in Paris, Mademoiselle was conspicuous for her humane efforts to put a stop to cruelties. On the re-entry of Louis XIV. into Paris, she retired to her estates for five years and dictated *Mémoires.* In 1657, at the age of 30, she was permitted to return to court, where she soon became ridiculous by falling in love with a young cadet named Lauzun, who was put in the Bastille by Louis XIV. on account of his dangerous blandishments. At the age of 42 Mademoiselle offered her hand and heart to the same youth, the king consenting to the marriage; but the consent was withdrawn before the ceremony could take place; Lauzun was sent away and afterward placed in the Bastile for ten years. It is supposed, however, that they had been secretly married, and that this was the pretext on which the king exercised his authority for their separation. When Mademoiselle was 52 years old the marriage was consummated, but Lauzun was then become a miserable wreck of former beauty, and the match was altogether unhappy. It is said that Lauzun's release from prison was bought by Montpensier by the settling of large estates on bastard sons of Louis XIV. by Mme. de Montespan. The brutality of Lauzun soon necessitated a separation, and she subsequently devoted herself to religious exercises. The *Mémoires* were published in Amsterdam in 1786 in 8 volumes. A Paris edition of these and other works from her pen was published by *Chéruel* in 1858.

MONTPENSIER, Antoine Marie Philippe Louis d'Orléans, Duc de, b. France 1824, fifth son of Louis Philippe. He was educated at the college of Henry IV., and went to Africa in 1844 as lieut. in the artillery, receiving a wound in the Ziban campaign. After a tour in the east he married, in 1846, the infanta Marie Louise de Bourbon, sister of queen Isabella II. The marriage created great excitement, Louis Philippe being generally credited with an intention to seat his son upon the throne of Spain. During the revolution of 1848, the duke resided in England, but soon returned to Spain, taking up his residence at Seville. In 1859, he was appointed capt.gen. of the Spanish army. During the political agitation, before the flight of Isabella, the duke quitted Spain at the request of the ministry, at the same time resigning his position in the army, and the title of infante. Returning to Spain, under the provisional government, he offered himself as a candidate for the throne, but destroyed his chances for election by a duel with his cousin, the infante don Enrique de Bourbon, whom he killed March 12, 1870. He was court-martialed and sentenced to one month's banishment from the capital. His eldest daughter, Marie, was married to the comte de Paris, in 1848; and his third daughter, Maria de las Mercedes, married her cousin, Alfonso XII., in 1878, and died June 26, of the same year.

MONTRAILLÉ, a co. in n.w. Dakota, n.e, of the Missouri river, next to British America. The Rivière des Lacs, and White Earth river flow through it. It has only lately been set off.

MONTREAL, the large and fertile island on which the city of the same name is built, is 30 m. long, 10 m. at its greatest breadth, and contains 197 sq. miles. Formed by the separation of the two channels by which the Ottawa issues into the St. Lawrence, its surface, except at Mount Royal, is only diversified by gentle undulations, which run from n.e. to s.w., and are named *Coteaux.* The island forms a co., divided into two ridings, the east, or *Hochelaga*, and the west, or *Jacques Cartier*, each of which returns a member to the provincial parliament.

MONTREAL, the largest city of Lower Canada and of British America, lies in lat. 45° 31′ n., long, 73° 35′ w., on the left bank of the St. Lawrence, 180 m. above Quebec, and 200 below Lake Ontario, 400 from New York, and 2,750 from Liverpool. Its eastern suburb, which is now an incorporated village, called Hochelaga, was originally the site of an Indian village of the same name, discovered in September, 1535, by Jacques Cartier; and it is from his admiring exclamation at the view obtained from the neighboring hill, that Montreal (corrupted from Mont Royal) derives its name. The westernmost permanent settlement which the French obtained in Canada, it was, under them, merely an outpost of Quebec, and continued to be such, under British rule, till 1832, when it became a separate port. Since then, the rapidity of its progress has been

astonishing. By the deepening of the shallower parts of the river above Quebec, Montreal is now accessible to vessels of over 3,000 tons burden, and drawing from 19 to 22 feet. Its harbor, lined with wharfs for a mile and a quarter, at which 125 ships could lie at one time, is, from its inland position (90 m. above the influence of the tides), perfectly safe. Situated at the head of the ocean-navigation of the St. Lawrence, Montreal has naturally become the dépôt for the exports and imports of all the Canadas. At the same time, the obstruction to vessels sailing further up the river, caused by the rapids, has been surmounted by magnificent canals. The canals connecting Montreal with Lake Ontario have locks of 200 ft. by 45, with 9 ft. of water on the sills; the locks of the Welland Canal are rather smaller. As Montreal lies also near the confluence of the Ottawa and St. Lawrence, it is in immediate connection with the vast lumber-country adjoining the former river and its tributaries; while a canal has been projected to connect the Ottawa, through lake Nipissing, with the Georgian bay in lake Huron, which, if carried out, will probably bring the produce of the north-western states, as well as of Western Canada, through Montreal, as it would give them an outlet to the ocean between 200 and 300 miles shorter than by the Erie canal. But even at present, while navigation is open, an extensive daily traffic is carried on by steamers and sailing-vessels of every description, with lake Ontario and the Ottawa district, as well as with the lower St. Lawrence; and the ships of the Montreal Ocean Steamship Company, by aid of a subsidy from the Canadian government, keep up a weekly communication with Liverpool, while at the same time the harbor is constantly crowded with vessels from other foreign ports. After the navigation of the St. Lawrence is closed, the ocean-steamers find a harbor at Portland, Maine, which is connected with Montreal by a railway of 292 miles. This line belongs to the Grand Trunk Railway Company, and crosses the St. Lawrence at Montreal, by the celebrated tubular Victoria Bridge, the length of which, including its two abutments and 24 piers, is above a mile and three-quarters, By the lines of the same company, Montreal has railway communication with Upper Canada, the western states, and Lower Canada, while the Intercolonial Railway opens up communication with Halifax and St. John. Several other lines afford direct communication with all the important cities and towns in New York state, and the states of New England. The position, therefore, of Montreal as a center of commerce is perhaps unequaled, and its rapid advance in consequence has placed it, within the last few years among the first commercial cities of the American continent—second, perhaps, only to New York. The developments of Manitoba and the Canadian Northwest, and the progress of the Canada Pacific railway, tend to increase its commercial importance. In the three years 1879–81, the total exports varied from $21,000,000 to $31,000,000; and the imports from $27,000,000 to $44,000,000. The harbor is open on an average about eight months, from the latter half of April to the beginning of December. The manufactures of M. are considerable, the principal being saws and axes, steam engines, type, India-rubber shoes, paper, furniture, woolens, cordage, and flour. Pop. (1779) 7,000; (1840) about 27,000; (1871) 107,225; (1881) 140,863.

The public buildings of M. are numerous and handsome. Among them are Bonsecours Market, the Court House, the City Hall, and the Bank of M. It is, however, for the size and magnificence of its churches that M. is most remarkable. The huge Cathedral of St. Peter, still in course of erection, is after the plan of St. Peters' at Rome; it is 300 feet long by 225 wide at the transepts, and is crowned by five domes, one of them to be 250 ft. high.

Though smaller, the church of Notre Dame, the former cathedral, is one of the finest churches on the continent of America. Built in the Gothic style of the 13th c., it comprises seven chapels and nine aisles, and can accommodate between 6,000 and 7,000 people. It has six towers, of which the three on the main front are 220 ft. in height; and its chief window is 64 ft. high, and 32 broad. There are several other Roman Catholic churches belonging to the order of St. Sulpice, to whose members chiefly Montreal owes its foundation, and who still hold the seigniory of the island on which the city is built. Adjoining the cathedral, is the seminary of St. Sulpice, to which a large addition has been built within the last few years at a cost of £8,000. The city contains also some of the largest conventual establishments in the world. The general wealth, indeed, of the Roman Catholic church in Montreal has grown enormous, in consequence of the increased value of the property given to it during the early settlements of the French. The church of England has recently erected, at an expense of above £20,000, a new cathedral, which is very chaste in style, though somewhat small for a metropolitan see. St. Andrew's church, the most important belonging to the church of Scotland, is also a very chaste specimen of Gothic architecture, and cost about £10,000. At about the same cost, the Methodists have built a handsome church in the florid Gothic style. Besides the Roman Catholic college in College street, St. Mary's college of the Jesuits, and a Baptist college, Montreal possesses an important university under the name of M'Gill College. Founded by a bequest of the Hon. James M'Gill in 1811, erected into a university by royal charter in 1821, and reorganized by an amended charter in 1852, it has now, besides its principal, the distinguished naturalist, Dr Dawson, a staff of 29 professors, and has an attendance of upward of 300 students. Montreal is supplied with water by magnificent works, which cost about £120,000. The water is brought from the St. Lawrence, above the Lachine Rapids, by an aqueduct five m. long to a pond, from

which it is forced up by power derived from part of its surplus waters into reservoirs capable of containing 20 millions of gallons, and situated 200 ft. above the level of the river. Along the side of the "Mountain," there is a line of mansions, which command the view that astonished J. Cartier, and which may compare with the suburban mansions of the wealthiest cities in Europe or America. Montreal returns three members to the provincial parliament. Of its total population, 79,000 are French.

MONTREUX, a commune in the canton of Vaud, Switzerland, on lake Geneva, s.e. of Lausanne; pop. '80, 5,000. It contains a number of villages, including Clarens, celebrated in connection with J. J. Rousseau, and Montreux a winter resort for invalids. This commune is said to be one of the most healthful places in the world.

MONTROSE', a royal and parliamentary burgh and seaport on the n.e. coast of Scotland, in the county of Forfar, and situated at the mouth of the river South Esk, about 80 m. n.e. of Edinburgh, and 40 m. s. of Aberdeen. It stands on a level peninsula between the basin of the Esk (an expanse 7 m. in circumference, and dry at low water) and the mouth of the river. A fine suspension-bridge, 432 ft. long and 26 ft. broad—erected in 1828-29 at a cost of nearly £20,000—connects the town with Rossie island, which is again connected with the mainland by a small draw-bridge. The royal lunatic asylum, opened in 1868 at a cost of upwards of £30,000, accommodates about 400 patients. Between the town and the shore are the "links" or downs, among the finest in Scotland for golfing or cricketing. The harbor affords excellent accommodation to vessels of large tonnage, there being 18 ft. of water on the bar at low-water of spring-tides, and is one of the best on the e. coast. Two lighthouses stand in a line on the n. bank of the river, about 400 yards apart; while a magnificent tower, named the Scurdyness lighthouse, erected by the board of trade in 1870 at a cost of nearly £2,700—exhibiting a clear white light, visible at nearly 20 m. distance—stands at the mouth of the river. Flax-spinning is the chief manufacture in the town, there being 4 factories of about 500 horse-power in the aggregate, employing upwards of 2,000 hands, at a weekly cost of about £1500. There is also a large saw-mill, giving employment to nearly 300 men and boys. Ship and boat building, formerly a staple trade of the town, has greatly fallen off. Education is well represented in the town—the chief institution being the academy. In 1875, 1751 vessels, of 108,773 tons, entered and cleared the port. Imports—coal, lime, slate, iron, flax, and manures; exports—manufactured goods, salmon, herring, dressed wood, and agricultural produce. In 1880, the total value of trade was £293,795. Pop. '81, 14,994. Montrose unites with Arbroath, Brechin, Forfar and Bervie to send a member to parliament.

MONTROSE, James Graham, first marquis of, belonged to a family that can be traced back to the year 1128. Its first notable member was sir John Græme of Dundaff, who fell at the battle of Falkirk, July 22, 1298. Early in the 15th c., sir William Graham married for his second wife a daughter of Robert III. Robert, the eldest son of this marriage, was ancestor of the Grahams of Claverhouse. The third lord Graham, created earl of Montrose by James IV., fell at Flodden; his eldest son at Pinkie. The next in succession became viceroy of Scotland after James VI. had ascended the throne of England. His eldest son, John, who succeeded to the earldom in 1616, married lady Margaret Ruthven, eldest daughter of William, first earl of Gowrie, and sister of the unfortunate nobleman who gives name to the *Gowrie Conspiracy*. The issue of this union was five daughters and one son, James, the "great marquis," who was born in 1612, according to tradition, in the town of Montrose. His mother died in 1618, his father in 1626. In the following year, the boy was sent to the university of St. Andrews by his guardian and brother-in-law, Archibald, lord Napier, son of the famous inventor of logarithms. He was an apt, if not an ardent student, and during the two or three sessions of his attendance at college, acquired a very respectable amount of classical knowledge, besides exhibiting a genuine predilection for literature, which the stormy character of his after-life never quite destroyed. In his 17th year, he married Magdalene Carnegie, daughter of lord Carnegie of Kinnaird, on which occasion he had his portrait painted by Jameson, the pupil of Van Dyck. For the next three years he lived quietly at Kinnaird castle, pursuing his studies. On attaining his majority, he left Scotland, to travel on the continent, visited the academies of France and Italy, and perfected himself in all the accomplishments becoming a gentleman and a soldier. On his return, he was introduced to king Charles I., but owing, it is said, to the machinations of the marquis of Hamilton, was coldly received by that monarch, and had no sooner reached Scotland, than he joined the ranks of the king's opponents, which at this period comprehended the majority of Scotchmen. Montrose came back in the very year (1637) when the tumults broke out in Edinburgh on the attempt to introduce the prayer-book. Whether his conduct at this moment was the result of chagrin, or whether he was carried away by the prevailing enthusiasm, or by the persuasions of craftier persons than himself, is difficult to say. Baillie speaks of his having been "brought in" by "the *canniness* of Rothes," a phrase which appears to Mr. Mark Napier to indicate that he was trepanned with difficulty into joining the league. At any rate, the youthful nobleman soon became to appearance one of the most zealous of the covenanting lords. He was one of the four noblemen selected to compose the "table" of the nobility, which, along with the other tables of the gentry, of the burghs, and of the ministers, drew up the

famous national covenant (see COVENANTS), sworn to by all ranks at Edinburgh in the spring of 1638. Montrose was appointed in the following summer to agitate for subscriptions in Aberdeenshire, where the influence of the marquis of Huntly was exercised on the side of the king. He did not, however, meet with great success. In 1639, he made three military expeditions to Aberdeenshire to overawe the royalists. The latter were in considerable force under the marquis of Huntly, but owing to the timid, if not treacherous orders of the marquis of Hamilton, then governor of Scotland, they were always forced to disband. Montrose twice took the city of Aberdeen. On the first occasion (March 29), he compelled the inhabitants to subscribe the covenant, but did no injury to the city. His "too great" humanity is even lamented by Baillie. On the second (May 25), he imposed on the city a fine of 10,000 merks; but though his soldiers pillaged the place, he honorably resisted the importunities of the zealots among the Presbyterian clergy, who wished to expose it to the horrors of conflagration. Baillie again complains of his "too great lenity in sparing the enemy's houses." The arrival at Aberdeen by sea of the earl of Aboyne—Charles's lieutenant of the north—with some re-enforcements, induced Montrose to retreat, who was followed by the earl and the Gordon Highlanders. At Meagra Hill, near Stonehaven, a battle was fought (June 15) between the two armies, in which Montrose obtained a complete victory; four days later, he was again master of Aberdeen, after a fierce struggle at the passage of the Dee. The citizens were stricken with alarm, expecting some bloody punishment for their well-known Episcopalian leanings, but Montrose agreeably disappointed their fears. At a subsequent period, he was upbraided by the committee of estates for not having burned the town on this occasion. News of "the pacification of Berwick" now arrived in Aberdeen, and terminated the struggle in the north. Charles invited several of the covenanting nobles to meet him at Berwick, where he was then holding his court, and to consult with him about Scottish affairs. Among those who went was Montrose, and the Presbyterians dated what they regarded as his apostasy from that interview. Be that as it may, his political position was certainly different after his return. In the general assembly which met, Aug. 13, 1639, under the presidency of the earl of Traquair, as royal commissioner, he showed symptoms of disaffection towards the covenant, and was the object of much popular obloquy. One night he is said to have found affixed upon his chamber-door a paper bearing these words, *Invictus armis, verbis vincitur*. The dissolution of the parliament, in June 1640, led to an open rupture between the king and the covenanters, and both parties prepared to decide their quarrel by force of arms. The former assembled at York an army of 21,000 horse and foot; the latter another of 26,000, which, under the command of Leslie, crossed the Tweed, Aug. 21, 1640. Montrose was the first man that forded the stream. The successes of the Scots, as is well known, soon forced Charles to summon a new parliament for the settlement of the national grievances. Meanwhile Montrose, along with several other influential nobles, had entered into a secret engagement at Cumbernauld, for the purpose of frustrating what they regarded as the factious designs of the extreme covenanting leaders. His conduct in England, too, had been suspicious. It was accidently discovered that he had been secretly communicating with the king; and when the parliament assembled (Nov., 1640), he was cited to appear before a committee. The affair of the *Cumbernauld bond*, discovered by the ingenuity of Argyle, was brought up; but Montrose defended his conduct and that of his colleagues; and nothing came of it, though some fiery spirits among the clergy, says Guthrie, "pressed that their lives might go for it." In the following June, Montrose and some others were accused of plotting against Argyle, and were confined in Edinburgh Castle, where they remained till the beginning of 1642, when they were set at liberty in return for the concessions which Charles had made his Scottish subjects. Although they had been frequently examined, nothing definite had been proved against them. The accusation that Montrose had offered to the king to assassinate Argyle, is not historically substantiated, and is intrinsically improbable. During the next two or three years, he kept aloof, outwardly, from public affairs, but he had finally broken with the covenanters, and had privately ranged himself on the side of the king. The civil war in England had now broken out, and was being carried on with dubious success. Charles and his advisers resolved to crush the Presbyterian leaders in Scotland, who were abetting the efforts of the English parliamentarians. In the spring of 1644 Montrose now raised to the rank of marquis, left Oxford, where he had been residing with his sovereign, and proceeded to Scotland to raise the royalists in the north. The battle of Marston Moor for a moment paralyzed him, but his resolution speedily returned. He threw himself into the highlands, and after skulking about the hills for some time in disguise, met at Blair-Athol some Irish auxiliaries and a body of Highlanders under Allaster Maccoll Keitache Macdonald, better known as *Colkitto*, who had forced their way thither from the Western Isles in hopes of joining him. Montrose instantly placed himself at their head, and the clans quickly rallied round his standard. Marching south, he fell suddenly (Sept. 1) on the covenanting army commanded by lord Elcho, at Tippermuir, near Perth, and gained a complete victory. Not a single royalist was slain. The same night, Montrose entered Perth, where he remained for three days, levying a fine of 9,000 merks on the inhabitants. He then set out for the north, defeated a force of covenanters under lord Burleigh at Aberdeen (Sept. 13), and took possession of the city, which was abandoned for four days to all the horrors of war. The approach of Argyle,

at the head of 4,000 men, compelled Montrose, whose forces were far inferior in numbers and discipline, to retreat. He now plunged into the wilds of Badenoch, recrossed the Grampians, and suddenly appeared in Angus, where he wasted the estates of more than one covenanting nobleman. Having obtained fresh supplies, he once more returned to Aberdeenshire, with the view of raising the Gordons, narrowly escaped defeat at Fyvie in the end of Oct., and again withdrew into the fastnesses of the mountains. Argyle, baffled in all his attempts to capture or crush Montrose, returned to Edinburgh, and threw up his commission.

His opponent, receiving large accessions from the Highland clans, planned a winter campaign, marched south-westward into the country of the Campbells, devastated it frightfully, drove Argyle himself from his castle at Inverary, and then wheeled n., intending to attack Inverness, where the covenanters were posted in strong force under the earl of Seaforth. The "estates" at Edinburgh were greatly alarmed, and raising a fresh army, placed it under the command of gen. Baillie, a natural son of sir William Baillie of Lamington. After consulting with Argyle, it was arranged that he should proceed by way of Perth, and take Montrose in front, while Argyle should rally his vast array of vassals, and attack him in the rear. The royalist leader was in the great glen of Albin—the basin of the Caledonian canal—on his way to Inverness, when he heard that Argyle was following him. He instantly turned on his pursuer, fell upon him unexpectedly at Inverlochy, Feb. 2, 1645, and utterly routed his forces. Fifteen hundred of the Campbells were slain, and only four of Montrose's men. He then resumed his march northwards, but did not venture to assault Inverness—his wild mountaineers being admirably fitted for rapid irregular warfare, but not for the slow work of beleaguerment. Directing his course to the e., he passed—with fire and sword—through Elgin and Banff into Aberdeenshire, which suffered a similar fate. Baillie, and his lieutenant, Hurry, were at Brechin, but Montrose, by a dexterous movement, eluded them, captured and pillaged the city of Dundee (April 3), and escaped safely into the Grampians. On the 4th of May, he attacked and routed Hurry at Auldearn, near Nairn, and after enjoying a short respite with his fierce veterans in Badenoch, again issued from his wilds, and inflicted a still more disastrous defeat on Baillie himself at Alford, in Aberdeenshire (July 2). There was now nothing to prevent his march s., and about the end of the month, he set out with a force of from 5,000 to 6,000 men. He was followed by Baillie, who picked up re-enforcements on his way, and on the 15th of August again risked a battle at Kilsyth, but was defeated with frightful loss—6,000 of the covenanters being slain. The cause of Charles was for the moment triumphant; Montrose was virtually master of the country. The king formally appointed him lieut.gov. of Scotland, and the commander-in-chief of the royal forces. All the principal cities in the w. hastened to proclaim their fidelity, and laid the blame of the recent troubles on the unfortunate Presbyterian clergy. But affairs soon took a very different turn. Great numbers of the Highlanders returned home—we might even say, deserted—burdened with multifarious plunder; and the earl of Aboyne withdrew with all his cavalry. Montrose's position in a district teeming with enemies, was growing critical, and on the 4th of September he broke up his camp at Bothwell, and marched for the eastern counties, where Charles had informed him that the earls of Traquair, Home, and Roxburgh were ready to join him. In this he was disappointed, and on the 13th of the same month he was surprised at Philiphaugh, near Selkirk, by David Leslie, who fell upon the relics of Montrose's army and his raw levies with 6,000 cavalry—the flower of the Scottish forces then serving in England—who had been hurriedly dispatched home on the news of Montrose's startling successes. Leslie completely annihilated his opponent. "On Philiphaugh," says sir W. Scott, "Montrose lost the fruit of six splendid victories." Escaping from the field of battle, he made his way to Athol, and again endeavored, but in vain, to rouse the Highlands; and at last Charles, now beginning to get the worst of it in the civil war, was induced to order him to withdraw from the kingdom. On the 3d of September, 1646, he sailed for Norway, whence he proceeded to Paris. Here he endeavored, but in vain, to induce Henrietta Maria to bestir herself on behalf of her husband. The queen coldly received all his suggestions, and at last Montrose, in despair, betook himself to Germany, in hope of service under the emperor, but soon after returned to Holland, and entered into communication with the prince of Wales, afterwards Charles II. It was here that news of Charles I.'s execution reached him. Montrose fainted on receipt of the dreadful intelligence, and gave way to the most passionate regrets. Charles II. now re-invested him with the dignity of lieut.gov. of Scotland, and Montrose undertook a fresh invasion, on behalf of the exiled monarch. In March, 1650, he arrived at the Orkneys with a small force, and after the lapse of three weeks, proceeded to Caithness; but neither the gentlemen nor the commons would rise at his call. He forced his way as far s. as the borders of Ross-shire, where his dispirited troops were attacked and cut to pieces at a place called Corbiesdale, near the pass of Invercarron, by a powerful body of cavalry under col. Strachan. Montrose fled to the wilds of Assynt, where he was nearly starved to death, when he fell into the hands of M'Leod of Assynt, who delivered him up to gen. Leslie, by whom he was brought to Edinburgh. Condemned to death as a traitor to the covenant, he was executed, May 21, 1650. His demeanor in his last moments was very noble and dignified.

MONTS, Pierre du Guast, Sieur de, 1560–1612; b. in France of an Italian family, became a Protestant, and a favorite of Henry IV., a protégé in the royal household and governor of French provinces. In 1602 the king made him governor of the French company of Canada, which was given exclusive right to trade in furs between 40° and 50° n. lat., the right to make land grants and govern the country, under the name of Acadia, with the title for himself of vice-admiral and lieut.gen. Taking with him Samuel Champlain, Poutrincourt, Biencourt, and Pontgravé as chief officers, he sailed from Havre, March 7, 1604. He made Poutrincourt governor of Port Royal, explored the bay of Fundy, made Tadoussac in the St. Lawrence his fur trade depot, and returned to France. There he found his monopoly had excited such lively opposition that his privileges had been withdrawn. But he succeeded in recovering a part on more specific conditions and returned to Canada, where Champlain, one of his officers, founded the city of Quebec in 1608, and his fur trade became profitable. After Henry IV. was assassinated Monts's privileges were taken away, to his financial ruin. Charlevoix mentions Monts as a thoroughly honest man, of capacity and straightforwardness, fitted to succeed in any enterprise of a commercial character. He died in Paris.

MONTSERRAT, one of the lesser Antilles, belonging to Britain, lies 43 m. n.w. of Guadeloupe, and at a similar distance from Antigua and St. Kitts. It is about 11 m. in length, 7 in breadth, and contains an area of 47 Eng. sq. miles. The population in 1871 was 8,693, the females exceeding the males by 737. About two-thirds of the surface is mountainous and barren, the rest is well cultivated. The chief products are sugar, limes, rum, and molasses; but cotton, arrow-root, and tamarinds are also exported. The island forms a portion of the government of the Leeward isles, and is directly ruled by a president, aided by a council and house of assembly. The chief town is Plymouth, on the s. coast. The revenue of Montserrat in 1874 amounted to £4,648, and the expenditure to £5,038. In 1873 the tonnage of vessels which entered and cleared its port was 13,213; and the total values of imports and exports in 1874 were respectively £23,938 and £33,079.

MONTSERRAT (Lat. *Mons Serratus*, so named from having jagged ridges *like the teeth of a saw*), a mountain of Catalonia, in the n.e. of Spain, about 30 m. from Barcelona. Its height is 3,919 feet. "Its outline," says Ford (*Handbook for Spain*, vol. i. p. 419), "is most fantastic, consisting of cones, pyramids, buttresses, nine-pins, sugar-loaves, which are here jumbled by nature in a sportive mood." The pious Catalonians aver that it was thus riven and shattered at the crucifixion. Every rift and gorge is filled with box-trees, ivy, and other evergreens. From the topmost height the eye wanders over all Catalonia, and from the sea the ridge looks like an immense wall with seven pyramidal peaks. The mountain, however, owes its celebrity not to its extraordinary appearance, but to the Benedictine abbey built upon it, at an elevation of 1200 feet, and to the 13 hermitages formerly perched like eagles' nests on almost inaccessible pinnacles. In 1811 the French, under Suchet, plundered the abbey, burned the library, shot the hermits, and hung the monks (who had given shelter to their emigrant brethren at the revolution). The place suffered still more in 1827, when it became the stronghold of the Carlist insurrection.

MONTYON, or MONTHYON, Antoine Jean Baptiste Robert Angel, Baron de, (sometimes erroneously named Monthyon), 1733–1820; b. in Paris. Left in the possession of considerable wealth while young, he soon became distinguished by his noble use of it. An advocate at 23, member of the council of state at 27, at the head of the government of Auvergne at 33, Montyon in every place exhibited benevolence and philanthropy in connection with administrative ability. He dedicated 20,000 livres annually to the help of poor workmen. After serving successively as intendant of Provence and La Rochelle he was called to Paris to be made councilor of state in 1775. Author as well as statesman and philanthropist, he sent to the académie Français in 1777 an *Éloge de Michel de l'Hospital;* in 1778 published *Recherches et Considerations sur la Population de la France.* Often he relieved the wants of writers in distress, who rarely knew the source of their benefactions. In 1780 he founded a large number of prizes in the various societies of France, to be awarded through their officers to meritorious improvements or work in the arts, for the most useful literary works, for the best means of avoiding the unhealthy effects of certain mechanical operations upon the workmen, for the best treatises on mechanical processes, for the noblest acts performed by the poor, and for the most useful medicine. For each of these prizes or sets of prizes he set apart 12,000 livres of which the income should form the annual awards. At the beginning of the revolution, fearing the storm that menaced the rich and noble, he emigrated to Geneva, whence he sent an essay to the French academy, entitled, *Consequences qui ont Résulté pour l'Europe de la Découverte de l'Amerique*, for which he received the prize of 3,000 francs, and presented it to the academy to be used for another prize. He took no part while in Geneva, or afterwards while residing in England, with the intrigues of the royalists. In 1798 he published in London a valuable work entitled *Rapport sur les Principes de la Monarchie Française*, intended as a refutation of a work by Calonne in which that minister asserted that France never had had a legal constitution. Montyon made a masterly showing that while France had not lacked for legal constitutions her kings had always power and will to violate them at pleasure. He remained an exile from his country throughout the directory and the empire of Napoleon I., not so much by his attachment to the old monarchy

as his repugnance to the military horrors of imperialism. He returned to Paris in 1814, and after 1815 re-established such of his prizes and beneficences as had been stopped by the revolution and the empire, and not only put them on a new footing but richly endowed new charitable institutions in Paris; and on his death in Paris distributed permanent bequests to a large number of the most beneficent institutions of France. Among his published works of permanent value are: *Quelle Influence ont les diverse Espèces d'Impôts sur la Moralité, l'Activité, et l'Industrie des Peuple;* and, *Particularités et Observations sur les Ministres de Finances les plus Célèbres depuis* 1660 *jusqu' en* 1791, a remarkably interesting compendium of facts, philosophy, and anecdotes.

MONUMENT (Lat. *monumentum*, from *moneo*, to remind), anything durable made or erected to perpetuate the memory of persons or events. The chief kinds of monuments are described under their special names. See CAIRN; CROMLECH; SEPULCHRAL MOUNDS; PILLAR; OBELISK; PYRAMID; ARCH, TRIUMPHAL; BRASSES; TOMB; STUPA; MAUSOLEUM, etc.

MONUMENTAL THEOLOGY designates the scientific study of theological opinion and feeling as unconsciously expressed in works of art. While, in written language, thought is presented by the discursive faculty in elements which are gradually apprehended, a work of art, as a completed object existing in space, may produce at once its grand impression on the mind. But as the Christian church took its rise in the midst of Judaism and of heathen worship, and as its first members had been trained under the influence of one or both of these conflicting systems, Christian monuments as well as early church doctrine and practice often present a mixed character. In the progress of the church it was also frequently attacked by errors within and hostile influences without, the effect of which would be exhibited in its works of art. A complete consideration of monumental theology, would, therefore, require careful attention to these modifying agencies as they show themselves in works of art. The principles of Christianity, from its origin to the present day, have influenced human art as well as thought and life. While this influence has sometimes been disastrously exerted, it has generally been in some degree beneficial. After the revival of classical learning and the infusion of new elements into modern life, art was indeed partly liberated from that subjection to the church which in the middle ages had been complete. Yet it must always find its noblest inspiration in Christian themes. Consequently its monuments may be expected to exhibit much of the Christian thought and feeling of each successive age. Hence recent writers on theological encyclopædia continue the study of Christian monuments to the present time. Piper, the chief advocate of this method of collateral theological study, presents the following classification of its themes: I. Of the essential nature of Christian art—1. Of the art faculty. 2. The artist. 3. Works of art. II. History of Christian art and art-works—1. Chronology and geography of art. 2. The various species of art. 3. Art monuments. III. Christian art ideas—1. In architecture. 2. In the graphic arts. For theological purposes this last is the principal division, and to illustrate it the others are chiefly preliminary. Architecture furnishes to this department much less than painting and sculpture. Biblical subjects are found represented in works of art through all periods of church history. The *Biblia Pauperum*, Bible of the poor, for example, consisted of 40 or 50 pictures giving the events of the life of Christ and some of the Old Testament times; each picture had a Latin text or sentence. A larger work with the text in rhyme was called the *Mirror of Salvation.* Before the reformation these were the chief text-books in use, especially by the monks in their preaching, and were practically all the Bible which the laity and even many of the clergy knew. The pictures were copied in sculptures, in paintings on walls and on glass, and in altar-pieces. And after the invention of printing the *Biblia Pauperum* was perhaps the first book printed in Germany and Holland, first with wooden blocks and then with types. While monumental theology is an interesting and to some extent useful collateral study, its claim to an independent scientific treatment is denied by many eminent authors, and must be regarded, at best, undetermined.

MONZA (anc. *Modœtia*), chief t. of a district in the province of Milan, stands on the river Lambro, 10 m. n.n.e. of Milan, with which it is connected by railway. Pop. '81, 17,077. It is essentially a town of Lombard growth, and under the Lombard sovereigns was capital of their kingdom. It owes much of its early importance, and its chief public edifices, to Theodolinda, the great queen of the Lombard dynasty. In the middle ages, Monza was conspicuous for the wealth of its numerous citizens and nobles, and the extent of its cloth-trade. It has undergone 32 sieges. The cathedral, founded in the 6th c. by Theodolinda, contains many interesting memorials of this great queen. The famous iron crown (q.v.) and regalia of Lombardy, employed at the coronation of the German emperors as kings of Italy, were removed from Lombardy by the Austrians in 1859, on the cession of that province to France. The town has a good gymnasium, a theater, two hospitals, and a philharmonic institution. Its present manufactures of cottons, hats, and preserved meats are daily increasing. Monza is surrounded by an exuberantly fertile district, which yields abundance of grain, fruits, wine, and silk, and possesses great beauty of scenery and climate.

MOODY, a co. in s.e. Dakota, bounded by Missouri, drained by the Big Sioux river and its branches; about 500 sq.m.; pop. '80, 3,915—926 foreign, a very large increase

within the last few years. The surface is a rolling prairie and quite fertile, wheat being the chief product. Co. seat, Flandreau.

*MOODY, Dwight Lyman, b. Mass., 1837. He worked on a farm until the age of 17, and then became a clerk in a boot and shoe store in Boston. He joined a Congregational church, and in 1856 he went to Chicago, where he engaged in mission work among the poor. He established a Sunday school, which in a year numbered 1000 scholars. During the war of the rebellion he was in the service of the Christian commission, and subsequently a city missionary employed by the Young Men's Christian association of Chicago. A church was built for him, and though unordained, he was chosen its pastor. In the Chicago fire of 1871, the church, mission house, and furniture were destroyed. A new church was erected large enough to accommodate 2,500 persons. In 1873 he visited Europe with Ira D. Sankey, the singer, holding large and successful meetings in Edinburgh, Glasgow, Dublin, London, and other important places. Returning home in 1875, Mr. M. held large and interesting meetings in New York and many other large cities. He makes no claim to scholarship or rhetorical graces; but is a close student of the Bible, a most earnest, faithful, and simple preacher, and is recognized as charitable and judicious. Vast crowds have attended his services in England and this country, and many converts have been gathered. See *Supp.*, page 883.

MOODY, James, 1746–1809; b. N. J.; a farmer who commanded a force of tories during the revolutionary war. He was taken prisoner, but escaped from West Point, where he was confined, and went to England. There, in 1783, he published an account of his loyalist campaigns, under the title of *Lieut. James Moody's Narrative of his Exertions and Sufferings in the Cause of Government since* 1776. After the war he removed to Nova Scotia. His *Narrative* was reprinted at New York in 1865.

MOODY, Joshua, 1633–97; b. England; in childhood came to Newbury, Mass.; graduated at Harvard college in 1653; began to preach in 1658; became pastor of the church in Portsmouth, N. H., in 1671. He became involved in quarrels with the government of the colony, and was imprisoned, but released on condition of his leaving the colony. In 1684 he was settled in Boston as the assistant minister of the First church; was appointed president of Harvard college, but declined the appointment. During the witchcraft trials in 1692 he opposed the unjust and violent measures against the accused, and aided some to escape from prison. His zeal occasioned his dismissal from the church, and he left the ministry. He published *A Practical Discourse Concerning the Choice Benefit of Communion with God in his House, witnessed unto by the Experience of Saints as the best Improvement of Time, being the sum of Several Sermons on Psalm lxxxiv.* 10, *preached at Boston on Lecture Days; A Sermon on the Sin of Formality in God's Worship, preached on the Weekly Lecture in Boston.*

MOODY, Samuel, 1676–1747; b. Mass.; graduated at Harvard college in 1697, was minister at York, Me.; was chaplain to sir William Pepperell's expedition against cape Breton. He was an eccentric but very useful man; some of his odd expressions are still in circulation, showing much shrewdness and a quick wit. He refused a regular salary, depending on the voluntary contributions of the people. He published *The Doleful State of the Damned; Judas hung up in Chains; Election Sermon; Life and Death of Joseph Quasson, an Indian.*

MOODY, Zenas Ferry. See page 883.

MOO'ERS, Benjamin, 1758–1838; b. Mass.; was an ensign in the revolutionary army, and afterward lieut. and adj. He served through the war, at the close of which he settled in Plattsburg, N. Y. He was for a number of years a member of the legislature of that state, besides holding various local offices, and he was a maj.gen. of militia, and commanded at the battle of Plattsburg, Sept. 11, 1814. The *Order Book*, kept by him when adj., was published in 1876.

MOOLTAN. See Multân, *ante.*

MOON, The, the satellite of the earth, revolving round the earth from w. to e. in a period of one *month* (q.v.), and in consequence accompanying the earth in its motion round the sun. As the moon, to an observer on the earth, advances more than 13° to the e. daily, whilst the corresponding advance of the sun is barely 1°, her progress among the stars is much more notable than that of the latter. This rapid angular motion, the continual and regular variation of her illuminated surface, and her large apparent size (being nearly equal to that of the sun), have rendered the moon an object of general interest; while her importance as the principal nocturnal substitute for the sun, and her special value to navigators and geographers, in the determination of longitudes (see Latitude and Longitude), have rendered the *lunar theory* the object of the most thorough and careful investigation.

Phases of the Moon.—The first peculiarity about the moon that strikes a casual observer is the constant and regular change of her illuminated surface from a thin crescent to a circle, and *vice versâ*, and a corresponding change in the time of her appearance above the horizon. These changes depend upon the position of the moon relative to the earth and the sun, for it is only the half of the moon facing the sun that is illuminated by his rays, and the whole of this illuminated portion can only be seen from the earth when the sun, earth, and moon are in a straight line (the *line of syzygies*), and the earth is between the sun and moon. When the moon is in the line of syzygies, but

between the earth and the sun, no part of her illuminated disk can be seen from the earth. In the former case, the moon is said to be *full*, and in the latter, *new*. A few hours after "new moon," the moon appears a little to the *east* of the sun as a thin crescent, with the horns pointing toward the *east*, and as she increases her angular distance from the sun at the rate of about 12° daily, the crescent of light becomes broader, till, after the lapse of a little more than seven days, at which time she is 90° in advance of the sun, she presents the appearance of a semicircle of light. The moon is then said to have completed her *first quarter*. Continuing her course, she becomes "gibbous" (q.v.); and at the 15th or 16th day from new moon, attains a position 180° in advance of the sun, and now presents the appearance known as *full moon*. From this point she begins to approach the sun, again appearing gibbous, and after a third period of more than seven days, reaches a point 90° w. of him, and enters her *last quarter*. Here, again, she appears as a semicircle of light, the illuminated portion being that which was not illuminated at the end of the first quarter. The moon now rapidly approaching the sun, resumes the crescent form, but this time with the horns pointing *westward*, the crescent becoming thinner and thinner, till the moon reaches the position of new moon, and disappears. From "full moon" to "new moon," the moon is said to be *waning;* and from "new moon" to "full moon," *waxing*. The earth as seen from the moon presents similar phases, and has, consequently, at the time of new moon, the appearance of a round illuminated disk, and at full moon is invisible. This explains the peculiar phenomenon occasionally observed when the moon is near the sun (either before or after new moon), of the part of the moon's face which is unilluminated by the sun appearing faintly visible, owing to the reflection upon it of strong earth-light. This phenomenon is designated by the Scottish peasantry as "the new mune wi' the auld mune in her airms." At new moon, the moon of course comes above the horizon about the same time as the sun, and sets with him, but rises each day about 50 minutes later than on the day previous, and at the end of the first quarter, rises at midday, and sets at midnight, continuing to lag behind the sun. When at the full, she rises about sunset, and sets about sunrise, and at the commencement of her last quarter, she rises at midnight, and sets at midday.

Distance and Magnitude.—From repeated observations of the moon's horizontal *parallax* (q.v.), and of the occultations by her of the fixed stars, her mean distance* from the earth has been estimated at 237,600 m., and as her angular diameter averages 31′ 26″, her actual diameter is 2,153 m., or a little less than $\frac{3}{11}$ths of the earth's diameter. Her volume is therefore about $\frac{1}{49}$th of that of the earth, and her density being only .577 (that of the earth being taken as unity), her mass is only $\frac{1}{88}$th of the earth's mass; consequently, the force of gravity at her surface is so much less than it is at the surface of the earth, that a body which weighs 1000 lbs. here, would at the moon weigh only 163 lbs.

Orbit.—The moon revolves round the earth in an elliptic orbit, with the earth in the focus; the eccentricity of the ellipse being equal to .05491 of half its major axis, or more than $3\frac{1}{4}$ times that of the earth's orbit. The plane of her orbit does not coincide with the ecliptic, but is inclined to it at an angle of 5° 8′ 47.9″, and intersects it in two opposite points, which are called the *nodes* (q.v.). The point at which the moon is nearest to the earth is called her *perigee*, and that at which she is furthest from it her *apogee*, and the line joining these two points is called the *line of apsides*. Were the moon's orbit a true ellipse, which, owing to various irregularities known as *perturbations*, it is not, the *lunar theory* would be exceedingly simple; but these perturbations, which, in the case of the planets, produce a sensible variation in their orbit only after many revolutions, cause, in the case of the moon, a distinct and well-marked deviation from her previous course in a single revolution. The retrogradation of her nodes along the ecliptic causes a continual change in the plane of her orbit, so that if, during one revolution round the earth, she occults certain stars, at the next revolution she will pass to one side of them, and will remove further and further from them in each successive revolution. A little consideration will show that by this continual change of her orbit, the moon will, in course of time, pass over or occult every star situated within 5° 24′ 30″ of the ecliptic. The motion of the nodes is so rapid that they perform a complete circuit of the orbit in 6793.39 mean solar days, or 18.6 years. Another important change in the moon's orbit is the revolution of the line of apsides, by which the perigee and apogee are continually changing their position relative to the earth and sun. This revolution is more than twice as rapid as that of the nodes, being performed in 3232.57 mean solar days, or 8.85 solar years. As this motion is common to all the heavenly bodies, its nature and origin will be treated of under the head of perturbations (q.v.). Its effect upon the moon is to produce a variation in her distance from the earth, independent of that produced by her elliptic motion.

Eclipses.—As the moon in her course passes the sun at the commencement of every (synodic) month, and by the middle of the month has placed the earth between herself and the sun, it is evident that if she moved in the plane of the ecliptic, there would be either a *total* or an *annular eclipse of the sun* at the commencement, and a *total eclipse of the moon* in the middle of every month. The inclination of her orbit allowing her to pass the

* When the moon is at the *perigee*, she is within 225,000 m., and when at the *apogee*, more than 251,000 m. from the earth; her angular diameter as measured from the earth consequently varies from 28′ 45″ to 33′ 30″ and for a particular day is greatest when she is on the meridian, as in this case she is nearer to the spectator, by about 4,000 m., than when she is on the horizon.

sun 5° 9′ to the n. or s. of his track, prevents such a frequent occurrence of eclipses. If the moon, when in conjunction, is at either of her nodal points, and at the same time near her perigee, a total eclipse of the sun takes place; but if near her apogee, the eclipse is only annular, for at that time her apparent diameter is less than the sun's. If also, at her conjunction, her latitude n. or s. is less than the sum of her semi-diameter and of that of the sun, a *partial* eclipse takes place, and is greater the nearer the moon is to her node. These partial eclipses are seldom seen from all parts of the earth's illuminated surface, but are confined to a portion of it, which is greater or less according to the extent of the eclipse. Lunar eclipses, which occur when the moon is in opposition (i.e., at full moon), are seen equally from all parts of the earth's surface which are turned towards her. The conical shadow of the earth which is projected into space on the side opposite to the sun, is in length equal to about $3\frac{3}{5}$ times the moon's mean distance, and a section of it at the moon's distance is 1° 23′ in diameter. If, then, the moon, which is never more than $33\frac{1}{2}'$ in diameter, happens to be at or near her node, a *total* eclipse will take place, and in no case can it be *annular*, as is sometimes the case with those of the sun. Even during total eclipses, the moon is seldom quite invisible, but generally shines with a faint copper-colored light. See Eclipses.

Rotation.—The moon, like all other satellites, as far as at present known, revolves round her own axis in precisely the same time that she revolves round the earth; she thus presents always the same face to us, and consequently, though her comparative proximity has enabled us to become better acquainted with her surface than with that of any other heavenly body, our knowledge is confined to one half of her surface, with the slight exception of the knowledge obtained from her *libration* (q.v.). To the inhabitants of the side of the moon next the earth—if the moon had inhabitants, which is very improbable—the latter would appear as a luminary about 2° in diameter, immovably fixed in their sky, or at least changing its position only to the extent due to the moon's libration. The earth would thus seem to them to have a disk about 15 times larger than that of the sun.

Physical Features.—The surface of the moon, as seen from the earth, presents a most irregular grouping of light and shade. The dark portions were named by the earlier astronomers as seas, lakes, etc., and still retain these names, although there is strong evidence against the supposition that the moon, or at least that portion of it presented to us, contains any water. The brighter parts of the moon are mountainous, as is proved by the fact of their casting shadows when the sun's rays fall upon them obliquely, and also by the ragged appearance presented by the interior illuminated border of the moon, an appearance which can only be satisfactorily accounted for on the supposition that the surface of the moon is not level, in which case the higher portions will be illuminated some time before the light reaches the level parts; and it is observed that as the illumination proceeds, bright spots start up in advance of it, and when the moon is on the wane, these same spots continue to shine for some time after the surrounding surface is immersed in gloom. The mountains occur either singly, when they are generally of a circular form, and are called *craters*, or in groups, which are mostly annular, and form a sort of wall inclosing a deep depression or plain, in which are situated one or more conical mountains. The craters are not unfrequently 8 or 10 m. in diameter, and some of the walled plains measure more than 100 m. across. The principal mountain range is the Apennines, which crosses the surface from n.e. to s.w., and attains, according to some authorities, an altitude of about 20,000 ft., though sir John Herschel gives about 2 m. as the probable limit of elevation above the moon's surface. The heights are estimated from a micrometric measurement of the length of their shadows, a method not, in this case, susceptible of much accuracy. The moon everywhere presents traces of volcanic agency, but no active volcanoes have yet been discovered, nor is there any sign of recent volcanic action. Seen through the telescope, she presents a bleak, desolate appearance, without indications of animal or vegetable existence. She appears to be devoid of an atmosphere, or, if one exists, it must be of exceeding rarity.

The influence of the moon in causing *tides* (q.v.) has long been well known, and there is some reason for supposing that she produces a similar effect on the atmosphere, combining with other causes in the generation of winds. Those winds which prevail about the time of new and full moon, and at the vernal and autumnal equinoxes, are particularly ascribed to her influence. On the supposition that the moon might also affect organic nature, experiments were instituted by Mead, Hoffmann, and others; but no certain results were attained. The periodicity which has often been noticed in certain diseases, especially in insanity (hence called *lunacy*), was long supposed to have some connection with lunar influence, and this opinion is held to some extent at the present day. The chemical effects of the moon's rays are, so far as is at present known, feeble, though in particular instances they exhibit an *actinism* as powerful as that of the sun. Decomposition of animal matter takes place more rapidly in moonshine than in darkness, and the moon's rays, when concentrated, have a sensible effect on the thermometer.

The best map of the moon is the large and accurate one of MM. Baer and Mädler, which presents a most minutely detailed picture of her visible surface; the map is 3 ft. in diameter. See for further information the articles Perturbations; Libration; Nodes; Evection; Metonic Cycle; Tables, Lunar, etc.

Superstitions regarding the Moon.—The moon was anciently an object of worship, and even in the 17th c. she was supposed, by the common people of England, to exercise great influence over human affairs. The times for killing animals for food, gathering herbs, cutting down wood for fuel, sowing seeds of various kinds, were all regulated by the "age" of the moon, and these set periods were considered to be a necessary part of practical knowledge, and ignorance or neglect of them to be infallibly productive of loss. There were similarly defined periods for taking particular medicines, and attempting the cure of particular diseases. Many such superstitions prevailed until a recent period in the Highlands of Scotland, favorable or unfavorable consequences from any occurrence being predicted according to the age of the moon at the time it happened. Throughout Scotland, the waning moon was considered to have an evil influence, and full or new moon to be the most auspicious season for commencing any enterprise. The same opinion was held in Scandinavia and Germany, and the history of all nations teems with similar superstitions. See the article ECLIPSES.

In the Edda, we read that "Mundilföri had two children—a son, Mâni (moon), and a daughter, Sôl (sun);" and in German, the moon is masculine and the sun feminine to this day. It was the same in Ang.-Sax.; although modern English has in this matter followed the classic mythology, in which Phœbus and Sol are gods; and Selene, Luna, and Diana are goddesses; Grimm (*Deutsche Mythologie*, p. 666) quotes an old invocation to the "New Moon, gracious lord" (Neuer Mon, holder herr), for increase of wealth; and down to recent times the German people were fond of speaking of "frau sonne," and "herr mond" ("lady sun," and "lord moon"). The same inversion (as it appears to us) of gender is found among the Lithuanians and Arabians, and even the ancient Mexican meztle (moon) was masculine. Among the Slaves, according to Grimm, the moon is mas., a star fem., and the sun neut. In Hindu mythology also, the moon—Chandra or Soma—is a male deity, represented by one myth as the son of the patriarch Atri, who procreated him from his eyes, but by another as arising from the milk-sea when it was churned by the gods for the attainment of the beverage of immortality. His wives are the 27 daughters of the patriarch Daksha, known as the nymphs of the lunar constellations. By one of them, Rohinî, he had a son Budha (not to be confounded with Buddha), the regent of the planet Mercury, who begot on Ilâ, a son, Purûravas, who became the ancestor of a royal family, hence called the lunar dynasty.—The moon is generally represented as wearing white garments, with a mace in one hand, and riding in a chariot drawn by ten horses or antelopes. The animal sacred to him is the hare (the Hindus believing that an outline like that of a hare is visible on the moon); and the plants under his special patronage are a certain variety of the lotus, which flowers when the moon rises, and the soma plant, or *asclepias acida*. As the receptacle of the beverage of immortality, he is thus described in the Vishnu-Purâna: "The radiant sun supplies the moon, when reduced by the draughts of the gods to a single digit, with a single ray; and in the same proportion as the ruler of the night is exhausted by the celestials, it is replenished by the sun . . . . ; for the gods drink the nectar accumulated in the moon during half the month; and from this being their food, they are immortal: 33,000, 3,300, and 33 divinities drink the lunar nectar. When two digits remain, the moon enters the orbit of the sun, and abides in the ray called Amâ. . . . . In that orbit, the moon is immersed for a day and night in the water, thence it enters the branches and shoots of the trees, and thence goes to the sun. . . . . When the remaining portion of the moon consists of but a 15th part, the manes approach it in the afternoon, and drink the last portion, that sacred digit which is composed of nectar. . . . . In this manner the moon, with its cooling rays, nourishes the gods in the light fortnight (or the 15 days of the moon's increase), the manes in the dark fortnight (when in the wane); vegetables, with the cool nectary aqueous atoms it sheds upon them; and through their development it sustains men, animals, and insects, at the same time gratifying them by its radiance."

MOON'JAH, MUNJAH, or MOONYAH (*saccharum munja*), a grass of the same genus with the sugar-cane, a native of India, the leaves of which afford a useful fiber, of which ropes are made. The moonjah grows in vast abundance in the neighborhood of the Ganges, Indus, and other rivers. The fiber of the moonjah is very tough and strong. No proper trial seems yet to have been made of the qualities of the moonjah fiber, more carefully prepared; but considering the facility with which it could be obtained in any desirable quantity, it seems to deserve attention.—Very similar to the moonjah is the SARA or SHUR of Bengal (*saccharum sara*), another species of the same genus, the leaves of which are employed in the same way.

MOON, MOUNTAINS OF THE. The "Mountains of the Moon" have ever played an important part in the history of African geography, and have given rise to many curious hypotheses. Ptolemy, and until lately many of the ablest geographers, supposed that a very high chain of mountains crossed the continent of Africa from e. to w.; and they have continued to shift these mountains from one latitude to another, ranging from 10° n. to 10° s., but still keeping them within nearly the same meridional bounds. Dr. Beke, from his own researches and a minute study of the geography of eastern Africa, propounded the theory, that the so-called Mountains of the Moon run from n. to s. parallel to the coast of Zanzibar, instead of from e. to w.; forming, in fact, a continuation of

the great Abyssinian table-land, and embracing the snow-capped mountains of Kenia and Kilimandjaro, which have an altitude of 20,000 feet.

The mass of mountains discovered by capt. Speke in 1858, round the head of lake Tanganyika, is considered by him, both from its crescent form and its position, to be part of the Mountains of the Moon of Ptolemy; but mountains of this height (6,000 to 10,000 ft.) could never be snow-clad so near the parallel of the equator.

. MOONSEED, or yellow parilla, *menispermam canadense;* nat. order *menispermaceæ* (q.v.). The Canadian moonseed is a North American climbing plant having peltate, roundish-cordate, and angular leaves, small clusters of greenish-yellow flowers, and black, glaucous, roundish, kidney shaped drupes (stone fruit). The root was formerly known in commerce as Texas sarsaparilla; its botany was established by R. P. Thomas in 1855. The root is several feet long, about a quarter of an inch thick, cylindrical when dry, with longitudinal wrinkles, and thin, branching rootlets. It contains a small quantity of berberine, and a larger quantity of a white alkaloid soluble in ether, alcohol, and much water. It also contains starch, and other constituents which have not been examined. It is regarded as a tonic, alterative, and diuretic, similar in properties to sarsaparilla, and is used in scrofulous affections as a substitute for that plant.

MOONSTONE. See FELDSPAR.

MOORCROFT, WILLIAM, about 1780–1825; b. England; one of the earliest of veterinary surgeons, and also one of the earliest explorers of the Himalayas, and the lakes, rivers, and valleys of Chinese Tartary. An account of his travels was published in London in 1841, edited by prof. H. H. Wilson, entitled *Travels in the Himalayan Provinces of Hindustan and the Punjab, in Ladakh and Kashmir.*

MOORE, a co. in central North Carolina, drained by Cape Fear, Deep, and Little rivers, and many creeks; and traversed by the Raleigh and Augusta railroad; 760 sq.m.; pop. '80, 16,821. The surface is hilly and broken, covered in great part by forests. Cotton, Indian corn, wheat, and pork are the staples; coal has been found. Chief town, Carthage.

MOORE, a co. in s. central Tennessee, organized in 1872; drained by the Elk river and its creeks, and traversed by the Nashville, Chattanooga and St. Louis railroad; 160 sq.m.; pop. '80, 6,235—785 colored. The surface is broken and hilly, covered in great part by forests of oak, chestnut, walnut, and other valuable timber. The staple products are wheat, corn, and oats; limestone is found. Co. seat, Lynchburg.

MOORE: co., Texas. See page 883.

MOORE, ALFRED, 1755–1810; b. N. C.; became capt. in 1775 in a North Carolina regiment whose col. was his uncle, col. James Moore. He afterwards threw up his commission, but, after the capture of Wilmington by the British, he enlisted a volunteer force, which did good service during the remainder of the war. In 1790, when his knowledge of the law was still extremely scanty, he was elected by the state legislature attorney-general, and he soon acquired sufficient legal learning to discharge with credit the duties of that office. In 1798 he took a seat on the bench of the state court, from which he was promoted the next year to the supreme court of the United States, where he remained till 1805.

MOORE, BENJAMIN, D.D., 1748–1816; b. Long island; graduated at King's, now Columbia college, in 1768; admitted to the ministry as deacon and priest in England, in 1774, by the bishop of London; returned to America and was assistant minister of Trinity church, New York, 1774–1800; became rector in 1800. In 1801 he was consecrated bishop of the Protestant Episcopal church of New York, and also appointed professor of logic and rhetoric in Columbia college. He was president of the college, 1800–11, continuing also to perform the duties of the ministry. Dr. Hobart, who succeeded him, was his assistant after he became disabled from paralysis. He was an accomplished scholar and an able preacher. He published two sermons in the *American Preacher;* also, a *Sermon before the General Convention; A Pamphlet in Vindication of Episcopal Services.* His *Posthumous Sermons* were published by his son, Clement C. Moore.

MOORE, CHARLES WHITLOCK, b. Boston, 1801; a prominent freemason, and for many years secretary of the Massachusetts grand lodge. He established *Zion's Herald,* at Boston, in 1823, and the *Freemason's Monthly Magazine* in 1841. He has published a number of masonic manuals.

MOORE, CLEMENT CLARK, LL.D., 1779–1863; b. in New York; son of bishop Moore of R. I.; educated at Columbia college, graduated in 1798, and, having made a specialty of the study of Hebrew, was appointed professor of biblical learning in the Protestant Episcopal theological seminary of New York (1821), having already, in 1809, published a Hebrew and English lexicon. In this institution he remained, some changes being made in the title of his professorship, until 1850, when he retired with the title of professor emeritus. The plot on which the seminary stands was the gift of Dr. Moore. He was a poet of merit; published a collection of poems in 1844, and in 1850 *George Castriot.* By far the best known of his poetical writings is the ballad beginning "'Twas the night before Christmas; and all through the house," etc.

MOORE, Erasmus Darwin, b. Conn., 1802; studied theology at New Haven in 1830; was pastor of the Congregational church at Natick, Mass , 1833–38, of Barre 1840–42; edited the *Boston Recorder* 1844–46, *Boston Reporter* 1846–49, *Congregationalist*, 1849–51. He published *Life Scenes in Mission Fields.*

MOORE, Frank, b. N. H., 1828; brother of George Henry. Became a journalist and general writer, in early life; in 1869 was appointed secretary of legation at Paris, and resided there, in the performance of his official duties, during the period of the Franco-German war and the commune. He edited and prepared the *Rebellion Record*, a voluminous and valuable chronicle of the American rebellion of 1860–65, published in 12 vols., 1861–71. He published *Diary of the American Revolution*, 2 vols.; *Songs and Ballads of the American Revolution; Lyrics of Loyalty* (songs of the war against rebellion); and *Rebel Rhymes and Rhapsodies*—a similar collection made from among the writers of the confederate side. In recent years he has devoted himself to journalism in New York, and was in the year 1881, an editorial writer on the *N. Y. Commercial Advertiser.*

MOORE, George Henry, ll.d., b. N. H., 1823; went to New York at the age of 16 years, and assisted his father, then librarian of the N. Y. historical society, whom he succeeded in that position in 1849. He remained in this office until the foundation of the Lenox library, when he was named by the late James Lenox, esq., founder of the library, to be its first superintendent, which position he still holds (1885). He received his degree of ll.d. from the university of New York. He is a learned bibliographer and a skilled administrator, and to his capacity the N. Y. historical society owes in a great degree its progress from an insignificant beginning to a secure and eminent position among the leading literary institutions of the country. Mr. Moore has been a writer on certain special subjects concerning which he is a recognized authority. He published *The Treason of Charles Lee; Employment of Negroes in the Revolutionary Army; Notes on the History of Slavery in Massachusetts;* and *History of the Jurisprudence of New York.*

MOORE, Sir Henry, 1713–69; b. Jamaica; was made a baronet for suppressing a slave insurrection while governor of Jamaica; and next received the appointment of governor of New York, an office he retained from 1769 until his death.

MOORE, Henry, 1751–1843; b. in Dublin; became a Wesleyan Methodist; was admitted to probation in 1779, and for some years preached in Ireland, after which he was associated personally in John Wesley's work. As a revivalist and a preacher he had great success, and was the last to die of those whom Wesley had ordained. He wrote the *Life of John and Charles Wesley and Memoirs of the Family* (1824); *Memoir of Mary Fletcher;* and an autobiography, accompanied by an account of his life written by Mrs. Richard Smith (1844).

MOORE, Jacob Bailey, Jr., 1797–1853; b. N. H.; learned the printer's trade in Concord, where he worked in the office of the *Patriot*, a newspaper to which he contributed. He married into the family of the proprietor, and was taken into partnership by him but left the paper to found the *N. H. Statesman*, for the purpose of pressing the election of John Quincy Adams to the presidency. In 1828 he was made a member of the state legislature, and in the following year sheriff of Merrimack co., a position which he held for five years. He also edited the *N. H. Journal;* and in 1839 went to New York, where, for a brief period, he edited the *Daily Whig.* In 1841–45 he was employed in the post-office in Washington. In 1845 he was appointed librarian of the N. Y. historical society library, and in 1848 postmaster at San Francisco, Cal. He was one of the compilers of Farmer and Moore's *Historical Collections of New Hampshire*, one of the earliest publications in American local history. He also published a *History of Concord, N.H.; Laws of Trade in the United States; History of Andover; Gazetteer of New Hampshire;* and *Memoirs of American Governors.*

MOORE, Jesse Haile, b. Ill., 1817; educated at McKendree college, Lebanon, and in 1844 became principal of Georgetown seminary. He became pastor of the Methodist Episcopal church at Shelbyville in 1848, and was successively principal of Paris seminary and president of Quincy college. In 1862 he raised the 115th regiment of Illinois volunteers, and served through the war, retiring at its close with the brevet rank of brig. gen. He served in Congress, 1869–73.

MOORE, John, d.d. See page 883.

MOORE, John, m.d., a Scottish physician and miscellaneous writer, son of the rev. Charles Moore, an Episcopalian clergyman, was born at Stirling in 1730. Educated at the university of Glasgow, he began the study of medicine and surgery under Dr. Gordon, surgeon, of that city, which study he followed up in Holland, London, and Paris, and then, as the partner of his old master, Dr. Gordon, began to practice in Glasgow. As medical attendant to the duke of Hamilton, he spent five years traveling on the continent, and on his return in 1778 settled in London. In 1779 he published *A View of Society and Manners in France, Switzerland, and Germany* (Lond. 2 vols. 8vo). In 1781 appeared *A View of Society and Manners in Italy* (2 vols. 8vo); in 1786 his *Medical Sketches*, in two parts; and in 1789 *Zeluco*, a novel (2 vols. 8vo)—the principal, or, at any rate, the most popular of his works. His other works are: *A Journal during a Residence in France*, 1792 (2 vols. Lond.), descriptive of scenes witnessed while at

Paris in the autumn of that year as medical attendant of the earl of Lauderdale; *A View of the Causes and Progress of the French Revolution* (2 vols. Lond. 1795); *Edward*, a novel (Lond. 1796); and *Mordaunt*, a novel (Lond. 1800, 3 vols. 8vo). He also edited a collected edition of Smollett's works, with a life of the author. He died at Richmond in Surrey, Feb. 20, 1802.

MOORE, Sir JOHN, English gen., born at Glasgow 1761, was eldest son of the preceding. He entered the army as ensign when only 15, and served with distinction in Corsica as col.; in the West Indies as brig.gen.; in Ireland during the rebellion of 1798, and in the expedition to Holland as gen. of staff. He was in Egypt with the army under Abercromby, and obtained the order of the bath for his services in command of the reserve. When war again broke out in 1802 Moore served in Sicily and Sweden. In 1808 he was sent with a corps of 10,000 men to strengthen the English army in the peninsula. He arrived in Mondego bay Aug. 19, and assumed the chief command on the return to England of sir H. Burrard. In October he received instructions to co-operate with the forces of Spain in the expulsion of the French from the peninsula. He moved his army from Lisbon, with the intention of advancing by Valladolid to unite himself with the Spanish gen. Romana, and threaten the communications between Madrid and France. But the apathy of the Spaniards, and the successes of the French in various parts of the peninsula, soon placed him in a critical position. Yet he had determined to make a bold advance from Salamanca to attack Soult, when the news reached him that Madrid had fallen, and that Napoleon was marching to crush him at the head of 70.000 men. Moore's forces amounted to only 25,000 men, and he was consequently forced to retreat. In December he began a disastrous march from Astorga to Corunna, a route of nearly 250 miles, through a desolate and mountainous country, made almost impassable by snow and rain, and harassed by the enemy. The soldiers suffered intolerable hardships, and arrived at Corunna in a very distressed state. It was impossible to embark without fighting, and Soult was in readiness to attack as soon as the troops should begin to embark. The battle was mainly one of infantry, for the cavalry, after destroying their horses, had gone on board, and the bulk of the artillery, for which the ground was not adapted, had also been withdrawn. On Jan. 16, 1809, the French came on in four strong columns. A desperate battle ensued. While animating the 42d regiment in a brilliant charge in an early stage of the action Moore was struck by a cannon-ball on the left shoulder, and died in the moment of victory. The French were defeated with the loss of 2,000 men; and the funeral obsequies of the deceased soldier were performed with melancholy solemnity just before the embarkation of his troops. The British army in this expedition lost their magazines and 6,000 soldiers. A monument was erected to Moore's memory in St. Paul's cathedral.

MOORE, MARTIN, 1790–1866; b. Mass.; graduated at Brown university in 1820; was pastor of a Congregational church at Natick, Mass., for nearly 30 years, and afterwards at Cohasset. He edited the *Boston Recorder* for 20 years. He published *History of Natick; Life of John Eliot.* He was vice-president of the New England genealogical society in 1861–6.

MOORE, NATHANIEL, F.LL.D., 1782–1872; b. New York; educated at Columbia college, and admitted to the bar. In 1817 he was appointed adjunct professor, and in 1820 full professor of Greek and Latin in Columbia college, where he remained till 1835, when he went abroad. On his return in 1837 he became librarian of the college, to whose presidency he was called in 1842. He held that office till 1849. He published *A Historical Sketch of Columbia College; Ancient Mineralogy; Lectures on the Greek Language and Literature;* and *Remarks on the Pronunciation of the Greek Language.*

MOORE, RICHARD CHANNING, D.D., 1762–1841; b. New York; educated at King's, now Columbia, college; became a physician; entered the ministry of the Protestant Episcopal church; was pastor at Rye, N.Y.; rector of St. Andrew's, Staten island, 1789–1809; rector of St. Stephen's, New York, 1809–14; consecrated bishop of Virginia in 1814 as successor of bishop Madison. He was a prominent leader in the evangelical branch of the Episcopal church. During the last twelve years of his life he had as an assistant bishop Meade, who succeeded him as bishop of the diocese. He published many *Charges*, and a sermon on *The Doctrines of the Church.*

MOORE, THOMAS, the son of a small tradesman, who, through the influence of lord Moira, afterwards became a barrack-master in the army, was born in Dublin on May 28, 1779. At an early age he was placed at a school in which Sheridan had formerly been a pupil. In 1793 he was sent to the Dublin university, where he ultimately took the degree of B.A. Before entering the university he had written verses for a Dublin magazine; and while there he translated the *Odes* of Anacreon, in the hope of obtaining a classical premium, in which, however, he was disappointed. In Dublin he acquired Italian and French, and being fond of music, he learned to play on the piano—an accomplishment which was of service to him in his future career.

In 1798, with his translation of Anacreon in his pocket, he came to London to study law, and entered himself in the Middle Temple. In 1800 he published his translations, dedicated to George IV., then prince of Wales. In 1802 he produced his *Poetical Works of the Late Thomas Little*—a volume of sweet but licentious verse, which was a good deal

blamed, and very widely read. In 1803, through the influence of lord Moira, he was appointed to a government post at Bermuda. He arrived there in Jan., 1804; but finding his situation disagreeable, he committed his duties into the hands of a deputy, and traveled in America previous to his return to England. His transatlantic experience seems to have cured him of the democratic ideas which he had imbibed in Dublin. On his return to England, he published *Odes and Epistles*, for which he was sharply taken to task in the *Edinburgh Review*. A duel between himself and Jeffrey was the consequence—over which Byron made so much mirth—and which resulted in the combatants becoming the most excellent friends. In 1807 he engaged with Mr. Power to produce the *Irish Melodies*, and on this work he was engaged at intervals up till 1834. In 1811 he married, and shortly after he went to reside in Derbyshire, where in 1813 he produced *The Twopenny Post-bag*, full of brilliant fancy—in which the tropes not only glittered but stung.

As up to this time he had produced nothing but fugitive pieces he became anxious to emulate his brethren, who wrote long poems, and published in quartos. He fixed on an oriental subject, and the Messrs. Longman agreed to purchase the poem for 3,000 guineas. In 1817 the long-expected *Lalla Rookh* appeared—brilliant as a fire-fly, and the whole English world applauded. After the publication he went to Paris, where he wrote *The Fudge Family*, which appeared in 1818. At this time he learned that his deputy in Bermuda had misconducted himself, and that he had become liable for a large sums, which was afterwards, however, considerably reduced. Lord Lansdowne paid the claim, and Moore repaid his lordship afterwards.

In 1819 Moore went to Paris with lord John Russell, and extended his tour to Italy, and saw lord Byron at Venice. He returned to Paris, where he brought his family, and fixed his residence till 1822. Here he wrote *The Loves of the Angels*, which appeared in 1823, and *The Epicurean*, a prose romance, which was not published till 1827. On his return to England he fixed his abode at Sloperton cottage, near Bowood, and issued the *Memoirs of Captain Rock* in 1824, and the *Life of Sheridan* in 1825.

Byron had handed over to Moore, for his own especial benefit, a manuscript autobiography, on the condition that it should not see the light till after its author's death. Byron died in 1824, and as, at the request of his lordship's relatives, the manuscript was destroyed, Moore then entered into arrangements with Murray to produce a life of the deceased poet. The *Life of Lord Byron* was published in 1830, in two volumes. Next year he published the *Life of Lord Edward Fitzgerald*. His last important work was a *History of Ireland*, published in *Lardner's Cyclopædia*. A pension of £300 per annum was conferred on him in 1835. In 1841 he brought out an edition of his entire poetical works. For the three years preceding his death, he was afflicted with softening of the brain. He died Feb. 25, 1852. His friend, lord John Russell, published his *Memoirs, Journal, and Correspondence*, in 8 vols. (1852–56).

Despite his popularity during his lifetime, Moore can hardly be placed in the rank of great poets. His muse is a spangled dancing-girl—light, airy, graceful, but nothing more. His most ambitious work, *The Loves of the Angels*, is far beneath the Miltonic, or even the Byronic standard. *Lalla Rookh* is brilliant, but fatiguing. He is most successful in polished satire and the lighter sentiments; and his reputation will ultimately rest on *The Twopenny Post-bag* and the *Irish Melodies*.

MOORE, William, b. Penn., in the 18th c.; father of the marchioness de Marbois. He was president of the state executive council for two years, from 1781, and long a merchant in Philadelphia.

MOORE, Zephaniah Swift, D.D., 1770–1822; b. Mass.; graduated at Dartmouth college in 1773; was pastor of the Congregational church at Leicester, Mass., in 1798; elected professor of languages in Dartmouth college in 1811; president of Williams college in 1815, and of Amherst in 1821. He was especially interested in natural science. He published *An Oration at Worcester; An Address to the Public in respect to Amherst College;* and two occasional *Sermons*.

MOORFOWL, Red Grouse, or, in books of natural history, Red Ptarmigan or Brown Ptarmigan (*Lagopus Scoticus*), a bird peculiar to the British islands, and affording more amusement to sportsmen than any other kind of feathered game in Britain. It is the bird generally known in Britain by the name *grouse*, although not a true species of grouse, but rather of ptarmigan (q.v.). The toes are completely feathered, as well as the legs; the bill is very short, and its base much concealed by feathers. The length of the moorfowl is about 16 in., of which about 4 in. belong to the tail. The tail is nearly square. The wings are short. The plumage is of a deep chestnut-brown color, marked on the back and wing-coverts with black spots, and on the under parts with undulating black lines; the four middle tail-feathers are also marked with transverse black lines. Above the eyes is a naked space (the cere), of a bright scarlet color. The moorfowl is plentiful in the moors of Scotland and the Hebrides, Wales, the north of England, and Ireland. It feeds on the tender tops of heath, crowberries, bilberries, etc.; and not unfrequently visits the fields of oats and other grain in the vicinity of the moors, particularly when the *stooks* remain long in the field in late and rainy harvests. The moorfowl is not polygamous, and pairs in spring, when the plumage—particularly of the male—assumes a lighter and redder tint. The female lays from eight to fifteen eggs. The

nest is on the ground, often under shelter of a tuft of heath. The young run about very soon after they are hatched. "Grouse" remain in *coveys* (broods) from the time they are hatched till late in the autumn, after which they "pack" or assemble in large bodies. A cream-colored variety of moorfowl is sometimes found in the north of England. The moorfowl is easily domesticated, and breeds readily in an aviary, if supplied with heath for food.

MOORHEN. See GALLINULE.

MOORING (allied probably to Dutch *marren*, to delay, fasten; Eng. *marline*, for fastening the sail to the bolt-rope; Lat. *mora*, delay), a fastening to retain a ship in a given position. This may be either by her own anchors, or (which is the more common meaning of the term) by fixed and permanent buoy, which, on its part, is anchored to the bottom. A chain-mooring is where a strong chain is stretched for some distance on the bottom, being securely anchored or otherwise made fast at each end, and perhaps in intermediate places. Numerous buoys are then floated from it, and it becomes the mooring-ground for many vessels. Chain-moorings are frequent in all large harbors where comparatively small vessels require to ride.

MOORISH ARCHITECTURE. See ARABIAN ARCHITECTURE.

MOORS (Lat. *mauri*, meaning dark; Spanish, *moros*) are a people who form the great majority of the population of Barbary. Their appearance indicates their origin, which is a mixture of the Mauri (from whom they derive their name), Numidians, Phenicians, Romans, and Arabs, who have successively held possession of the country. In consequence, they are found to vary considerably in appearance and character in different parts of Barbary, but all show more or less strongly the symptoms of a considerable infusion of Arabian blood. They are a well-formed race, with fine oriental features, and a mild and melancholy expression of countenance. They are more friendly and sociable than the Bedouins and Berbers, who inhabit the deserts and mountains; but are inferior to them in mental ability, besides being voluptuous and cruel. They constitute, generally speaking, the tradesmen, artizans, merchants, and agriculturalists of Barbary; but a considerable number lead a pastoral life. The dress of the Moors consists of a piece of woolen cloth, five ells in length by one and a half in breadth, called a "haique," which is thrown over the shoulders, and fastened round the body; it also serves as a covering by night. This, when supplemented by a pair of slippers, a red cap, and a hood, constitutes the sole habiliment of the people generally. In the towns, the "caftan" is generally worn over the haique. The Moors employ the Arabic language, but with many corruptions and deviations from the original, and these appear to increase toward the west.

As the Arab conquerors of Spain invaded that country from Africa, where they had largely recruited their forces, they were naturally enough called Moors, and in Spanish history the terms Moors, Saracens, and Arabs are synonymous. From this mixed Moorish-Arab race sprung the *Moriscoes*, who were permitted by Ferdinand the Catholic to remain in Spain after the expulsion of their countrymen, on condition of their embracing Christianity. A cruel persecution, which was originated by Philip II., drove them to rebellion (1567–70), and in 1571 many emigrated to Africa; those who remained being, to the number of 500,000, expelled in 1610 by Philip III.

The Moors first appear in modern history as the allies of the Vandals in their invasion of Africa, and were continually rebelling against the Byzantine emperor. They were next, after a severe struggle, conquered and converted by the Arabs in 707. In 1091 they were summoned by the latter into Spain, to aid in stemming the tide of Christian conquest; and after faithfully supporting the Arab calif of Cordova, etc., till his dominions fell into the hands of the king of Leon and Castile, they retired in 1238 to Granada, where they founded their kingdom. The kings of Granada carried on a vigorous, and, at the same time, chivalrous warfare with the kings of Castile; but at length, weakened by internal discord, were compelled to succumb to Ferdinand the Catholic in 1492. The Moors, or at least that portion of them who refused to adopt Christianity, were then expelled from Spain, and, in revenge, founded in 1518 the piratical states of Algiers and Tunis. Their subsequent history cannot be separated from that of Algiers, Tunis, and Morocco.

MOORSHEDABAD', a city in Hindustan, in a district of the same name, and in the province of Bengal, of which it was formerly the capital; 124 m. n. of Calcutta; pop. 46,182. Its name originally was Muksoosabad. Including Cossimbazar it extends 8 m. on both sides of Bhagiratty or Cossimbazar river, a branch of the Ganges. The city was never fortified except by an occasional rampart during the Mahratta invasion in 1742. The streets are so narrow as to be impassable for European carriages. The buildings are generally of mud. Most of them are of one story, with tiled roofs. Even the palace of the nawaub is hardly noticeable. A long, narrow, winding street runs from the market, containing poor huts, and this is intersected by other streets still narrower and very unpleasant. On account of defective drainage the place is very unhealthy, and in 1814 many Europeans suffered in the general mortality. It has an extensive inland traffic, and the river is constantly covered with boats. The staple products are silk and indigo. The town is favorably situated for commerce. A Mohammedan college, called

Nizamat college, was founded here several years ago, to which an English professorship was attached. In 1757 Calcutta became the capital of Bengal.

MOORUK (*Casuarius Bennettii*), a recently discovered bird of the same genus with the Cassowary (q.v.), of which it was at first regarded as a mere variety, a native of the island of New Britain. It is about 5 ft. in full height, 3 ft. to the top of the back, is of a reddish color, mixed with black, and has a horny plate instead of a helmet-like protuberance on the top of the head. The claw of the inner toe of each foot is very long. It becomes extremely tame and familiar in captivity; may be fed on potatoes, maize, or any similar food; and is apt to prove troublesome by swallowing anything, however indigestible, that may come in its way.

MOOSE. See Elk.

MOOSEHEAD LAKE, the largest lake in Maine, from which the Kennebec river takes its rise. It lies on the borders of Somerset and Piscataquis counties, about 75 m. n. by e. of Augusta; is 36 m. in length, from 3 to 10 in width; and is surrounded by a thickly wooded country that is sparsely inhabited. The forests abound in game, including the deer and caribou; and the lake, with the neighboring region, is much frequented by sportsmen. In the winter the lumbermen of the Kennebec cut much of their timber near its banks.

MOOSH, a t. of Asiatic Turkey, capital of a small pashalic of the same name; population estimated at 6,000. It is pleasantly situated on the sides and summit of a conical hill near the Murad Chaï, or eastern arm of the Euphrates, 75 m. s.e. of Erzeroum. The plain in which it stands is about 40 m. in length and 12 or 14 m. in breadth, and is well-watered. The climate is variable. It contains 100 villages, and produces grain, tobacco, and wine of good quality. The town presents a poor appearance. It is inhabited by Turks and Armenians, the latter, having the trade of the place, are wealthy, and pay an annual tribute of £2,000, from which the Turks are exempt. There are 7 mosques, 4 churches, and several large, well-furnished bazaars. Coarse cotton cloth is manufactured here. The chief articles of export are tobacco and cattle. But a small quantity of European manufactures is imported.

MOQUE GUA, a t. of Peru, capital of a province of the same name, 68 m. n.w. of Tacna, on the great route w. of the Cordilleras. In the province are many large vineyards, which produce great quantities of wine and brandy. Pop. 9,000.

MOQUIS, the name of a tribe of Indians living in n.w. Arizona, on the Little Colorado and San Juan rivers. They are known as far back as the middle of the 16th c., when they were visited by the Europeans, and received from them certain domestic animals, including sheep, the breed of which they continue to hold. Missionaries were sent among them by the Franciscans, but in the latter part of the 17th c. there was a general rising of the Moquis, when the missionaries were exterminated. An attempt in 1723, on the part of the viceroy of Mexico, to subdue this tribe, was unsuccessful; but 25 years later a new Franciscan mission had been effectual in making converts among them. Since that time they became peaceable, only resisting the attacks of the Apaches and Navajoes, who became their bitter foes, and have harassed them greatly. They are agricultural; are divided into 9 subdivisions, or families; and dwell in villages of houses built after the manner of the Indians of New Mexico. At the time when the United States government first took them in charge the Moquis were estimated to number 8,000; but in 1855 they were severely afflicted by an epidemic of small-pox, and their numbers much reduced; and, again, they suffered from famine in 1866. Their number in 1884 was reported at 1813. They are not intemperate, and their women are noted for chastity.

MORA, a genus of trees of the natural order *leguminosæ*, sub-order *cæsalpiniæ*, containing only one knows species, *M. excelsa*, discovered by sir R. Schomburgk, and described by him as the most majestic tree of Guiana. The timber is said to be equal to oak of the finest quality. It is already a considerable article of commerce, under the name of *mora wood*. It is darker than mahogany. It is valued for ship-building.

MO'RA (Lat.) is a word often used in Scotch law to denote delay caused by negligence. In England and Ireland the corresponding word is laches (q.v.).

MORA, a co. in n.e. New Mexico, adjoining Texas; 5,000 sq.m.; pop. '80, 9,751—9,542 of American birth. The surface, especially in the w. portions, is mountainous, intersected in the w. by a ridge from the Rocky mountains. Most of the county is a wide, treeless plain. The Canadian river and Mora creek flow through it. The principal productions are Indian corn, wheat, oats, hay, and wool. There are manufactories of flour and wool. Co. seat, Mora.

MORA, Francis, D.D. See page 883.

MORA'CEÆ, a natural order of exogenous plants, or, according to many botanists, a sub-order of *urticeæ* (q.v.). The moraceæ are trees or shrubs with rough leaves and sometimes with climbing stems; they have a milky juice; the flowers are very small; the fruits of many flowers are often inclosed in a succulent receptacle, or the calyx becoming fleshy, all the fruits of a head or spike become combined into one. There are about 200 known species, natives of temperate and tropical climates. Some are valuable for their fruit, some for the caoutchouc obtained from their milky juice, and dif-

ferent parts of others are applied to various uses. Among the species are figs, mulberries, Osage orange, fustic, and contrayerva.

MORADABAD', a t. of British India, capital of a district of the same name, is situated on a slightly elevated ridge between the Ramgunga and the Ganges, 90 m. e.n.e. of Delhi. There is a large jail, capable of holding 1800, for native convicts. West of the town, and separated from it by the jail, are the cantonments for the troops, agreeably situated amid luxuriant trees; the chief duty of the troops is to guard the convicts. Pop. (at census of N.W. Provinces, 1872) 62,417.

***MORAINE'**. The masses of rock which, by atmospheric action, are separated from the mountains bounding the valleys along which glaciers flow, find a temporary resting-place on the surface of the ice, at the margin of the glacier, and are carried along with it, but so slowly that they form a continuous line along each margin. These lines of débris are called *lateral moraines*. When two glaciers unite, the two inner moraines unite also, and form one large trail in the middle of the trunk glacier, and this is called a *medial moraine*. A large portion of these rocky fragments at length reaches the end of the glacier, and here the melting ice leaves it as a huge mound, which is known as a *terminal moraine*. See GLACIER. See *Supp.*, page 883.

MORALES, LUIS DE, 1509–86; b. Spain; studied the works of the Spanish masters, and was called *El Divino*, "the divine," from his preference for sacred subjects. His Saviors and Magdalenes are exact representations of suffering borne with meekness. His best work is the "St. Veronica" in the church of the Barefooted Trinitarians in Madrid.

MORALITIES. See MYSTERIES.

MORALS. See ETHICS.

MORAN, BENJAMIN, b. Penn., 1820; at first a printer in Philadelphia. He made a tour of England, on foot, in 1850, publishing an account of it in 1853, under the title of *The Footpath and the Highway*. In 1854 he became private secretary to James Buchanan, then American minister to England. In 1855 he was appointed secretary of the American legation in London, where he remained till 1874, when he became minister to Portugal, which post he still retains (1881).

MORAN, EDWARD, b. Lancashire, Eng., 1829; removed with his parents while young to Philadelphia, and became a pupil there of James Hamilton, a well-known marine painter. His work early indicated much aptitude for this class of subjects, and his paintings were of a good order of merit from the first. He went to London in 1862, remained abroad long enough to profit by the study of the great marine painters of England and the continent, and returned to reside in New York in 1869. His works have found steady sale, and have frequently been the originals for engravings. Among them are "Outward Bound," "Lanch of the Life-Boat," "The Burning Yacht," "Minot Ledge Light," "The Coming Storm in New York Bay," "Solitude," and "Dream Life." Mr. Moran is careful in the finish of his pictures, and has confined his brush almost exclusively to marine subjects. He is an associate of the national academy of N. Y., and a member of the society of American artists.

MORAN, PETER, b. Lancashire, Eng., 1842; brought by his parents to Philadelphia, where he was educated, and then put with a lithographer to learn his art. He did not like it; and deserted it for the studios of his elder brothers, where he found his vocation in a field slightly different from theirs and yet allied. His taste led him to pastoral and quiet scenes in country life, and especially to animal painting, though he has not confined himself to still-life pictures. "Twilight," "The Return of the Herd," "The Thunderstorm," "Fog on a Sea-Shore," and "Settled Rain," are the names of a few of the paintings which have given him celebrity, and indicate his appreciation of the poetic aspects of still-life in nature. The "Return of the Herd" received a medal at the centennial exhibition.

MORAN, THOMAS, b. in Lancashire, Eng., 1837. When seven years old his family came to Philadelphia, where Thomas was educated in the city schools, and then apprenticed to Mr. Scattergood, an engraver. During this apprenticeship he devoted all his spare time by day to painting in water colors and the study of painting, and his evenings to drawing. His success was immediate; his water-color paintings sold quickly at good prices. When master of water-colors, and studying from nature, he perceived the greater range of oil painting, and at 23 years of age turned his attention to that department. When 25 he visited England. In 1866 he again went to Europe, visited England, France, and Italy, and remained several years for work. He returned in 1871 and joined prof. Hayden's party of exploration to the head waters of the Yellowstone river, where he made the sketches from which he produced the picture of the "Grand Cañon of the Yellowstone," purchased by congress, and now filling a panel in the capitol at Washington. The following year he visited the Yosemite and the Sierras of California and Nevada. In 1873 he joined the U. S. exploring expedition, conducted by maj. J. W. Powell, which surveyed the wonderful canyons of the Colorado river in Colorado and Utah, and on his return completed a picture of "The Chasm of the Colorado," which was purchased by congress as a companion to the Yellowstone picture. The following year he visited the mountain of the Holy Cross in Colorado, and on his return

to New York, where he has made his residence, he finished a picture of that mountain, which ranks as one of his grand works. These are a few of Mr. Moran's large works. Of smaller pieces he has been a prolific worker in every department of landscape art. Among these are: "The Lost Arrow," "The Ripening of the Leaf," "Dreamland," "The Groves were God's First Temples," "The Pictured Rocks of Lake Superior," "The Conemaugh in Autumn," "The First Ship," "The Flight into Egypt," "The Remorse of Cain," "The Children of the Mountain," "The Track of the Storm," "Ponce de Leon in Florida," "New York from Communipaw," and "After a Thaw." It is to Mr. Moran's skilled pencil that the world is indebted for the superb illustrations on wood that adorn the reports of both Hayden's and Powell's explorations and the most spirited recent engravings of Rocky mountain scenery. "The Wonders of the Yellowstone," which have been illustrated in chromo by L. Prang & Co., are from his water-color sketches. Mr. Moran's style is marked neither by over-care nor by carelessness of finish. In the "After a Thaw," a locomotive on the flushed flats of New Jersey, seen through a spring mist, becomes a picture of poetic beauty.

MORA'NO, a city of southern Italy, in the province of Cosenza, built on a hill in a wild and rugged neighborhood, 35 m. n.n.w. of Cosenza. Pop. 8,350. It has good manufactures of silk, cotton, and woolen fabrics.

MORAT (Lat. *Moratum*, Ger. *Murten*), a t. of, '71, 2,328 inhabitants, in the canton of Freiburg, Switzerland, on the lake of Morat, about 12 m. from Bern, famous for the victory of the Swiss and their allies over Charles the bold, duke of Burgundy, June 22, 1476. The duke, exasperated by his defeat at Grandson in March, appeared before the gates of Morat with 40,000 men. The Swiss were aided by Strasburg, Basel, Colmar, and other Rhenish cities, and by duke René of Lorraine, whom the duke of Burgundy had driven from his possessions; but the superiority of numbers was greatly on the side of the duke of Burgundy. The assault of the Swiss, however, was very impetuous, and their victory complete; the duke's camp fell into their hands, and he himself only escaped by the swiftness of his horse.

MORATA, Olympia Fulvia, 1526–55; b. Ferrara; was carefully educated, and became an accomplished classical scholar. She is said to have given lectures on classical subjects at Ferrara in her 16th year. She afterward married a German physician named Andreas Grunthler, and was converted to Protestantism. In 1553 margrave Albert of Brandenburg pillaged Schweinfurt, where she was living, and she lost her library, and was forced to take refuge in Hammelburg. Grunthler was presently appointed a professor at Heidelberg, where she went to reside. She published many poems, written in Greek or Latin.

MORATIN, Leandro Fernandez de, the most eminent comic poet that Spain has produced in recent times, was b. at Madrid Mar. 10, 1760. His father, Nicolas Fernandez de Moratin, was also a poet of some eminence, but having found that literary labors afforded a precarious support, he wished his son to learn the trade of a jeweler, by which, after his father's death, he, in fact, for some time supported himself and his mother. In 1790 appeared his first and best comedy, *El Viejo y la Nina;* it was followed by *La Comedia nuova El Baron*, *La Mogigata*, and *Elsi de las Niñas.* Prince Godoy conferred several ecclesiastical benefices upon him, though the inquisition set its evil eye upon the poet. Joseph Bonaparte made him chief royal librarian; and after 1814 he took refuge in Paris. His last work was the *Origenes del Teatro Español.* He died in Paris June 21, 1828.

MORATIN, Nicolas Fernandez de, 1737–80; b. Madrid; a friend of Montiano, the restorer of classical tragedy in Spain. Following the example of Montiano and Luzan, he attempted to reform the drama, and to purge it of romanticism. In 1762 he published three discourses against the older drama, under the title of *Desengaños al Teatro Español.* In these discourses he bitterly attacked the old characteristic *Autos Sacramentales,* which were suppressed by the government in 1765. In the same year that the discourses appeared he wrote a comedy, *La Pentimétra*, in the French manner: neither this, nor his tradgedy *Lucrecia*, was represented, on account of the strong prejudice then prevailing in Spain against French innovations. In 1770 he succeeded in having his tragedy of *Hormesinda* produced on the stage, and it was favorably received. He wrote but one more tragedy, *Guzman el Buene*, which was never performed. Before this, he had turned his talents in the direction in which he was to do his best work, and had published, in 1764, a collection of verses called *El Poéta.* This was followed the next year by *Diana*, a didactic poem on the chase. His most important work, a historical epic called *Las Náves de Cortès Destruidas*, appeared the same year. Moratin at first practiced law, but was afterward made professor of poetry in the imperial college at Madrid. He formed a club, which met at Madrid and considered the productions of contemporary literature. He was on intimate terms with the chief scholars and authors of Spain.—Cadahalso, Ayala, Montiano, the botanist Ortega, and Fajardo, the translator of Buffon. His posthumous works were published by his son Leandro, in 1821.

MO'RAVA, the chief river of Servia. It is formed by the union of two head streams —the eastern or Bulgarian Morava, which rises in the mountains to the s. of the new

southern frontier of Servia; and the western or Servian Morava, which rises on the western frontier. The united stream flows northward to the Danube, and has a total length of about 180 miles.

MO'RAVA, or, more properly, March (called by the ancients *Marus*), a river of Austria, has its origin on the southern slope of the Schneeberg, on the borders of Prussian Silesia, 3,882 ft. above sea-level. It is the chief river of Moravia, to which it gives its name, and flows s. through that crown-land, receiving on the right the Thaya, and falling into the Danube, 8 m. above Presburg. In its lower course, it forms the boundary between Lower Austria and Hungary. Its course is 184 m. in length, and it is navigable from Göding, upward of 60 m. from its mouth.

MORA'VIA (Ger. *Mähren*), a crown-land of the Austrian empire, situated in 48° 40′ to 50° n. lat., and 15° 5′ to 18° 45′ e. long. It is bounded n. by Prussian and Austrian Silesia, e. by Hungary and Galicia, s. by the duchy of Austria, and w. by Bohemia. The superficial area is about 8,480 sq.m.; and the pop. in 1880 was 2,153,406.

Moravia is inclosed and traversed on all sides by mountains, being separated from Silesia by the range of the Sudetes; from Bohemia, by the Moravian chain; and from Hungary, by the Carpathian mountains; while branches of these various chains intersect the whole country except in the s., where the land consists of extensive plains, lying about 800 ft. above the level of the sea. The numerous small rivers of the interior follow a s.e. direction, and fall into the March or Morava, from which the country derives its name, and then flow together with the latter into the Danube. The Oder, and its affluents the Elsa and Oppa, rise among the mountains on the n.e., from whence their course is soon turned directly away from the Moravian territory. There are few extensive lakes, but numerous ponds and small streams, which abound in fish. The more elevated parts of the country are not fertile, and the climate is severe; but in the mountain valleys and on the southern plains the soil is remarkably rich, and the temperature more genial than in other European countries lying in the same parallel. Moravia, which ranks as one of the richest of the Austrian dominions, has half of its area in arable land. It yields fine crops of grain, and among the other natural products grown for exportation we may instance hops, mustard, potatoes, clover-seed, beet-root; and in the s., maize, grapes, chestnuts, and many other of the less hardy fruits and vegetables. The breeding of cattle and sheep, and the making of cheese from sheep's milk, constitute an important branch of industry; in the southern districts of the Hanna (a plain famous for its fertility), horses are bred for exportation. Geese and fowls are reared in large numbers for the sake of their feathers, and the keeping of bees is conducted with great success. The mineral products include iron, alum, saltpeter, coal, graphite, wetstones, sulphur, vitriol, pipe-clay, marble, and topazes, garnets, and other precious stones.

Industry, etc.—The principal branches of industry are the manufacture of linen and thread, which now enjoy a European reputation, and those for cotton goods at Sternberg. Moravia has long been noted for the excellence of its cloths, flannels, and other woolen fabrics, and for its leather goods. The minerals of Moravia, especially coal and iron, are important, and are extensively wrought. Beet-sugar is largely manufactured. Brünn (q.v.), the capital, is the chief emporium for the manufacturing trade, and Olmütz (q.v.) the principal cattle-mart.

The educational wants of the province are provided for by 12 gymnasia and about 1900 schools. The former university at Olmütz is now represented by a theological faculty, and by a large technical institute. The majority of the people belong to the church of Rome. There are about 50,000 Protestants and 40,000 Jews.

In regard to nationality, the population may be divided as follows: About 500,000 Germans, nearly a million and a half of Slavs, and 50,000 belonging to other races (including Jews). The Slavs of Moravia are mostly Czechs, with Poles and a few Croats. The Czechs are inferior in all respects to their brethren in Bohemia. The Moravian Poles, although inferior to the Germans as regards industry and cultivation, are a physically well developed, courageous, and enterprising people.

History.—Moravia was anciently occupied by the Quadi, who, on their migration in the 5th c. to Gaul and Hispania, were replaced first by the Rugii, next by the Heruli and Longobardi, and finally by a colony of Slavonians, who, on their settlement in the country, took the name of Moravians, from the river Morava. Charlemagne, who brought the people under nominal subjection after they had spread themselves over a territory greater than the present Moravia, constrained their king, Samoslav, to receive baptism; but Christianity was first formally established in the middle of the 9th c. by Cyril, who must be regarded as the true apostle of the land. Moravia was made tributary to the German empire before the close of the century; but in 1029 it was incorporated with Bohemia, after having for a time been a prey to the incursive attacks of its Slavonic and Teutonic neighbors. At the close of the 12th c. Moravia was erected into a margraviate, and declared a fief of Bohemia, to be held from the crown by the younger branches of the royal house. On the death of Louis II. at the battle of Mohacz in 1526, Moravia, with all the other Bohemian lands, fell to Austria, in accordance with a pre-existing compact of succession between the royal houses. Since then it has shared the fortunes of the empire, and in 1849 it was formally separated from Bohemia, and declared a distinct province and crown-land.

MORAVIANS (called also *United Brethren*, *Moravian Brethren*, or *Bohemian Brethren*), a religious community, tracing its origin to the followers of John Huss, who were expelled by persecution from Bohemia and Moravia in the beginning of the 18th c., and of whom a small company, consisting at first of only 10 persons, received permission from count Zinzendorf (q.v.), in 1722, to settle on his estate of Berthelsdorf, in Saxony. To this settlement they gave the name of Herrnhut, whence they are commonly known in Germany as Hernhuters. It rapidly increased, not only by the accession of additional Bohemian and Moravian refugees, but also of other Christians, who were attracted by the faith and piety which remarkably prevailed in it. Zinzendorf joined the little brotherhood, devoted his whole estate to the propagation of Christianity, and undertook the work of the ministry. The doctrines which they received being those of the Augsburg confession, it was proposed that they should unite themselves with the Luthern church; but a difference of opinion existing on this point, it was decided, as difficult questions still sometimes are among the Moravian, by an appeal to the lot; and the result was, that the *United Brethren*, or *Unitas Fratrum*, as they termed themselves, remained a distinct community, and adopted an organization of their own. Till Zinzendorf's death in 1760, he was really their leader, and was recognized by them as *ordinarius*. After his death, their organization was completed by synods held in 1764 and 1769.

The Moravians are recognized by the state in Germany, as Protestants attached to the Augsburg confession. They have no symbolical books of their own, although they drew up a simple and brief confession of their faith in 1727, and a brief statement of principles was emitted by a synod held in 1775.

The Moravians profess to be connected with the Bohemian or Moravian Brethren of former times by a regular succession of bishops. The bishops, however, exercise no episcopal authority, and their chief peculiar function is that of ordination, of which they alone have the power. Every congregation is governed by a *conference of elders*. The elders are bound to visit each family once in three months, and to report concerning the maintenance of family worship and the conduct of the brethren. It is also their duty to visit the sick, and to aid the poor with money contributed by the other brethren. The whole church is governed by synods, which meet—always in Germany—at intervals of ten or twelve years, and are composed not only of bishops, but also of other members of the brotherhood. Between one synod and another, all affairs are managed by a *conference of elders* appointed by the synod.

Moravians are to some extent scattered amongst the general population of the countries in which they dwell, as Britain and America; but they prefer, where it is possible, to live in colonies, or separate societies, and in these they carry out some very peculiar parts of their organization, particularly a division into *choirs* of children, youths, maidens, unmarried brethren, unmarried sisters, widowers, and widows, each having a separate leader or pastor. Unmarried brethren, unmarried sisters, widowers, and widows, reside in separate houses; married couples in houses of their own. Colonies of Moravians exist in England, America, Holland and other countries, but are most numerous in Germany. The most important *colonies*, however, are perhaps those in the mission-fields. The Brethren early entered on missionary work, and all the prosperity of their church has been evidently connected with their earnest prosecution of it. Their first mission was planted, in 1732, in the island of St. Thomas, in the West Indies; the missionaries who went thither expressing their resolution to become slaves, if necessary, in order to carry out their purpose. A mission to Greenland, which has been eminently successful, and may be said to have made Greenland a Christian country, was commenced in 1733. They have also interesting missions in Labrador and at the cape of Good Hope, and in other heathen countries. The Moravians have at their mission-stations about 70,000 converts from heathenism. One of the most interesting of their stations is at Sarepta, in the government of Saratov, in Russia, by which they are connected with the Tartars and Kalmucks. In all their settlements, the education of the young receives the utmost attention.

The religious services of the Moravians are conducted with great simplicity. They meet for worship daily, in the evening, the service being much like that of a *prayer-meeting* amongst other Christians. They use a litany on the Lord's day, but extemporary prayer is frequent. They admit the use of instrumental music. They maintain the practice of washing the feet, both in choirs and in congregations, before the communion. They meet on the last day of the year, to bring in the New Year with prayer and other exercises of religion. On Easter morning they assemble in the burying-ground to celebrate the resurrection of Christ, and to express their confidence concerning the brethren who have died during the preceding year. The death of a member of the brotherhood is made known in the chief settlements by sound of trumpets, as if for victory; the melody indicating the particular choir to which the deceased belonged. In some of the settlements peculiar dresses are worn by the members of particular choirs.

In the three home provinces (German, English, American) there were in 1881, in all, 10 bishops, nearly 300 presbyters and deacons, and nearly 20,000 communicants. In foreign missions (including one in Bohemia and Moravia) were 3 bishops, 170 missionaries, 1550 native agents, and 27,000 communicants. See histories in German by Gindely (1868) and Goll (1882); in French by Bost (1844, English transl.); and in English by Holmes (1825); see also, Seifferth on the constitution of the church.

MORAVIANS (*ante*), so named because Moravia was at one time their principal seat, existed as a body of Christians—I. From the time of John Huss, about the mid-middle of the 15th c., when they were more commonly called the Bohemian brethren. In 1456 some members of a parish in Prague, wishing for their own personal welfare to escape from the corruption of the national church, withdrew, by permission obtained from the regent of Bohemia through the intervention of their priest, to an estate called Lititz, on the eastern frontier, that had been desolated by war and was thinly inhabited. Their object was not to form a new sect, but to continue the reformation which Huss had commenced, limiting their efforts, however, to the society formed among themselves within the national church, the members of which were pledged to adhere to the Bible as the only rule of faith and practice, to maintain a scriptural discipline, and in administering the Lord's supper to employ the exact words of Christ without attempting any explanation of them. In 1457 they adopted a statement of their principles and committed it to the care and administration of 28 elders. They assumed at first the title of *Brethren and Sisters of the Law of Christ*, afterward shortening it to *The Brethren*. Still later the well-known Latin title *Unitas Fratrum*, Unity of the Brethren, came into use, and is now their official designation. Gregory the patriarch presided over them, and some of the priests of the national church ministered to them. Their influence rapidly extended through Bohemia and Moravia. Their elders made their principles known, and received many earnest inquirers into fellowship. In 1461 they suffered persecution, notwithstanding which they continued to grow. In 1464 three of the elders were intrusted with a special supervision of their affairs, and received written instructions for their guidance. In this document they say, "We are, above all, agreed to continue, through grace, sound in the faith of our Lord Jesus Christ; to be established in the righteousness which is of God, to maintain the bond of love among each other, and to have our hope in the living God. We will show this both in word and deed, assist each other in the spirit of love, live honestly, study to be meek, quiet, humble, sober, and patient, and thus to testify to others that we have in truth a sound faith, genuine love, and a sure and certain hope." To these principles they have ever remained true. They have manifested their faith by their works, and have diligently maintained scriptural discipline. Their confessions of faith have always magnified the importance of practical Christianity, and in their churches they have required evidence of personal piety, not the mere assent to a creed. In separating from the national church and ordaining a ministry for themselves they sought divine guidance by patient waiting, fasting, and prayer, and last of all by the use of the lot. In 1467 three men were appointed, again by lot, to the ministry, who were ordained first by their own presbyters, in accordance with what they believed had been the practice in apostolic times, and secondly as bishops by Waldensian bishops, that they might also conform to the custom of the churches in the age after the apostles, besides gaining thus a ministry that would be universally acknowledged. After this their numbers increased rapidly in all parts of Bohemia and Moravia. Differences of opinion concerning discipline caused them internal trouble, 1480–94; and grievous persecutions, 1468 and 1508, came upon them from without. The national church united with the Roman Catholics to exterminate them by means of imprisonment, spoliation, torture, and death. But again "the blood of the martyrs was the seed of the church." The persecutions came to an end, and the brethren renewed their numbers and their strength. When the reformation in the 16th c. began, they were in a flourishing condition, having churches in 400 parishes with at least 200,000 members, among whom were included some of high rank and influence. They used their own hymn-book, catechism, confession of faith, and printing-presses for multiplying Bibles and evangelical books. They were therefore truly, as they have been called, "reformers before the reformation." Yet, in full accordance with their character, they hailed the new movement with joy, entering into conference first with Luther, and afterward with the Swiss reformers. This fellowship was helpful to all parties. The doctrinal system of the Moravians was improved, and discipline and union among the reformers were promoted. The brethren established themselves in Poland, 1549, during the persecution inflicted on them by Ferdinand I. Large numbers of them, banished from Bohemia, removed to East Prussia, and thence one of them, George Israel, went to Poland, where he preached with great success. In 1557 the Polish churches were received into the union. Rudolph II., 1609, in compliance with the demands of his barons, granted a charter which secured religious liberty in Bohemia and Moravia. An evangelical consistory was formed at Prague in which the brethren as a legally acknowledged church were represented by one of their bishops. In 1619 the Bohemian revolution caused by the accession of Ferdinand II. changed the face of religious affairs, and developed into the Thirty-years war, during which Bohemia and Moravia were brought into subjection to Roman Catholic power. In 1621 the king, having put to death many Protestant nobles, began what was called the anti-reformation. Commissioners, aided by Jesuits and soldiers, went through the country to force the people back to the Roman church. Many laid down their lives; 30,000 families left the country, and the rest of the people were driven into an outward subjection. The Moravians, thus banished from their homes, re-appeared in other lands. About 100 new parishes were organized in Prussia, Hungary, and Poland. They had cherished the hope of returning to their own

countries at the termination of the war. But at the peace of Westphalia these countries were not restored to the enjoyment of religious liberty. Eight years after that peace, their settlement in Poland was broken up by war between that country and Sweden. The members of their council were scattered, and their parishes were transferred to the Reformed church. For more than half a century their visible organization ceased to exist; only its hidden seed in Bohemia and Moravia remained. But their bishop, Amos Comenius, as if prophetically assured of their future re-appearance, published a new edition of their history, doctrines, and discipline; commended them to the care of the English church, and formed plans for preserving their episcopacy by consecrating clergymen of the Reformed church, with which they had been united in Poland.

II. *The renewed Moravian Church.*—In 1722 some of the "hidden seed" was revealed by the escape of several families from Moravia under the lead of Christian David. By invitation of count Zinzendorf they settled on his domain of Berthelsdorf, in Saxony, and within seven years about 300 others having joined them from Bohemia and Moravia, they built a town which they named Herrnhut, "the watch of the Lord," and which was soon strengthened by the coming of religious men from other parts of Germany. Within this colony the Moravian church was formally renewed by the introduction of the ancient discipline which Comenius had reprinted, and in the consecration of a new bishop by the hands of the two surviving bishops among the clergymen of the Reformed church. While the ancient church thus entered on a new life, as many persons of various views united with it from different parts of Germany, and as count Zinzendorf also had some peculiar opinions, the new development differed somewhat from the old. Count Zinzendorf having become the leading bishop, strove, in rebuilding the church, to interfere as little as possible with the national church, in communion with which he had been born. In carrying out his views he established on the continent of Europe, in Great Britain, and America, strictly Moravian settlements, where the vanity and irreligion of the world were to be shut out, a high standard of spiritual life was to be maintained, and only brethren were to hold real estate. These Moravian settlements were designed to be as leaven throughout Christendom. Among them a merely nominal profession of Christianity was not to be known; but all the inhabitants were to be sincere followers of Christ. This ideal was for a long time kept steadily in view, and with very great success. Besides these exclusive settlements they had in Great Britain and America some churches of a more general character. For a time fanaticism and extravagance threatened great injury to their settlements and churches in Europe; but the timely efforts of Zinzendorf and his helpers were successful in checking the evil. Their salutary influence extended far beyond their own bounds. They contributed greatly to increase John Wesley's power; imparted to Schleiermacher the love to Christ which gave character to his whole life; afforded places of refuge for true Christianity during the prevalence of German rationalism; educated in their schools large numbers of young persons belonging to other denominations; started a great home missionary work; and engaged with pre-eminent zeal in establishing missions in heathen lands. There are still 15 exclusively Moravian settlements on the continent of Europe, and four in Great Britain. In these the members are divided into seven classes called *choirs:* the married, the widowed, the unmarried men, the unmarried women, the boys, the girls, and little children. In each village there is a Brethren's house for the unmarried men, who live together and carry on trades; a Sisters' house, where the unmarried women have their homes and are supplied with work suited to them; and a Widows' home, where all of that class are provided, at moderate cost, with all things needed for their comfort, and where the poorest can live respectably. The spiritual affairs are under the superintendence of the Elders' conference, while financial and municipal matters are managed by the board of overseers. Until lately real estate could be held only by Moravians, but changes in this rule are in progress which will probably result in the entire abolition of the exclusive system.

III. *The Moravian Church in America.*—Moravian emigrants went to Georgia in 1735; but five years afterward, when troubles arose between that colony and Spain, they removed to Pennsylvania, where they built the towns of Bethlehem and Nazareth. These and some smaller settlements adopted the exclusive plan and even communism in labor. "The lands were the property of the church, and the farms and various departments of mechanical industry were stocked by it and worked for its benefit. In return the church provided the inhabitants with all the necessaries of life. Those however who had means of their own retained them. There was no common treasury." This system, which was called the "Economy," existed for 20 years, during which time it produced great results. Each member of it was pledged to devote his time and powers in whatever direction they could be best applied for the spread of the gospel. By this means there went forth a succession of missionaries through the colonies and among the Indians, preaching salvation by Christ, while the work at home of farmers and mechanics provided for their support. Though the Economy was of short duration, the exclusive foreign policy was continued 80 years. But toward the middle of the present century it was gradually modified, and has now been set aside. The Unitas Fratrum is divided into three provinces, the German, British, and American, which are independent in local affairs, but form one organization for the control of doctrine, discipline, ritual, and foreign missions. The provincial synods meet at fixed times, and pro-

vide for all matters of administration among themselves. At intervals of ten or twelve years the general synod of the whole body is held at Herrnhut in Saxony. It consists of nine delegates from each province, of delegates from the foreign missions, and of certain *ex officio* members. It elects a board of twelve bishops to oversee the whole church in general matters, and to superintend the foreign missions. At the last meeting of the general synod in 1881 the number of members reported from the American provinces was over 9,560, and of souls connected with the church, 16,491. In the northern provinces they had about 29 regular churches, 65 ministers and many boarding schools designed for young people not connected with the denomination. New church buildings cannot be consecrated till the building expenses have been provided for; and the right of congregations to lay representation in provincial synods, is contingent upon their adequate support of their minister and their church establishment. The northern and southern provinces were united in 1881. At the present time, the American province has about 29 home missions, including 2 among the Indians in Canada and Kansas.

MORA'WA, river in Austria. See MARCH.

MORA WOOD, a dark timber from a Guiana tree, the *dimorphandra mora*, or *moral excelsa* of the order *leguminosæ*. It is brought to Europe for shipbuilding purpose.

MORAY, EARL OF, See MURRAY, *ante*.

MO'RAY FIRTH, and indentation of the German ocean, on the n.e. coast of Scotland. Its n.w. shore is formed by the counties of Ross and Cromarty, and extends from Kessock ferry, opposite Inverness, to Tarbet Ness. Its s.e. shore extends from Inverness to Burghead, in Elginshire. The entrance of the firth between Burghead and Tarbet Ness is 16 m. in width; and from its entrance to Inverness it is 31 m. in extent. The firth is continued westward from Inverness by a branch called Beauly basin.

MORAYSHIRE. See ELGINSHIRE.

MORAZAN', FRANCISCO, 1799–1842; b. in Honduras, his father being of Corsican descent. At an early age he began to be active in the troubled politics of Central America, and when but 25 years old was made secretary-general of Honduras; and soon after, having shown himself both a good soldier and a keen statesman, he was elected governor of the state. At that time the liberal party was in power, but constant insurrections were incited by the reactionary factions. These factions Morazan met with firm military measures, and in 1829 drove them out from the city of Guatemala, a service rewarded by the congress with the title of "saviour of the republic." From this time until 1832 he was commander-in-chief of the forces and intrusted with extraordinary powers. He used his authority in ridding the country of the curse of monasticism, abolished convents and tithes, and had the boldness to expel the archbishop of the diocese and other church dignitaries. In 1832 he repelled an invasion from Mexico headed by Arce, a former president, and consented to accept the presidency, which up to that time he had refused. But he had underrated the power of the church; the prevalence of the cholera gave the priests a pretense to inflame the minds of their most ignorant devotees, mostly Indians, with preposterous tales of poisoning and the "vengeance of heaven." A general rising took place, Morazan was overpowered, and, in 1840, compelled to flee to Chili. In 1842 he went to Costa Rica and was made governor without opposition. Still adhering to the idea of federation of the states of Central America he soon lost his popularity; again a sudden insurrection was incited and Morazan fell a victim, being court-martialed and shot on Sept. 15, the anniversary of the federation in 1823 of the five independent states.

MORBID APPETITES may consist of a desire which is, in character, natural and necessary to the animal economy, but becomes unhealthy when excessive and irresistible. Of this, the hunger which attends marasmus, and the thirst which attends diabetes, may be cited as illustrations. They may consist, further, in a craving for articles or objects not in reality deleterious or detrimental, but which do not constitute the ordinary gratification of the appetite, such as the desire for chalk and lime experienced by chlorotic and hysterical women. They may, thirdly, consist in the longings, often complicated with delusions, felt by pregnant women and others, which are injurious, repugnant to nature, and revolting. Georget gives an instance where a wife coveted the shoulder of her husband, killed him in order to obtain the morsel, and salted the body in order to prolong the hideous cannibalism. In such a case the gross longing may be said to constitute the disease; but there are others in which it is one of many symptoms demonstrating the degradation of the mind under general disease, as when the insane devour garbage, excrement, or swallow grass, hair, stones.—Georget, *Dict. de Médecine;* Feuchtersleben, p. 276.

MORBIHAN, a maritime department in the n.w. of France, formed out of ancient Bretagne. Area, 2,615 sq.m.; pop. '81, 521,614. The coast is much indented, and has a multitude of bays, roadsteads, harbors, and islands. The largest island is Belle isle (q.v.). The department has a somewhat hilly appearance, but towards the sea the land stretches out in rich plains, interrupted, however, by great tracts of heath and marsh. The climate is mild but moist. The soil is not well cultivated, but yields sufficient grain for home consumption. The heaths afford fine pasturage, and support great herds of horned cattle, sheep, and horses. The rearing of bees is a source of very considerable revenue; as also are the river and coast fisheries. The trade in sardines is particularly extensive. The want of wood is so great that the peasants are obliged to

burn dung extensively. The chief mineral is iron, but there are almost no manufactures. Morbihan is divided into the four arrondissements of Vannes, L'Orient, Ploermel, and Pontivy. The chief town is Vannes (q.v.), but the most populous is L'Orient (q.v.).

MORDANTS. See DYEING.

MORDAUNT, CHARLES, Earl of Peterborough, military and naval commander, and one of the most brilliant Englishmen of his time, was the son of John, lord Mordaunt, and was born in 1658, some say 1662. He served as a boy in the navy, and then entered the army. He took part against James II., and was made earl of Monmouth by William III., succeeding afterwards to the earldom of Peterborough, as heir to his uncle. During the war of the Spanish succession the English government determined to send an expedition to Spain. It was placed under the command of Mordaunt, and in June, 1705, he arrived in Lisbon with 5,000 Dutch and English soldiers. After taking on board the archduke Charles of Austria, who claimed the Spanish crown, the armament proceeded to Valencia. Here Mordaunt, with characteristic daring, conceived the idea of making a dash at Madrid, and finishing the war at one blow. He was overruled by the archduke and the prince of Hesse, and compelled to besiege Barcelona, which was defended on one side by the sea, and on the other by the strong fortifications of Monjuich. By a *coup de main* he made himself master of Monjuich. Barcelona fell, and Mordaunt, with a handful of men, entered one of the strongest cities of Europe. He pushed his successes into the interior. Several towns submitted. He marched to Valencia in the depth of winter, and at the head of 1200 men defeated a Spanish force of 4,000. The Spaniards sent a large army into Catalonia, and a French fleet appeared off Barcelona. Mordaunt harassed the enemy's army, and putting himself on board the English squadron, directed a movement which, had it been executed a few hours earlier, would have resulted in the capture of the whole French fleet. The Frenchmen put to sea, and Barcelona was saved. Mordaunt again wished to march towards Madrid, but his plan for gaining possession of the capital was once more rejected by Charles. He accordingly left the army in a fit of pique, and went to Italy. In 1707 he returned to Valencia as a volunteer, and gave excellent advice, which was not followed. He was recalled to England, and from that moment the tide of fortune ran strong against the Austrian cause. Few generals have done so much with means so small, or displayed equal originality or boldness. His fertility and activity of mind were admirably seconded by a most intrepid spirit. His splendid talents, on the other hand, were disfigured by vainglory, and a morbid craving for novelty and excitement. He loved to fly round Europe, and was said to have seen more kings and postilions than any other man of his day. On his return he made common cause with the tories, to spite the duke of Marlborough, and received the garter and other dignities for his services. On the accession of George I. he was appointed commander-in-chief of the naval forces of Great Britain; He died at Lisbon, Oct. 25, 1735. His witty yet affectionate letters to Pope, Swift, Prior, etc., give a fine insight into his private character. See Eliot Warburton's *Memoir of Charles Mordaunt, Earl of Peterborough and Monmouth, with Selections from his Correspondence,* 2 vols. (1853). His character has been sketched by Horace Walpole, in his *Catalogue of Royal and Noble Authors*, and with still greater force and picturesqueness by Macaulay.

MORDECAI, ALFRED, b. N. C., 1800; graduated at West Point in 1823, and remained there the two following years as professor of philosophy, and engineering. In 1855 he was sent by the government to the Crimea as a member of the military commission, and his report was published by congress in 1860. Since 1862 he has been assistant engineer of the Mexico and Pacific railroad. He is the author of several technical works, the chief of which is an *Ordnance Manual.*

MORDVINS, a people in e. Russia, between the Oka and Volga rivers. They belong to the Volgaic division of the Finns. Their number is estimated at 400,000. A grammar of their language was published by Ahlquist at St. Petersburg, 1871.

MORE, HENRY, D.D., 1614–87; b. Grantham, Lincolnshire, Eng.; studied at Eton, where beside his regular studies he spent much time in reading the philosophical works of Aristotle and Julius Scaliger; entered Christ college, Cambridge, at the age of 17, and graduated in 1635. During all his college course he devoted himself with great zeal to philosophy, saying to some one, "I immersed myself over head and ears in the study of philosophy, promising a most wonderful happiness to myself in it." He found no rest to his mind in any system, but became more and more perplexed and skeptical, until he came to the writings of Plato and the Platonic writers, and "discovered the long-looked for treasure in the dreamy pages of Marsilius Ficinus, Plotinus and Trismegistus." In 1639 he took the degree of master of arts, and became tutor to several persons of distinction. He declined many important offers in the church, preferring a quiet life at Cambridge and the study of philosophy even to the honors of a bishopic at £1500 a year. He resigned the rectory of Ingoldsby in 1642, declined the mastership of his own college in 1654, and though he accepted a prebend in the church of Gloucester in 1675, he soon resigned it. In 1640 he published *Psychozoia or the First part of the Song of the Soul, containing a Christiano-Platonical display of life.* This was reprinted in 1647, and with some additional pieces under the title of the *Philosophical Poems.* His next work was *Conjectura Cabalistica,* and the *Philosophiæ Teutonicæ Censura,* at the request of Lady Conway,

a noted disciple of William Penn. He secured her friendship, and received from her a legacy of £400, which he devoted to private charity. In 1671 he published *Enchiridium Metaphysicum*, in which he inveighed against Cartesianism. His other principal works are *Enchiridion Ethicum Metaphysicum; The Mystery of Iniquity; A Key to the Revelation; An Apology for Descartes; The Immortality of the Soul; Enthusiasmus Triumphatus; The Mystery of Godliness*, which for 20 years had a great sale. £300 were left by an admirer of his works to have some of More's pieces translated into Latin, which led the author to publish all his works in Latin in 3 folio vols. in 1679. His last work *Medela Mundi* he did not live to finish. The greater number of his works appeared in English under the title of *A Collection of several Philosophical Writings*, folio. *The Life of the Learned and Pious Dr. Henry More* was written by the Rev. Richard Ward. Though a mystical philosopher, he was a man of great intellectual power, profound learning, and rare excellence of character. He was one of the first fellows of the royal society, and was a correspondent of Descartes.

MORE, Hannah, the daughter of a village schoolmaster, near Bristol, was b. in 1745. She wrote verse at an early age; and in 1773, she published a pastoral drama entitled *The Search after Happiness;* and the year after, her tragedy of *Regulus*. Under the idea that she was possessed of dramatic talent, she was introduced to Garrick, and through him became acquainted with Dr. Johnson, Burke, and sir Joshua Reynolds. Deeply impressed with the importance of religion, she gradually resigned her ambition to shine as a writer for the stage, and after the publication of her *Sacred Dramas*, she retired to the country, and busied herself with the composition of works of a more serious and practical cast, the best remembered of which are, *Cœlebs in Search of a Wife*, and *The Shepherd of Salisbury Plain*. She died at Clifton, on Sept. 7, 1833. Her *Memoirs and Correspondence* were published in the following year, in 4 volumes.

MORE, Sir Thomas, lord chancellor, and one of England's worthiest sons, was b. in Milk street, London, in 1478, son of sir John More, justice of the queen's bench. He was educated at St. Anthony's school, Threadneedle street; and in his fifteenth year was placed in the house of cardinal Morton, archbishop of Canterbury, who used to say of him: "This child here waiting at the table, whosoever shall live to see it, will prove a marvelous man." Dean Colet, too, was wont to say: "There was but one wit in England, and that was young Thomas More." In 1497 More went to Oxford, where he made the friendship of Erasmus. He then applied himself to the law, and studied first at New Inn, and afterwards at Lincoln's Inn. He was appointed reader at Furnival's Inn, where he lectured for three years. At the accession of Henry VIII., his professional practice was considerable, and he also held the office of judge of the Sheriff's court in the city—his income from these sources being equivalent to £4,000 or £5,000 of our present money. He went on several missions abroad for the king, and in 1516 was made a privy-councilor. His public life now began. He became so great a favorite with Henry VIII., that, in the words of Erasmus, "the king would scarcely ever suffer the philosopher to quit him." Henry visited him uninvited at Chelsea, and walked with him by the hour in his garden, "holding his arm about his neck." Yet More had a true insight into Henry's character, for being congratulated on the king's favor by his son-in-law, Roper, he replied: "If my head would win him a castle in France, when there was war between us, it should not fail to go." More is the first person in British history distinguished by the faculty of public speaking, and remarkable for the successful employment of it in parliament against a lavish grant of money to the crown. Being elected speaker of the house of commons in 1523, he vindicated the ancient liberties and privileges of the house against cardinal Wolsey, who rather feared than liked him. In 1529, when the prosecution was opened against Wolsey, the king delivered the great seal to More at Greenwich, constituting him lord chancellor, a dignity that had generally been held by ecclesiastics, and had never yet been filled by a common lawyer. When he was seated in his court of chancery, his father, sir John More, who was nearly ninety, was the oldest judge of the King's bench. It was a beautiful spectacle to "see the son ask the blessing of the father every day upon his knees, before he sat upon his own seat." Unlike the haughty Wolsey, whom no suitor would approach without offerings, More sat daily in an open hall, that he might receive in person the petitions of the poor. He dispatched the causes so speedily and diligently, that on asking for the next, he was told that none remained. Henry in vain endeavored to obtain More's authority for his divorce with Catharine of Aragon, and his marriage with Anne Boleyn, upon which he had set his heart. As soon as the progress of the marriage was so far advanced that the active co-operation of a chancellor was required, More obtained leave to resign the great seal. When the king "by no gentleness could win him," his favor turned to fury. More refused to take an oath which pledged him to the lawfulness of the king's marriage with Anne Boleyn. He was committed to the Tower, where he remained thirteen months. On May 6, 1535, he was brought to trial at Westminster. It has been truly said that "no such culprit had stood at any European bar for a thousand years." He was convicted by the most flagrant perjury and injustice, and sentenced to the savage punishment for high treason. He suffered death in the Tower, July 6, 1535. In the words of Addison: "The innocent mirth which had been so conspicuous in his life did not forsake him to the last." When he laid his head on the block, he desired the execu-

tioner to wait until he had removed his beard, "for that had never offended his highness." His head was placed on London bridge, but was taken down and preserved by his favorite daughter, the admirable Margaret Roper, the story of whose tenderness and devotion will live as long as the English language endures. His *Utopia* is the conception of an imaginary commonwealth, in which opinions are expressed of great boldness and originality, and especially favorable to freedom of inquiry, even in religion. He, however, wrote against the Lutherans, and corrected the MS. of Henry's answer to Luther. The terseness and liveliness of his sayings, his sweet temper and affectionate disposition, his blameless life, his learning and probity, combine to make a union of perfect simplicity with moral and intellectual greatness, which will for ever endear his memory to his countrymen of every sect and party.

MORE'A, the name borne by the ancient Peloponnesus (q.v.) since the middle ages, if not from as early a period as the 4th century. It is usually said to be derived from *morus*, a mulberry—the outline of the peninsula bearing a resemblance to the leaf of that tree; others, however, such as Fallmerayer, trace it back to the Slavic word *more*, the sea, which nearly encircles the Morea. The Morea forms the most southern part of the kingdom of Greece, and is divided into the nomarchies of Argolis, Corinth, Laconia, Messenia, Arcadia, Achaia, and Elis.

Overrun by the Goths and Vandals, it became a prey, in the second half of the 8th c., to bands of Slavic invaders, who found it wasted by war and pestilence. Gradually, however, these barbarians were subdued and Grecianized by the Byzantine emperors. Nevertheless, the numerous names of places, rivers, etc., in the Morea of Slavic origin, prove how firmly they had rooted themselves, and that the Moreotes are anything but pure Greeks. In 1207 the peninsula was conquered by French knights, and Achaia was formed into a principality with all the feudal institutions of the west. After 1261 the Byzantine emperor, Michael VIII. Palæologus, reconquered part of the country; but the principality of Achaia remained in the family of Villehardouin till 1346, when the male line became extinct. Various claimants now arose, and much strife and confusion ensued. At length, in 1460, the greater portion of the Morea fell into the hands of the Turks, who retained possession of it down to the period of the Greek revolution, except from 1687 to 1715, when it was held by the Venetians. The long struggle between the Turks and Venetians diminished the population so much that in 1719 it had only 200,000 inhabitants, and the plagues of 1756 and 1782 even reduced it to half this number. After the French revolution, however, it began to increase; at the outbreak of the war of independence, in 1827, it had reached 300,000, of whom only one-sixth were Turks; and in 1880 it was 745,000.

MOREAU, Jean Victor, the greatest general of the French republic, except Bonaparte, was born Aug. 11, 1763, at Morlaix, in Bretagne; was the son of an advocate, and was sent to study law at Rennes. He took the side of the revolution, was chosen to command the battalion of volunteers from Rennes, served under Dumouriez in 1793, and displayed such military talent, that in 1794 he was made a general of division. His father was put to death by the guillotine under the reign of terror, and Moreau hesitated for a moment, but resolved that he could not withdraw from the service of his country. When Pichegru fell under suspicion, the directory appointed Moreau, in the spring of 1796, to the chief command on the Rhine and Moselle. He crossed the Rhine at Kehl, defeated Latour at Rastadt, and the archduke Charles at Ettlingen, and drove the Austrians back to the Danube. But, owing to errors in the plan of the campaign, against which he had in vain remonstrated with the directory, Moreau found himself in danger of being cut off from the Rhine, and was obliged to make a desperate effort to regain that river, which he accomplished, notwithstanding great difficulties, by a march of forty days. This retreat established his reputation for generalship more than all his previous victories.

A suspicion of participation in the plots of Pichegru led to his being deprived of his command, after the *coup d'état* of 18th Fructidor. In the following year he succeeded Schérer in the command of the army in Italy, when it was hard pressed by the Russians and Austrians, 25,000 men being opposed to 80,000. By a retreat conducted with consummate skill, and in course of which he even gained victories, he saved the French army from destruction. The directory, nevertheless, deprived him of the chief command, and gave it to Joubert. But Moreau remained with the army, and aided that young general to the utmost; and after his death at Novi, again assumed the command, and conducted the defeated troops to France. The noble disinterestedness of Moreau's character, his military talent, and his political moderation, induced the party which overthrew the directory, to offer him the dictatorship of France, which he declined, and lent his assistance to Bonaparte on 18th Brumaire. Receiving the command of the army of the Rhine, Moreau gained victory after victory over the Austrians in the campaign of 1800, and at last won the great and decisive battle of Hohenlinden (q.v.). A strong feeling of mutual distrust now arose between Moreau and Bonaparte, who sought in vain to win him to himself; and Moreau's country-seat, to which he retired, became the gathering-place of the discontented. Bonaparte surrounded him with spies, and ere long he was accused of participation in the plot of Cadoudal (q.v.) and Pichegru against the life of the first consul. He was arrested, brought to trial, and found guilty on 10th June,

1804, although the evidence against him was utterly insufficient. But Bonaparte could not venture upon a sentence of death, and a sentence of two years' imprisonment was therefore pronounced, which was commuted into banishment, and Moreau went to America, where he settled in New Jersey. Regarding with great dissatisfaction the whole of Bonaparte's further career, he thought it his duty to France to give his aid to the allies in the campaign of 1813, and leaving the United States in the company of a Russian agent, he landed at Gothenburg, had an interview with the crown prince of Sweden, the former gen. Bernadotte, and accompanied the emperor of Russia and the king of Prussia in the march against Dresden, where, as he stood with the emperor Alexander on a height at Raecknitz, on Aug. 27, a French cannon-ball broke both his legs. Amputation was performed, but he died at Laun in Bohemia, Sept. 2, 1813.

MOREAU DE SAINT MÉRY, MÉDÉRÍC LOUIS ÉLIE, 1750–1819; b. in the isle of Martinique; educated in Paris; commenced life as an advocate, and not long after returned to his native island to practice his profession; amassed a fortune, and was charged by the French government to prepare a civil code for the French islands, which was published under the title, *Lois et constitutions des colonies francaises de l'Amerique, de* 1550 *à* 1785. Named president of the electors of Paris in July, 1789; member of the constituent assembly for Martinique in 1790; a refugee to the United States, after the dominance of the Jacobins in Paris; there became a bookseller; was called to Bonaparte's council of state in 1800; administrator of the states of Parma, Plaisance, and Guastalla, in 1802, and there fell into disgrace for lack of energy against a militia revolt. In 1806 he was granted an audience by Napoleon, and said to him: "Sire, I do not ask to be recompensed for my probity, I ask only for its toleration." He became very poor afterward, until 1817, when Louis XVIII. granted him a handsome pension. His published works are *Description de la partie espagnole de Saint Dominique* and *Description de la partie française de Saint Dominique*, both published in Philadelphia in 1796–97–98.

MORE'CAMBEBAY, an inlet of the Irish sea, on the n.w. coast of England, separates the main portion of Lancashire from the detached portion of Furness. It is about 10 m. in average breadth, and is 16 m. in length. It receives the Kent, the Keer, and the Lune. The depth of water in the bay is never great except in the channels of the rivers; and when the tide is out, the water entirely withdraws for the time, and there is a road, although a dangerous one, across the sands from the vicinity of Lancaster into Furness.

MOREEN. See MOIRE.

MOREHEAD, JAMES T., 1797–1854; b. Ky.; educated at the Transylvania university, and admitted to the bar. He served a number of terms in the legislature and was elected lieutentant-governor in 1832. He was governor 1834–36, and U. S. senator from Kentucky 1841–47. He published in 1846 a work on *Practice and Proceedings at Law.*

MOREHOUSE, a parish in n. Louisiana, adjoining Arkansas, bounded on the s.e. by the Bœuf Bayou river, on the w. by the Ouachita river, and drained by the Bœuf bayou and Bartholomew bayou; pop. '80, 14,206—14,111 of American birth, 10.662 colored. The surface is undulating, and heavily wooded with oak, pine, cypress, and other trees. The soil is rich; the principal productions are Indian corn, cotton, and sweet-potatoes. Capital, Bastrop.

MOREL, *Morchella,* a genus of fungi, of the division *hymenomyctes,* having a fistular stalk, and a roundish or conical *pileus,* the upper surface of which is divided into an irregular net-work of cells or pits, and bears the *hymenium.* They grow on the ground, and have a more or less agreeable smell and taste. Some of them are reckoned among esculent fungi, of which the best-known is the COMMON MOREL (*M. esculenta*), a fungus rare in Britain, but common in many parts of the middle and south of Europe. Its stalk is only about an inch high, and it has a roundish, oval, oblong, or conical, yellowish or brown pileus. It is nutritious, and not difficult of digestion; but is chiefly used in sauces and gravies, on account of its pleasant flavor. It is used either fresh or dried, and is often brought to market in a dried state. It grows in lawns, and among fallen leaves in the thinner parts of woods where the soil is light, and makes its appearance in spring. It makes excellent catchup. In Germany the morel is highly prized, and as it very often springs up when part of a forest has been burned, the forests of Germany were often destroyed for its sake, till this practice was restrained by severe penalties. Its cultivation has not been attempted, although probably it would not be difficult.—A very similar species is *M. patula,* which is used in the same way; as is also the BOHEMIAN MOREL (*M. Bohemica*), which has a stem 4 to 8 in. high, and thimble-shaped, obtuse, white-margined pileus, with longish narrow pits of many various forms; abundant in Bohemia, and, when dried in a baker's oven, a considerable article of export. The name morel (*morchel*) is extended in Germany to some of the edible species of *helvella* (q.v.).

MORELL', JOHN D., b. England, 1815; studied philosophy, upon which he has written a number of books. His *Historical and Critical View of the Speculative Philosophy of Europe* appeared in 1846; *Philosophy of Religion,* 1849; and *Elements of Pscychology,* 1853.

MORE'LIA, or VALLADOLID, a t. of Mexico, capital of the state of Michoacan, in a fine valley, surrounded by high mountains, 125 m. w.n.w. of Mexico. There is a magnificent aqueduct for the supply of water. It was the birthplace of Iturbide, the short-lived emperor of Mexico. Pop. 25,000.

MOREL'LA (anc. *Castra Ælia*, the winter-quarters of Sertorius), a t. and important fortress of Spain, in the province of Castellon, about 80 m. n. of Valencia. Morella was the chief stronghold of Cabrera, who scaled the castle by ropes furnished by a partisan within, on the night of Jan. 25, 1838. It was retaken in 1840 by Espartero, after a brave defense. There are some interesting Roman and Moorish antiquities. Pop. 6,300.

MORE'LOS Y PARON, José Maria, 1780–1815; b. in New Mexico; curate of a village in Valladolid. The insurrection against Spanish rule was headed by Hidalgo, and to this movement Morelos joined himself in 1810, and received a commission as capt.gen. of the s.w. provinces. His first great exploit was the capture of Acapulco, where a large body of regular troops was surprised and routed by a few hundred insurgents, mostly negroes. This victory was preceded and followed by many gallant and well-planned movements; but when in 1813 he determined on the attack of Valladolid, contrary to the advice of his next in command, Matamoros (q.v.), he undertook a task beyond his strength. There, after a fierce contest, his forces were routed, and after sustaining for some time an unequal struggle, he was captured, tried, and put to death.

MORESQUE. See Arabesque, Grotesque.

MORE'TO Y CABA'NA, Agustin, 1600–69; b. Spain. Little is known of his life. He wrote many plays, some religious, as *The Most Fortunate Brothers;* or heroic, like *The Brave Justiciary of Castile;* but the majority, "comedies of cloak and sword," in the old Spanish manner. His best drama, *Disdain met with Disdain*, is founded on Lope's *Miracles of Contempt*, and was in its turn imitated by Molière in the *Princesse d'Elide.* The Don Diego of his play of that name has become the Spanish type and synonym for a coxcomb.

MO'RETON BAY, on the e. coast of Queensland, Australia, is formed inside the islands of Moreton and Stradbroke, the former 23 m., and the latter 35 m. in length, and both about 5 m. in greatest breadth. It is 65 m. in length (lat. 27° to 27° 55′ s.) by 23 m. in greatest breadth. Its shores are rich in soil, and admirably adapted for agriculture. Its appearance is rendered picturesque and beautiful by the numerous islets, some of them capable of profitable cultivation, with which it is dotted over. Into this bay 5 navigable rivers, the Arrowsmith, Logan, Brisbane, Pine, and Caboolture, pour their waters. The entrance at the n. end is practicable at all times for vessels of the largest size; the entrance between Moreton and Stradbroke is narrow, and less safe.

MORETON-BAY CHESTNUT, *Castanospermum Australe*, a tree of the natural order *leguminosæ*, sub-order *papilionaceæ*, a native of Queensland, Australia. It attains a height of 70 to 100 ft., has wide-spreading branches, pinnate leaves, and large racemes of beautiful red and yellow flowers. The pods are 6 or 7 in. in length, and the seeds are in size and quality somewhat like chestnuts.

MOREY FORGERY, an event of the presidential campaign of 1880, when James A. Garfield, the republican candidate for president, was charged with having written a letter favoring Chinese immigration in the interest of a supply of cheap laborers. The letter, purporting to be addressed to "H. L. Morey, Lynn, Mass.," was made public in a New York paper, Oct. 20, 1880; and on the 22d what purported to be a fac-simile in lithograph or photo-engraving process from the original letter, was published in the same paper. On Oct. 23 Mr. Garfield, in two letters from Ohio, which were promptly made public, denounced the letter to Morey as "a bold forgery both in its language and sentiment;" and denied that he had ever heard of the existence of such a person as H. L. Morey. The managers of the democratic campaign refused credence to Mr. Garfield's denial, and circulated an immense number of copies of the original "letter;" producing a profound impression throughout the country, particularly on the Pacific coast. There is reason to believe that the "letter," now conceded to have been a forgery by some hand not yet known beyond question, turned the vote of California in favor of the democratic candidate for the presidency.

MORGAGNI, Giovanni Battista, 1682–1771; b. Italy; studied medicine at Bologna, and physics and comparative anatomy at Padua and Venice. In 1706 he published *Adversaria Anatomica*, a treatise of marked originality, and 6 years later he was appointed professor of the theory of physic at Padua. In 1719 he published complete his collection of *Epistolæ Anatomicæ*, containing his observations for many years. His great work, *De Sedibus et Causis Morborum per Anatomen Indagatis*, which appeared in 1761, is still an authority on pathology. Morgagni was a man of vast learning in other branches, and in medicine he performed much the same service for pathology that Haller did for physiology.

MORGAN, a co. in n. Alabama, s. of the Tennessee river; 720 sq.m.; pop.'80, 16,428—16,339 of American birth. The surface is irregular and mountainous. The soil in most portions is rich, and good crops of Indian corn, cotton, sweet potatoes, and oats are grown. Considerable molasses is made from sorghum. A portion is watered by Flint river. It is on the Memphis and Charleston, and South and North Alabama railroads. Co. seat, Somerville.

MORGAN, a co. in n. central Georgia, drained by the Appalache and Oconee rivers and their branches; 450 sq.m.; pop. '80, 14,034—9,788 colored; intersected by the Georgia

railroad. The surface is level or undulating, partly covered with forests and very fertile. Cotton, corn, and sweet potatoes are the staples. Limestone and granite are found; there are several saw-mills and tanneries.

MORGAN, a co. in w. Illinois, s.e. of the Illinois river; 550 sq.m.; pop. '80, 31,514—27,683 of American birth. It is mostly prairie, with occasional small tracts of timber. The soil is deep and rich, and produces immense quantities of corn, the annual production of which amounts to millions of bushels. Wheat and oats are also grown in abundance. There are large numbers of sheep, and wool-growing is cultivated with success. The chief manufacture is carriages; next in importance are agricultural tools, and machinery, flour, harnesses, and furniture. The Wabash, Chicago and Alton, Rock Island, Rockford and Peoria, Pekin and Jacksonville railroads pass through it. Co. seat, Jacksonville.

MORGAN, a co. in central Indiana; 453 sq.m.; pop. '80, 18,899—18,602 of American birth. The surface is level in the n., but more irregular in the south. The soil is rich, and produces immense quantities of Indian corn, besides wheat, oats, tobacco, and potatoes. There are large numbers of cattle, and wool is exported. The White river and Mill and White Lick creeks flow through it. There is a heavy growth of timber. The Indianapolis and Vincennes, and Fairland, Frankland and Martinsville railroads cross it. Co. seat, Martinsville.

MORGAN, a co. in n.e. Kentucky, having a range of the Alleghany mountains for its e. boundary, drained by the Licking river, forming a part of its n.w. border; 330 sq.m.; pop. '80, 8,455—8,451 of American birth, 33 colored. Its surface is rough and hilly, a large proportion covered with forests of beech, cedar, hemlock, laurel, holly, etc. Its mineral products are iron, bituminous coal, alum and copperas, and oil springs appear in some sections. Its valleys are fertile, producing grain, potatoes, tobacco, wool, and dairy products. Some attention is paid to stock raising. Co. seat, West Liberty.

MORGAN, a co. in central Missouri; 600 sq.m.; pop. '80, 10,134—9,399 of American birth. The surface is uneven and hilly, and the soil fertile. The chief products are Indian corn, wheat, and oats. Pork and cattle are also staples. Bituminous coal, lead, and limestone are found. The county is drained by the Osage and Lamine river. There are extensive forests of elm, wild cherry, oak, hickory, and ash. The Missouri Pacific railroad runs along the n. border. Co. seat, Versailles.

MORGAN, a co. in s.e. Ohio, on both sides of the Muskingum river; 360 sq.m.; pop. '80, 20,074—341 foreign. The surface is uneven and diversified. The soil is fertile, and the principal crops are corn, wheat, tobacco, oats, and potatoes. The growing of wool is an important industry. There are extensive deposits of salt. There are a number of flour mills, tanneries, currying shops, salt manufactories, and carriage shops. Co. seat, McConnellsville.

MORGAN, a co. in n.e. Tennessee, watered by Emery and Obie's rivers; 640 sq.m.; pop. '80, 5,156—286 colored. The surface is irregular and mountainous, belonging to the Cumberland table-land. Much of it is covered with a heavy growth of oak, pine, and chestnut. There are extensive deposits of bituminous coal. The staples are Indian corn, oats, grass, tobacco, and butter. It is on the Cincinnati Southern railroad. Co. seat, Wartburg.

MORGAN, a co. in n.e. Utah; 600 sq.m.; pop. '80, 9,266—8,243 of American birth. The surface is irregular and mountainous. The soil is not largely cultivated, but produces some barley and wheat. Gold is found in paying quantities, and coal and iron are known to exist. The Union Pacific railroad passes through it. Co. seat, Morgan.

MORGAN, a co. in West Va., on the Baltimore and Ohio railroad and the Potomac river; 375 sq.m.; pop. '80, 5,777. Large deposits of coal and iron are found within its boundaries. Co. seat, Bath.

MORGAN, Charles W., 1790–1853; b. Va.; entered the navy at an early age, and was one of the officers of the ship *Constitution* at the time of the engagement with the men-of-war *Guerrière* and *Java* in 1812, when he rendered such conspicuous service that the legislature of Virginia, in recognition of it, presented to him a sword. From 1841 to 1843 he commanded the Mediterranean squadron. He was a nephew of Daniel Morgan, a brig.gen. in the revolutionary war.

MORGAN, Daniel, 1737–1802; b. N. J. When 17 years old he emigrated to Virginia, where he worked as a farmer for some years. Next, he shared in the perils of Braddock's expedition against the Indians, probably as a wagoner, and received a wound in his neck and face that greatly disfigured him. It is stated, also, that during this campaign he was unjustly punished by 500 lashes for some fancied indignity to an officer. At the breaking out of the revolution he was given the command of 75 men enlisted in his neighborhood, with whom he rode to Boston, a distance of 600 m., to join the main army, where he was detached in the expedition against Quebec. In the attack on that city he distinguished himself by bravery and courage, but he was finally taken prisoner. After being exchanged he was appointed col. of a Virginia regiment, and further promotion rapidly followed. In 1780 he received a brig.gen.'s commission; was attached to the army in the south; and won the memorable victory at Cowpens over Tarleton, for

which congress awarded him a gold medal. Shortly afterwards ill-health obliged him to retire to his farm, and he did not become conspicuous again until the "whisky insurrection" in Pennsylvania in 1794, when he commanded the Virginia militia against it. After this he was a member of congress from Virginia one term. Died at Winchester, Va.

MORGAN, Edwin Dennison, b. Mass., 1811. He received a common school education, and when about 17 entered a business firm at Hartford, Conn., and in 1831 became a partner. In 1836 he started a wholesale business in the city of New York, and soon acquired a large fortune. He served as a state senator 1849–53; was afterwards chairman of the republican committee, and in 1859 was elected governor of New York and served two terms, 1859-63. His administration was marked by the introduction of several local reforms, the reduction of the state debt, and improved management of the canals; he also displayed great vigor in assisting the general government at the outbreak of the civil war, and was given the rank of maj.gen. of volunteers. At the end of his term of office he was elected U. S. senator. In 1864 President Lincoln offered him the position of secretary of the treasury, but the honor was declined. After that time Mr. M. remained in New York, conducting his extensive business, but taking great interest in politics. In 1876 he was again the republican candidate for governor, but was defeated by Lucius Robinson. He gave large sums to the building fund of Union theological seminary of New York. He d. 1883.

MORGAN, George Washington, b. Penn., 1820; after serving in the Texan war for independence in 1836, he entered West Point, but left without graduating, and took up the study of law. On the outbreak of the Mexican war, he raised a regiment of Ohio volunteers, attached to the command of gen. Taylor. In 1847 he was made col. in the regular army, and served under gen. Scott in command of the 15th U. S. infantry. For gallantry at Contreras and Churubusco, he was brevetted brig.gen. He was appointed U. S. consul at Marseilles in 1855, and minister to Portugal in 1858. In the war of the rebellion, he commanded divisions in the army of the Ohio and the army of the Tennessee, but resigned, on account of ill health, in 1863. He was a member of congress from Ohio from 1871 to 1875.

MORGAN, Sir Henry John, about 1635–90; Welsh descent; trained to the sea and for some time served under Mansfield, at whose death he assumed command of a fleet of twelve ships, and as an English buccaneer preyed on the commerce of the West Indies. He carried Portobello by assault, in 1669 retired to Jamaica with a large fortune, but in 1670 again took command of a large fleet and ravaged the coast of Nicaragua. The next year he marched upon the city of Panama, and with less than 1500 men captured and burned the city. Peace having been made, he visited England, was knighted by Charles II., and appointed governor of Jamaica, where he died.

MORGAN, James D., b. Mass. 1810; in boyhood shipped in the *Beverley*, and barely escaped with his life, as the crew mutinied and the ship was burned. The boat in which he escaped reached the South American coast, and Morgan endured many privations and hardships in returning home. He served as captain in the Mexican war; when the rebellion broke out was commissioned lieut.col. of the 7th Illinois volunteers, distinguished himself at New Madrid and Corinth, and in 1862 was made a brig.gen , and served in the Tennessee campaign, afterwards commanding a division of the 14th corps in Sherman's march to the sea.

MORGAN, John H., 1826–64; b. Ala.; settled in the vicinity of Lexington, Ky., in 1830 He was engaged in the war with Mexico, holding a commission of 1st lieut. in Marshall's cavalry, and was present at the battle of Buena Vista. He was afterwards in business in Lexington, manufacturing bagging, but in 1861 attached himself to Buckner's army, being in command of the Lexington rifles, which he afterwards left, and commanded a squadron of cavalry at the battle of Shiloh He however, left the regular confederate service and engaged in guerrilla warfare on his own account, with a band of adventurers, who made the name of "Morgan's raiders" remembered with terror wherever they appeared. The extraordinary celerity and success of his movements gave him a high and peculiar military reputation, seriously modified by the utterly irregular character of his modes of warfare. Following close after the union armies, he destroyed military stores, burned railroad trains, tore up tracks, demolished bridges, and generally harassed and despoiled the enemy after a fashion of his own. He was even sufficiently enterprising and ingenious to keep a telegraph-operator with him in his movements, by whose aid he was enabled to spread false intelligence concerning them, and also obtain constant information with regard to the attempts which were being made to interfere with his rapid operations. He was finally captured, with nearly his whole command, while making a bold raid through Kentucky, Indiana, and Ohio. He was imprisoned in the Ohio penitentiary, but succeeded in escaping, and fled into Tennessee, where he soon after organized another raid, which proved to be his last. He was betrayed and captured by federal cavalry at a farm-house, where he was stopping, in Greenville, Tenn., and killed while seeking to escape.

MORGAN, John T. See page 883.

MORGAN, Lady (Sydney), was the daughter of a theatrical manager, named Owenson, who settled in Dublin. It is usually stated that she was born in 1786, but as she refuses to tell the date of her birth, "because dates are so cold, false, and erroneous," the

reader of her autobiography will do well to add about ten years to her age. Her father fell into pecuniary difficulties, and the clever, bold, and lively young woman resolved to support the fortunes of the family, first as governess, and then as author. She wrote *The Wild Irish Girl* in 1806. A lady novelist was then rare, and Irish subjects were less hackneyed than they have since become. Sydney Owenson obtained a footing in the household of the marquis of Abercorn, in whose establishment her future husband, Dr. Morgan, held the post of private physician. The lord lieutenant was persuaded to make a knight of Dr. Morgan, and the newly wedded pair set up for themselves in Dublin. Here she wrote the *O'Donnel.* The opening of the continent in 1814 attracted the Morgans to Paris. Lady Morgan obtained admission into the highest society, corresponded with several celebrities, and wrote a work on *France,* which was eagerly received and vehemently praised and censured by critics of different political opinions. In 1818 the Morgans went to Italy—the wife to sketch manners, scenery, and society, while sir Charles was to contribute chapters on politics, science, and education. Lady Morgan was received with great hospitality by the Italian nobility and the foreign visitors at Rome. Her *Italy* appeared in 1821, and proved one of the most successful and remunerative of her works. In 1824 the Morgans came to London, and in 1825 lady Morgan began to keep a diary, which contains some amusing bits of literary, fashionable, and political gossip. Her reputation as an authoress became obscured, but she continued to the end of her career to assume the twofold character of the lady of fashion and the woman of genius. She succeeded in obtaining from the Whig government a pension of £300 a year, in acknowledgment of her literary merits, and partly, also, in recognition of the unjust and virulent attacks to which she had been subjected for having, in her earlier works, exposed the wrongs of her native country. She died in 1859, having continued busy with her pen and her tongue to the last; and leaving behind a great mass of correspondence of little intrinsic value and interest, which, with a memoir, her autobiography, and diary, was published in 1862, in 2 vols. Her descriptions of high life have much raciness and vigor, and her Irish sketches—the famous "Jug-day," in *The O'Briens and the O'Flahertys,* deserving special mention—are perhaps the best account of that rackety, humorous, sentimental existence which was at once the charm and bane of Ireland, and which has but lately passed away.

MORGAN, Lewis Henry, b. N. Y., 1818; educated at Union college, and admitted to the bar. He began the practice of law at Rochester, in 1844, and retired in 1864. He is one of the first authorities on ethnology and anthropology. In 1851 appeared his *League of the Iroquois,* a study of the customs and institutions of the six nations. His investigations were particularly directed to the systems of family relationship prevailing among savage tribes; and in pursuit of his inquiries, he addressed letters to missionaries and U. S. consuls residing in the vicinity of barbarous nations. By this means he collected a large body of information, which is contained in his *Systems of Consanguinity and Affinity of the Human Family,* which was published by the Smithsonian institution in 1870. Some of the theories advanced in this work have met with considerable opposition from students of anthropology; as, for instance, from Mr. McLennan in his well-known book on *Primitive Marriage.* But the value of Mr. Morgan's researches as to facts has been universally recognized. In 1868 he published a work on *The American Beaver,* containing the results of his personal observations near lake Superior. Mr. Morgan has been a member of both branches of the N. Y. legislature.

MORGAN, Sir Thomas Charles, 1783–1843, b. England; educated at Eton and Cambridge. He took a medical degree in 1809, and began the practice of his profession in London. He was knighted in 1811, and soon afterwards established himself in Ireland, where, after giving up his practice, he devoted himself to literature and to the promotion of Roman Catholic emancipation. He published *Sketches of the Philosophy of Life; The Philosophy of Morals;* and with lady Morgan, *The Book Without a Name.*

MORGAN, William. See Anti-Masons.

MORGAN, William F., s.t.d., b. in 1818 at Hartford, Conn.; graduated at Union college, N. Y., and at the Episcopal theological seminary in New York. For more than twenty-five years he has been rector of St. Thomas's church in New York, holding high place among the clergy of his denomination as a writer and preacher. A collection of his sermons has been published.

MORGANAT'IC MARRIAGE (Goth. *morgjan,* to curtail, limit), sometimes called *left-handed marriage,* a lower sort of matrimonial union, which, as a civil engagement, is completely binding, but fails to confer on the wife the title or fortune of her husband, and on the children the full status of legitimacy or right of succession. The members of the German princely houses have for centuries been in the practice of entering into marriages of this kind with their inferiors in rank. Out of this usage has gradually sprung a code of matrimonial law, by which the union of princes with persons of lower rank, in other than morganatic form, involves serious consequences, especially towards the lady. The penality of death was actually enforced in the case of the beautiful and unfortunate Agnes Bernauer (q.v.). In the 16th and 17th centuries, a fashion began among German princes of taking a morganatic wife in addition to one who enjoyed the complete matrimonial status—landgrave Philip of Hesse setting the example, with a very qualified dis-

approbation on the part of the leading Reformers. An energetic attempt was made in the first half of the last c. by Anton Ulrich, duke of Saxe-Meiningen, to upset the established practice, and obtain for his morganatic wife the rank of duchess, and for her children the right of succession. In deference to the united opposition of the whole princedom of Germany, the emperor refused the duke's suit, declaring that there could be no marriage in princely families without "ebenbürtigkeit," or equality of birth. In the present c. morganatic marriages are by no means on the decline among the German reigning houses—one of the best known and most remarkable instances being the union of the late Archduke John, the "reichsverweser" of 1848, with the daughter of the postmaster of Aussee, in Styria, afterwards created countess of Meran. Morganatic marriages are recognized not only among the princely families, but among the higher aristocracy of the empire; and in Prussia even the "niedere adel," or inferior gentry, may contract unions of this kind. A sort of left-handed or "hand-fasted" marriage was recognized in early times in the Highlands of Scotland, and Ireland: the hand-fasted bride could be put away, and a fresh union formed, with the full status of matrimony. Unlike the case of German morganatic marriages, the issue were often accounted legitimate, even to the prejudice of the children of the more regular union that followed. The Royal Marriage act, 12 Geo. III. c. 11, reduces to a position somewhat like that of morganatic unions every marriage in the royal family of Great Britain not previously approved by the sovereign under the great seal, provided the prince entering into it is under 25, and every such marriage of a prince above 25 which is disapproved by parliament.

MORGAN CITY (formerly Brashear City, La.) See page 883.

MORGAR'TEN, a mountain slope on the e. margin of lake Egeri, in the canton of Zug, Switzerland, has acquired a world-wide celebrity as the scene of a great victory won by the Swiss forest cantons over the Austrians Nov. 15, 1315. The Swiss, who had command both of the narrow pass which wound between Morgarten hill and the lake, and of the adjoining heights, numbered only 1400 men, while the Austrians amounted to 15,000, and were led by duke Leopold, brother of the German emperor. When the Austrian troops had fairly entered the pass, those of the Swiss posted on the rocks above hurled down great masses of stone, which threw the enemy's cavalry into confusion, besides killing immense numbers of them. Their comrades who held the pass, taking advantage of the disorder, now charged the Austrians repeatedly, and utterly routed them. Only a few escaped, among whom was duke Leopold himself.

MORGENSTERN, Christian, 1805–67; b. Germany; studied painting in the school of Bendisen. He afterwards studied at the Copenhagen academy of fine arts, and in 1830 took up his residence in Munich, where his first exhibited picture was "The Heath of Lüneburg." He exhibited a picture on the same subject at Paris many years afterwards. He was a good landscape painter, and also an etcher of merit. His best pictures are studies from the scenery of Heligoland.

MORGHEN, Raphael Sanzio Cavaliere, a famous engraver, was b. at Florence, June 19, 1758. His first instructor in the art of engraving was his father, who, according to some, was a German or the son of a German. The indications of talent that he gave were such as to induce his father to place him under Volpato at Rome. His progress then became very marked. Raphael's celebrated figures in the Vatican of "Poetry" and "Theology" were engraved by him in 1781; and he afterwards produced a succession of engravings of a very high class from many of the masterpieces of art: amongst these may be enumerated his prints from Raphael's "Madonna della Seggiola;" the "Madonna del Sacco," by Andrea del Sarto; the "Transfiguration," by Raphael; the "Duke of Moncado," by Vandyke; and by his burin, Da Vinci's "Last Supper," notwithstanding its decay, has been rendered with such consummate skill, as to lessen the regret felt for the evanescent condition of the original work. He accepted an invitation from the grand duke to reside at Florence, with a pension of 400 scudi, and a free residence, under condition of keeping a public school; and received marked attentions from the emperor Napoleon, to whom he dedicated his engraving from the "Transfiguration." Morghen died at Florence on April 8, 1833. He had married a daughter of Volpato's in 1781. His life, with a portrait, and a catalogue of his works, was published by his pupil Niccolo Palmarino. From this work it appears that he has engraved 73 portraits, 47 religious and 44 historical and mythological pieces, 24 views and landscapes, and 13 vignettes, crests, etc.—201 in all. The works of Morghen will always hold a very prominent place in the history of engraving. About the middle of last century, Strange had added a new feature to the art, by introducing, in a remarkable way, what is technically called by engravers "color," or the art of producing by management and variety of line a texture or quality that compensates to some extent for the want of the actual colors in a picture. This influenced the style of Volpato, Cunego, and other Italian engravers of the period, who imitated, though with no very great success, the brilliancy produced by Strange. Morghen, however, went far beyond these Italian engravers, for in his works he united much that was good in the engravings of Strange with a more correct and a purer style of drawing, and thus brought out in a very high degree all the important qualities for which those masterpieces he so skillfully rendered are distinguished.

MORGUE, a French word, denoting the inner wicket of a prison, at which persons accused or condemned are kept for some time, in order that the jailers and turnkeys may examine them at their leisure, so as to be able to recognize them when occasion requires. Hence the application of the word to a certain building (*La Morgue*) in the "city" (*La Cité*) of Paris, situated on the *Quai du Marché neuf*, where the dead bodies of persons unknown, found either in the river (Seine) or in the streets, are exposed to public view for three days. The corpses are put under a glass case, on a sloping slab of black marble. They are wholly naked, except across the middle, which is covered with a piece of leather. The clothes are hung on the wall above. When a corpse is recognized it is handed over to the relatives or friends of the deceased, on payment of costs and dues—otherwise it is interred at the expense of the city. The number of bodies yearly exposed in the *Morgue* is about 300, of which five-sixth are those of males.

MORGUE (*ante*). Morgues have been established in the principal American cities; in New York in 1866, in Boston in 1851, in Brooklyn in 1870, in Chicago in 1872, in St. Louis in 1874.

MORIAH, Mount. See Jerusalem, *ante*.

MORIAH: a tp. in Essex co. N. Y.; including Port Henry vill. Pop. '80, 7,379.

MORI, the family name of the daimios or feudal princes of the provinces of Suwo and Nagato (or Choshiu) in Japan. During the 15th and 16th centuries, the Mori family ruled 11 provinces, but after being humbled by Taiko they held in fief only the provinces of Suwo and Nagato; and as such, were guardians of the straits of Shimonose'ki (see Shimonoseki). Nagato was long the seat of Dutch learning, and many students were sent to Europe and America, though under the ban of the Yedo authorities. The Mori family and their retainers were very active in the revolution of 1868, and took the field against the Tycoon, armed with American rifles. Among the many able men from this province were Kido, Hirosawa, Inouye, and other high officials and statesmen. Three cadet families formerly held fiefs under the feudal system. The Mori crest is a transverse bar under which are three balls.

MORI, Arinori, a Japanese statesman, b. in Satsuma about 1848. He was one of the first natives to escape from Japan and the repressive measures of the tycoon. Reaching England, he spent two years in study, and returning to Japan took a seat in the national legislature, proposing the abolition of the ancient custom of wearing two swords. This measure, though at first angrily condemned, was finally adopted. Mori was the first Japanese ever chosen to fill a permanent diplomatic post abroad. This was at Washington, D. C., as *chargé d'affaires*, in 1871. While here he composed a work on *Life and Resources in America*, which was translated and circulated in Japan. He also collected in a pamphlet the views of leading American educators on the subject of education for Japan, and petitioned his government in an able memorial on behalf of liberty in religious matters. Recalled in 1873, he was soon after sent as minister plenipotentiary to Peking, and assisted to secure the Japanese treaty with Corea, Feb. 27, 1876. In 1879 he was appointed minister plenipotentiary to the court of Great Britain, a post which he still holds. In 1874 he married a Japanese lady of Shidzuoka, according to the western principle of equality of goods and legal status—an innovation of great social influence on the position of woman in Japan. Latterly he has written his name Maury.

MÓRIER, James, 1780–1848; b. England; traveled extensively in the east, and described his journey in his *Travels through Persia, Armenia, and Asia Minor*. He afterwards resided for six years in Persia, as private secretary to the British minister, and became familiar with the character and customs of the inhabitants—a knowledge which he soon made use of in novels of eastern life. The first and most popular of these, *The Adventures of Hajji Babá*, appeared in 1824. It was followed by *Zohrab*, and *Ayesha, the Maid of Kars*.

MÖRIKE, Eduard, b. Würtemberg, 1802; educated at the Stuttgart gymnasium, and Tübingen, where he studied for the ministry. He was for a time settled over a church, but was compelled to leave the ministry on account of ill-health, and became a teacher in Stuttgart. Mörike published a number of novels and poems, and translations of Theocritus and Anacreon His *Poems* appeared in 1838; *An Idyll of Lake Constance*, in 1846; and *Foor Tales*, in 1856. He d. 1875.

MORILLO, Pablo, 1777–1838; b. Spain; count of Cartagena and marquis of Fuentes; entered the Spanish navy in 1793. During the war carried on by the Spaniards against Napoleon he raised a guerrilla corps, at the head of which he soon acquired reputation and became a lieut.gen. In 1815 he was placed in command of 12,000 men and sent to South America to conquer the insurgent provinces of Venezuela and New Granada; but after many alternations of fortune his army was routed and he was recalled. He then joined the court party and was believed to be one of the authors of an insurrection of the guards in July, 1822. After this he went over to the patriots, obtained command of an army corps, changed back again and submitted to the French intervention. His former treason, however, was not pardoned by the restored king, and he died in exile in France.

MORIN, Arthur Jules, b. Paris, 1795; educated in the polytechnic school, and in 1839 made professor of industrial mechanics in the *conservatoire des arts et métiers* of Paris. In 1843 he became member of the academy of sciences; in 1850 was appointed

to aid in organizing an agricultural institute for France; in 1851 commissioner to the exposition of London; the following year director of the *conservatoire,* which place he retained till 1873; in 1855 was president of the executive committee of the Paris exposition, and in 1862 president of the society of civil engineers. Prof. M. occupied the unique position of receiving all the military grades up to gen. of division without leaving the duties of his directorship of the conservatory of arts and trades. He was the inventor of a dynamometer-crank by which the force of living motors is measured and the laws of momentum of falling bodies determined. His scientific publications alone form a library, beginning with 1831 and ending with 1871, and have been a fertile source of information to scientists and machinists of all nations. He d. 1880.

MO'RION, an iron or steel head-piece worn by a man-at-arms in the days when armor was used. It was distinguished from the helmets of the knights and esquires in having neither visor nor beaver. Under the Norman laws every yeoman between certain ages was bound to keep his morion ready for service.

MORISON, JOHN HOPKINS, b. N. H., 1808; studied at Phillips Exeter academy, and graduated at Harvard college in 1835; was settled over the Unitarian society in New Bedford, Mass., and in 1846 in Milton, where he still preaches. He published *Life of Jeremiah Smith; Disquisition and Notes on the Gospel of Matthew.* He is now one of the editors of the *Unitarian Review,* and has been editor of the *Monthly Religious Magazine;* also a frequent contributor to the *Christian Examiner* and other Unitarian journals. He received the degree of D.D. from Harvard college. He is regarded as an evangelical Unitarian.

MORISON, ROBERT, M.D., one of the most eminent botanists of the 17th c., was a native of Aberdeen, and having borne arms as a royalist in the civil wars, retired to France about 1650, and became superintendent of the garden formed at Blois by Gaston, duke of Orleans. After the restoration he was appointed by Charles II. one of his physicians, and "botanist royal," and became professor of botany at Oxford. He died in 1683. His great work is *Plantarum Historia Universalis Oxoniensis* (2 vols., 1676–99). He also wrote on umbelliferous plants.

MORISO NIANISM, a name freely used to designate the distinctive tenets of the evangelical union (q.v.), but never accepted by that religious body. The system of doctrine so designated is fully enunciated in an authoritative document entitled *Doctrinal Declaration,* which was issued by the evangelical union conference of 1858—not as a fixed creed, but as a testimony to their distinctive faith. Being a recoil from the dominant Calvinism of Scotland, it is of the Arminian type, but without any latitudinarian savor. The charge of Pelagianism often urged against it is indignantly repudiated by evangelical unionists, and, with reference to some modern aspects of Calvinism, is by them spiritedly retorted. It is a form of doctrine, in fact, which very nearly corresponds to that type of evangelical Arminianism which obtains among the Wesleyans. Like that, it originated in an element of revival; and now, after the lapse of a generation, these same tenets are largely insisted on by revival preachers of the orthodox bodies at the present day. This coincidence is explained by the felt need, in all efforts to bring men to religious decision, to give prominence to the universalities of gospel grace, the duty of immediate faith, and the importance of peace with God as a subjective condition of the Christian life. It was these, and especially the doctrine that Christ died as an atonement in the same plenary sense for all men, which led to the separation, in 1841, of the rev. James Morison of Kilmarnock (now Dr. Morison of Glasgow) from the United Secession church, and of other three ministers at subsequent synods, and to the formation by them of the evangelical union in May, 1843. A theological academy was at the same time instituted, presided over by Dr. Morison, at which from 20 to 30 students annually receive training for the ministry. Many of these have gone to Englaad, and some have obtained good positions among the nonconformists there. The evangelical union now embraces about fourscore ministers and churches, all independent in polity, but many having ruling elders. In brief, the most distinctive doctrine of evangelical unionists is that which they prominently exhibit as the three great universalities of gospel grace—namely, the divine Father loves all, the divine Saviour died for all, the divine Spirit strives for the salvation of all. Believing in the entire freedom of the human will, they hold predestination to be conditional. On such cardinal doctrines as the trinity, atonement, justification, and the like, they symbolize with other bodies known as evangelical.

MORLAIX, a sea-port of France, in the department of Finistère, 45 m. n.n.e. of Quimper. Vessels of 40 tons can reach the quays of the town. Pop. '81, 13,788.

MORLAKS, the name of a maritime people occupying the coast of Dalmatia on the Adriatic, and a part of Austro-Hungary. They are of the Slavic race; but are a distinct people, mostly sea-faring, and are drawn upon to man the Austrian navy. The territory occupied by them is called Morlacca, and the strait which separates it from the islands of Pago, Arbe, and Veglia, is known as the strait of Morlacca.

MORLEY, HENRY, b. England, 1822; educated in Germany and at King's college, London; after which he taught a successful school near Liverpool. In 1847 he published some papers in respect to the public health, which attracted the attention of Charles

Dickens, and led to an engagement as assistant editor of *Household Words*, a position that he retained six years. Then he became one of the editors of the London *Examiner* and a lecturer at King's college. During these years he also published *The Dream of the Lily Bell*, tales and poems; *Sunrise in Italy*, poems; *A Defense of Ignorance;* lives of Bernard Palissy, Gerome Cardan, and Henry Cornelius Agrippa; and a collection of his contributions to *Household Words*, under the title of *Gossip and Memoirs of Bartholomew Fair*. Since 1865 he has been professor of English literature in University college, London. His later works include *English Writers before Chaucer*, 2 vols., 1864–67; *A First Sketch of English Literature*, 1873; *English Literature in the Reign of Victoria*, 1881, etc.

MORLEY, John, b. England, 1838; graduated at Oxford in 1859, and during several years afterward edited a journal called the *Literary Gazette*, and contributed to *The Saturday Review*. In 1867 he published an historical study of Edmund Burke, which introduced him to the general public, and as editor of *The Fortnightly Review*, 1868–82, he became well known as a political and religious radical. He unsuccessfully contested the borough of Blackburn in 1869, and the city of Westminster, in 1880; but in 1883 was returned to parliament by the borough of Newcastle-upon-Tyne. He has published *The Limits of the Historical Method; Critical Miscellanies;* elaborate critical studies of *Voltaire; Didérot;* and *Rosseau;* a *Life of Richard Cobden*, etc.

MORLEY, Thomas, d. 1604; b. England; graduated at Oxford, and was appointed, after studying music with William Birde, a "gentleman of queen Elizabeth's chapel," in 1592. He was familiar with the works of the Italian composers, and many of his compositions are madrigals and canzonets in the Italian manner. He also wrote a number of anthems. He edited a collection of madrigals by different English composers, one of whom was the father of John Milton, in honor of Elizabeth, who appears in it as Oriana. The title of this book is *The Triumphs of Oriana*. Morley was also the author of a work called *A Plaine and Easy Introduction to Practical Musicke*.

MORMONS,* or, as they call themselves, The Church of Jesus Christ of Latter-Day Saints, are a religious sect founded by a native of the United States named Joseph Smith. Smith was the son of a farmer, and was born in the town of Sharon, Windsor co., Vt., Dec. 23, 1805. When he had reached the age of 10, his parents removed to Palmyra, in the state of New York, and four years later, to the town of Manchester, about 6 m. off. The reputation of the family is said to have been of the worst kind; we are told that they avoided honest labor, were intemperate, untruthful, and suspected of sheep-stealing and other offenses. These accusations are generally denied by Mormons, but Smith himself partly admitted them, affirming that he "had never done anything so bad as was reported of king David, the man according to God's own heart." Nevertheless, a rude sensual religiosity appears to have been mixed up with his more carnal conduct. There is the most satisfactory evidence—that of his enemies—to show that from an early period he was regarded as a visionary and a fanatic. This fact is of the utmost importance as affording a clew to his *real* character, and an explanation of that otherwise unaccountable tenacity of purpose and moral heroism displayed in the midst of fierce persecution. A *mere* impostor—i.e., a person who did not, in some sense or other, partly believe in his own mission, but who, on the contrary, felt that he was simply the liar and cheat that people called him—would have broken down under such a tempest of opposition and hate as Smith's preaching excited.

"When about fourteen years of age," Smith says, "I began to reflect upon the importance of being prepared for a future state." He then describes how he went from one religious denomination to another, but could find nothing satisfactory—nothing but "a great clash in religious sentiment." Then he began to withdraw into secret places, to spend hours in prayer and meditation, and to receive angelic visits. The second of these happened on the evening of Sept. 21, 1823, when it seemed as though the house was filled with "consuming fire." In a moment a "personage" stood before him, "with a countenance like lightning," and "visible to the extremities of the body," who "proclaimed himself to be an angel of God." He informed Smith of various important particulars, as, "that his sins were forgiven, and his prayers heard; that the covenant which God made with ancient Israel was at hand to be fulfilled; that the preparatory work for the second coming of the Messiah was speedily to commence; that the time was at hand for the Gospel to be preached in its power and fullness to all the nations; and that Smith was chosen to be an instrument in the hands of God to bring about some of his purposes in this glorious dispensation." Besides all this, the angel gave him, by way of appendix, "a brief sketch of the origin, progress, civilization, laws, and governments" of the aboriginal inhabitants of America—"of their righteousness and iniquity; and the blessings of God being finally withdrawn from them." He was also informed where some plates were deposited, containing an abridgment of the records of the ancient prophets that had existed on the American continent. The angel appeared to Smith thrice that night, and afterwards paid him many visits. He told him where the records were deposited, "on the west side of a hill, not far from the top, about four miles from Palmyra, in the county of Ontario, and near the mail-road, which leads thence to the little town of Manchester." He advised him to go and view them, which Smith did; but the prophet was not yet holy enough to obtain possession of them.

* The origin of this name will appear in the sequel.

At length, after due disciplinary probation, the angel of the Lord, on Sept. 22, 1827, placed in Smith's hands the wonderful records. They were engraven on plates nearly 8 in. long by 7 wide, a little thinner than ordinary tin, and bound together by three rings running through the whole. The volume was altogether about 6 in. in thickness, a part of which was sealed. The characters, letters, or hieroglyphics upon the unsealed part were small, and beautifully engraved. They represented an unknown language called the "Reformed Egyptian." Along with the records was found a curious instrument, called by Smith "urim and thummim," consisting of two transparent stones, set in the rim on a bow fastened to a breastplate. By means of these stone spectacles, God enabled him to understand and translate the ancient records into such humble English as the "prophet" (who had received almost no school-education, and could read with difficulty) was master of. The records contain the primitive history of America, from its first settlement by a colony that came from the tower of Babel, at the confusion of languages, to the beginning of the 5th c. of the Christian era. These primitive colonists were called Jaredites; they were a wicked and bloody race, and finally, like the Kilkenny cats, mutually destroyed each other, millions being slaughtered in the final conflicts. Silence again settled down upon America. But a new race came directly from Jerusalem about 600 B.C. These consisted of Lehi and his wife; his four sons, Laman, Lemuel, Sam, and Nephi, together with their four wives; two "sons of Ishmael," and their two wives; Zoram, a servant, and his wife; in all, 16 men and women. They are supposed to have landed on the coast of Chili. After the death of Lehi, quarrels broke out among the brothers. The Lord had appointed Nephi to be the ruler of the new race of colonists but his elder brothers would not hear of it; as a punishment for which, they and all their posterity were condemned to have dark skins, and "to become an idle people, full of mischief and subtlety, which did seek in the wilderness for beasts of prey." They are the ancestors of the American Indians, who are thus, according to Smith's records, simply *bad* Hebrews. The descendants both of Nephi and of his rebellious brothers, increased and multiplied, but were almost continually at war with each other. In the time of Nephi the second an awful earthquake announced the Crucifixion. Three days afterward Christ himself appeared out of heaven; showed the Nephites his wounded side and the print of the nails; instructed them for forty days in the truths of Christianity; healed the sick, blessed children, administered the sacrament, and planted churches, with apostles, prophets, pastors, teachers, and evangelists—the same order, the same priesthood, the same ordinances, gifts, powers, and blessings as were enjoyed on the eastern continent. Hostilities, however, between the Nephites and their dark-skinned brethren continued to rage as fiercely as ever; gradually the purity of their faith declined; and finally, in 384 A.D., a decisive conflict took place at the hill Cumorah, in western New York, where the Christian Nephites were nearly annihilated; miracles now ceased, and unbelief gradually became supreme. Shortly before this, however, a prophet called MORMON had been commissioned by God to write an abridgment of all their prophecies, histories, etc., and to hide it in the earth, till God should see fit to bring it forth, and "unite it with the Bible for the accomplishment of his purposes in the last days." This is the famous BOOK OF MORMON, believed by the followers of Smith (hence called MORMONS and MORMONITES) to be of equal authority with the Jewish and Christian Scriptures, and to form an indispensable supplement to them, containing God's revelations to the new, as the others to the old world. In 420 A.D. they were finally sealed up where Smith found them, by Moroni, one of the few survivors of the battle of Cumorah.

The way in which Smith translated was as follows: he sat behind a blanket hung across the room to keep the sacred records from profane eyes, and read off by the help of his "urim and thummim," to one Oliver Cowdery, who wrote down what the invisible "prophet" gave as a translation—Smith himself being, as he confesses, but a "poor writer." A farmer, of the name of Martin Harris, supplied Smith with the necessary funds to get the work printed. The *Book of Mormon* finally appeared before the world in 1830, with the names of Oliver Cowdery, Martin Harris, and David Whitmer appended to a statement that an angel of God had come down from heaven and shown them the original plates. This was immediately followed up by the testimony of eight other witnesses, among whom were Smith's own father and two brothers (suspected, however, it must not be forgotten, of being addicted to sheep-stealing and other nefarious practices), who affirmed that "Joseph Smith, junior," had shown them the mysterious plates. These, however, are the only persons who have been so privileged. No other human being has ever seen them. Like Macpherson's Ossianic MSS., they have never been forthcoming, however loudly demanded, and of late years all knowledge of them has become traditional.

Attention was soon drawn to the newly published work, and a controversy sprung up regarding its real authorship. Evidence was brought forward by the opponents of Smith to show that, with the exception of certain illiterate and ungrammatical interpolations, bearing on religious matters, the so-called *Book of Mormon* was really borrowed or stolen nearly *verbatim* from a MS. romance written by a quondam clergyman, named Solomon Spalding, who died in 1816. It is unnecessary to go over the arguments *pro* and *con*. Suffice it to say, that *anti*-Mormons generally think them conclusive; while the "saints" consider the whole story of Spalding's MS. romance a scandalous fabrica-

tion. About 1829 Smith became acquainted with one Sidney Rigdon, originally a compositor and preacher, but who by this time had begun to promulgate a species of incipient Mormonism, and had managed to found a little sect of his own. It is conjectured by the opponents of Mormonism that Rigdon (into whose hands Spalding's romance is supposed to have fallen for some time) gave it to his new associate to further his purposes, and that the latter—in whose soul there may have been (according to our theory of his character) some rude and gross religious notions and feelings—devised the ungrammatical interpolations. This theory acquires some probability from the fact that these religious passages do not refer to old-world faiths and the practices of an ancient ritual, but to quite modern questions, such, we are told, as were rife in the villages of western New York about 1830. Calvinism, Universalism, Methodism, Millenarianism, Roman Catholicism, are discussed, if not in name, yet in reality. Infant baptism is condemned; so, strange to say, are polygamy and freemasonry.

Undeterred, nevertheless, by exposure, ridicule, and hostility, Smith and his associates persevered in preaching their "doctrine," which was a new Americanized phase of millenarianism. They declared that the millennium was close at hand, that the Indians were soon to be converted, and that the New Jerusalem—the final gathering-place of the saints—was to be somewhere in the heart of the American continent. The "prophet's" house "was frequently beset by mobs and evil-designing persons; several times he was shot at, and very narrowly escaped;" but his fearless courage continued to bring him disciples; and on April 6, 1830, the *Church of Jesus Christ of Latter-day Saints* was first organized in the town of Manchester, N. Y. Smith was fiercely attacked by the leaders and preachers of the other religious denominations, but he kept his ground stubbornly, argued pretty well, and when argument failed, had recourse to a style of zealous prophetic asseveration, which is generally irresistible with weak and ignorant people. If the orthodox preachers, however, could not baffle him in speech, they knew how to inflame their hearers with the most ferocious animosity against the new sect; and in Jan., 1831, Smith and his followers considered it prudent to remove to a distant part of the country. They established themselves at Kirtland, in Ohio, which was to be the seat of the New Jerusalem. They now made immense progress. Their missionaries were full of zeal (none more so, however, than Smith himself), converts were made in great numbers, and churches were established in the states of Ohio, Pennsylvania, New York, Indiana, Illinois, etc. Still the eyes of the new sect turned westward—to the region of the great prairies, where they might be allowed to work out their system in peace and freedom. In the autumn of 1831 a colony was established in Jackson co., Mo., which a "revelation" given to Smith assured the saints was "the land of promise and the place for the city of Zion." Land was largely bought; preaching was vigorously carried on, a printing-press was established, a monthly periodical, *The Morning and Evening Star*, and a weekly newspaper, *The Upper Missouri Advertiser*, were started to propagate the doctrines of the new sect; everywhere was visible a spirit of industry, sobriety, order, and cleanliness. It is only fair to the Mormons to state these things. Account for it how we may, they were, in many important respects, morally, socially, and industrially, far in advance of their neighbors. When Smith returned to Kirtland, he set up a mill, a store, and a bank, and continued his propagandist labors with great success, but not without savage persecution; thus, for example, on the night of Mar. 22, 1832, a mob of Methodists, Baptists, Campbellites, and other miscellaneous zealots, broke into the prophet's house, tore him from his wife's arms, hurried him into an adjoining meadow, and tarred and feathered him! Sidney Rigdon was similarly handled, and rendered temporarily insane. Smith, however, undaunted by this brutal treatment, preached next day with his "flesh all scarified and defaced," and proved the folly of persecution by baptizing three new converts in the afternoon. Meanwhile, the brethren in Missouri continued to prosper, but this very circumstance deepened the animosity towards them of all who were not Mormons. Whispers also began to be spread about their indulging in a community of wives. The rumor was not true, but it probably originated in Rigdon's theory of the "spiritual wife," which Smith at first denounced, but afterwards accepted, and thereafter commenced "sealing wives" to himself in some mysterious way that Gentiles cannot yet fathom. The first step towards polygamy—a doctrine not yet revealed, however (in fact, *contrary* to the "revealed" doctrine on the subject), materially helped to inflame the hostility of the impulsive and unscrupulous backwoodsmen. Secret societies (according to Smith, composed "of the basest of men") were formed to expel the Mormons from Missouri; their periodicals were stopped, their printing-press confiscated, their bishops tarred and feathered, and numberless other outrages were committed. Finally, the hapless "saints" were compelled to flee across the Missouri river, and men, women, and children had to encamp in the open wilderness on a winter-night in 1833. They subsequently settled in Clay co., in the same state, where they remained upwards of three years. In July, 1834, they were visited by the "prophet" himself, accompanied by 100 persons, mostly young men, and nearly all priests, deacons, teachers, and officers of the church. During a brief residence of one week among them, he accomplished much in the way of vigorous organization; next year, 1835, a further step was taken in the development of a hierarchy by the institution of a body of apostles—twelve in number—who were sent out to preach the new doctrines among the Gentiles. One of these twelve was the famous Brigham Young, who had become a convert about the close

of 1832, and had soon shown himself to be a man of wonderful sagacity and force of character. He was ordered down east among the Yankees, and made numerous converts even among this acute people. In 1837 Orson Hyde and Heber C. Kimball were dispatched as missionaries to England, where they received large accessions to their numbers, especially from the masses in the great manufacturing and commercial towns, Manchester, Liverpool, Leeds, Birmingham, Glasgow, and, above all, from the mining districts of South Wales, where Mormonism, in some places, almost competed for popularity with Methodism itself. Since then they have extended their strange evangelization to the East Indies, Australia, the islands of the Pacific, Egypt, Palestine, Turkey, and almost every country on the continent of Europe.

About the close of 1837 or the beginning of 1838, the bank at Kirtland stopped payment, and proceedings were taken against the prophet and others for swindling. Luckily, just at this moment, he received a "revelation" to depart into Missouri, which he instantly obeyed, with all the more alacrity that internal disorders had painfully manifested themselves in the new colony. These were at last healed; but the conflict between the saints and the other Missourians became fiereer, more envenomed, more sanguinary than ever, assuming, in fact, almost the proportions of a civil war. The prophet and Rigdon were thrown into prison, and finally, towards the close of 1838, the whole body of saints, about 15,000, quitted Missouri, and took refuge in Illinois. Here they obtained a grant of land in the vicinity of the little town of Commerce, a name which the Mormons, in obedience to a "revelation" given to Smith, changed to Nauvoo, or the city of beauty. The country was a mere wilderness when the Mormons settled in it: it soon began to rejoice and blossom as the rose. Lieut. Gunnison (a most intelligent and impartial writer) is forced by facts to be eloquent in praise of Mormon industry, and gives us a perfeetly enehanting picture of the new colony. The legislature of Illinois granted a charter to Nauvoo; a body of Mormon militia was formed, under the name of the Nauvoo legion, of which the prophet was appointed eommander; he was also appointed mayor of the city, and was thus supreme in all matters civil and military, as well as religious. But the doctrine of "sealing wives" once more roused the wrath of the neighborhood, and serious disturbances took place, the ultimate result of which was that the prophet and his brother Hyram were thrown into prison at Carthage. After a short time it began to be rumored that the governor of the state was desirous of letting the two Smiths escape, whereupon a band of "roughs," about 200 in number, broke into the jail, June 27, 1844, and shot them. Disastrous as this termination of his career was to Smith himself, there cannot be the shadow of a doubt that it was a most fortunate thing for the system which he founded. "The blood of the martyrs is the seed of the church." A halo of solemn and tender glory now encircles the memory of one who stood greatly in need of this spiritual transfiguration. It may here be stated that it eannot be shown that Smith was a polygamist, in our sense of the word. Years after his death, Brigham Young produced a paper which he said was a copy of a "revelation" made to Joseph at Nauvoo, commanding him to take as many wives as God should give him. But it was not till Aug. 29, 1852, at a public meeting held in the Salt Lake City, that the "revelation" was formally received.

Smith's death created great agitation and confusion among his followers. Sidney Rigdon and others aspired to succeed him, but the council of the twelve apostles unanimously elected Brigham Young, and events have shown the wisdom of their choice. The legislature of Illinois having revoked in 1845 the charter given to the city of Nauvoo, and the hostility of their neighbors not having in the least abated, the saints resolved to emigrate far beyond the boundaries of civilization, and to seek a new home amid the solitudes of the Rocky mountains, where they might pass their lives in unmolested peace. Explorers were sent out to examine the country, and brought back a favorable report of the Great Salt Lake valley. See GREAT SALT LAKE, SALT LAKE CITY, and UTAH. In Feb., 1846, the first emigrants crossed the ice-bound Mississippi, settled for a year in Iowa, and then marched under the strictest diseipline across the great wildernesses. Agricultural operations were commenced almost the instant they arrived at the shores of the Salt lake. The cheerfulness, intelligence, and zeal exhibited on all sides, were truly admirable. The world has never seen swifter, more active, more glad-hearted colonists than these singular "saints." It would be unfair to shut our eyes to such facts. In judging Mormonism, we must keep them constantly in view, to prevent us from forming mere abstract and theoretical decisions, which will not in the least affeet the future of Mormonism. Brigham Young arrived in the valley July 24, 1847, and the main body of the Mormons in the autumn of 1848. The Salt Lake City was soon founded, an emigration fund established, and settlers poured in from all parts of Europe and America; and perhaps a greater amount of physieal comfort was enjoyed here than in any other part of the world. In 1850 the government of the United States admitted the region occupied by the Mormons into the union as a territory, under the name of UTAH, and Brigham Young was appointed governor by president Fillmore. District judges were also appointed by the federal government, but these were looked upon with great suspicion and mistrust by the saints, who finally drove them out of the country in 1851. Brigham Young was now suspended from his office of governor, and col. Steptoe of the U. S. army was appointed his successor. He arrived in Utah in 1854, but found it prudent after some time to withdraw from the country. During the next two years the collisions

between the U. S. officers and the saints became more and more frequent, and in the spring of 1856 the whole of the former were forced to flee from the territory. A new governor, Alfred Cumming, was appointed by the authorities at Washington in 1857 and also a new superintendent of Indian affairs; besides a force of 2,500 men was sent to enforce obedience to the laws of the United States. The saints attacked their supply trains, and compelled the enemy to winter at some distance from the Salt lake. In the early part of next year negotiations were entered into between the contending parties; the Mormons submitted to the federal authority, and the federal troops were allowed to encamp on the western side of lake Utah, about 40 m. from Salt Lake City, where they remained till 1860, when they withdrew. After the close of the civil war, the United States seemed determined to insist on its authority. A federal governor was again appointed, and polygamy was declared in 1871 to be a criminal practice contrary to the laws of the United States; Brigham Young was even arrested. One of the most notable events in the recent history of the Mormons took place in the year of Brigham Young's death (1877). John D. Lee, a Mormon bishop, was brought to trial and executed for his share in a crime till then uninvestigated. In 1857 a party of Mormons and Indians, under Lee's command, assaulted a train of 150 non-Mormon emigrants at Mountain Meadows, near Utah, and massacred every soul of them. The complicity of the leaders of the church was not proved, but Lee had been clearly the immediate instigator of the deed.

Hierarchical Organization.—Mormonism is a pure theocracy; its priesthood, who rule in matters temporal and ecclesiastical, are divided into various orders. The highest is the *first presidency*, composed of three persons, who are the successors of Peter, James, and John in the Gospel church. Of these, even Brigham Young was nominally only *primus inter pares*. The first presidency is elected by the body of the church, and possesses supreme authority. The second office in point of dignity is that of *patriarch*, held at present by the nephew of Joseph Smith, whose chief duty is to administer blessings. Then follows the council of "the twelve," whose functions are of great practical importance. They ordain all other officers, elders, priests, teachers, and deacons; they baptize, administer the sacraments, and take the lead in all meetings. Next come the *seventies* (of whom there are many). They are under the direction of the "twelve apostles"—and are the great propagandists, missionaries, and preachers of the body. The fifth order is that of *high-priests*, composed usually of men advanced in years. Their duty is to officiate in all the offices of the church when there are no higher authorities present. After these come the *bishops*, who are "overseers" of the church chiefly in secular matters, attending to the registration of births, marriages, and deaths, the support of "literary concerns" (such as newspapers and magazines), house-visiting, the settlement of private grievances, and the care of the poor. Indeed, according to Dixon (*New America*, vol. i., p. 260), "a bishop's main function is to see that no man in his ward, in his county, is in want of food and raiment." The duties of the *elders* are not very precise, they are charged with the conduct of meetings, and exercise a general surveillance over the *priests*, who correspond to the "fixed ministry" of other sects, i.e., they preach, exhort, and expound the Scriptures. The lowest orders are the *teachers* and *deacons;* the former are simply assistants to the priests, elders, and bishops, and act as catechists; the latter are church-collectors, treasurers, etc.—The whole priesthood is divided into two classes, the Melchisedek and the Aaronic. To the first belong the offices of apostle, seventy, patriarch, high-priest, and elder; to the second, those of bishop, priest, teacher, and deacon. The latter can be held only by "literal descendants of Aaron," who are pointed out by special revelation.

Doctrine.—The saints are almost incredibly materialistic in their doctrines. Their godhead is formed on Buddhistic principles. While professing to believe in the trinity, they explain that God was once a man, who has, however, so advanced in intelligence and power that he may now be called (comparatively speaking) perfect, infinite, etc., but that he has still the form and figure of a man; he has even "legs," as is evident (says Mr. Pratt, "the leading scholar of the Mormon church") from his appearance to Abraham, though he has this advantage over his creatures, that "he can move up or down through the air without using them." Christ is the offspring of the "material" union, on the plains of Palestine, of God and the virgin Mary—the latter being duly married after betrothal by the angel Gabriel. Yet he is believed to have had a previous existence, to have even made the universe out of "unformed chaotic matter as old as God," and his worship is enjoined as Lord of all. The Paraclete is vaguely described, but is also material. It would appear, however, that there is an older trinity, that of "Elohim, Jehovah, and Michael, which is Adam." Adam, again, is declared to be the "god" of Jesus Christ; Jesus Christ, the god of Joseph Smith; and Joseph Smith is now the god of this generation: but the whole affair is a mass of unintelligible rubbish. The human intellect probably never sank into more abysmal nonsense; all that can be definitely set before the mind is that Mormons believe that by faith, obedience, holiness, any man may rise into a deity, and acquire the power of making, peopling, and ruling a "world" forever! The *second* article of the Mormon creed affirms that "men will be punished for their own sins, and *not* for Adam's transgressions;" the *third* article states that "through the atonement of Christ, all mankind may be saved by obedience to the laws and ordinances of the Gospel." The *fourth* article affirms these "ordinances" to be: 1. Faith

in the Lord Jesus; 2. Repentance; 3. Baptism; 4. Imposition of hands by the gift of the Holy Spirit; 5. The Lord's Supper, administered kneeling. The saints, who are much averse to strong drinks, use water instead of wine in the sacrament, which is taken every week. The *fifth* article declares that "men must be called to the work of God by inspiration;" the *sixth*, that the same organization must now exist that existed in the primitive church; the *seventh*, that miraculous gifts—"discerning of spirits, prophecy, revelations, visions, healing, tongues," etc.—have not ceased. The "discerning of spirits" led Smith, or rather his friends Rigdon, Pratt, etc., who are understood to be the real authors of the metaphysics, into a variety of curious speculations. They believe that the soul of man was not created, but "coexisted equal with God." The *eighth* article is decidedly liberal; it expresses a belief that the word of God is recorded not only in the Bible and the book of Mormon, but in "all other good books." As for the contradictions that exist in the first, they are admitted, but it is alleged that they are "corruptions," and that they can be removed by any prophet's inspired explanations. On the other hand, the statement that the saints pretend to have a new and inspired translation of the Bible was denied by Brigham Young in a conversation with Dixon (*New America*, vol. i. pp. 216–217). The *ninth* article expresses a belief in all that God has revealed, is revealing, or will yet reveal. The *tenth* affirms the literal gathering of Israel, the restoration of the ten tribes (the "American Indians," who are, in consequence, treated with considerable humanity by the saints; the negro, on the other hand, being excluded from the Mormon church, as a descendant of Cain), the establishment of the new Zion on the western continent—the millennial reign of Christ on earth, and the transformation of earth into a paradise. The *eleventh* article maintains "the literal resurrection of the body." The *twelfth* article asserts the absolute liberty of private judgment in matters of religion; the *thirteenth* declares it the duty of the saints and all others to be "subject to the powers that be," whether monarchical or republican. The *fourteenth* and last is worthy of being universally accepted: "We believe in being honest, true, chaste, temperate, benevolent, virtuous, and upright; and in doing good to all men;" also that "an idle or lazy person cannot be a Christian, neither have salvation."

The great social peculiarity of the sect is their practice of polygamy. It was not so, however, at first. Rigdon, Kimball, Pratt, Hyde, and Young are its true originators; Emma, wife and widow of the prophet, stoutly denied that her husband ever had any wife but herself. Young's "revelation" she declared to be a fraud, and in consequence she withdrew to Nauvoo. Her four sons followed her, and have now founded a monogamic Mormon community, called the *Josephites*. Another branch of the Mormons (who altogether may number 200,000 souls) has recently settled at Independence, Missouri, the proposed site of the "New Jerusalem." Meanwhile, at Salt Lake City, the practice of polygamy is encouraged on the ground that the rank and dignity of the saints is proportioned to the number of their wives and children. A defense of the practice is also set up on moral grounds. Mormons assert that their community is free of the horrible sin and viciousness that prevail elsewhere; fornication and adultery, with their guilty passions and abandoned conduct, are declared to be unknown; their wives are asserted (Burton and others are very strong on this point) to be happy, virtuous, and healthy and they challenge comparison in regard to their domestic and social purity and felicity with any monogamic community in the world. Dixon (*New America*, vol. i. p. 243) even sings a sort of pæan on their virtues: "Their streets are clean, their houses bright, their gardens fruitful. Peace reigns in their cities. Harlots and drunkards are unknown among them. They keep open more common schools than any other sect in the United States."

See *Book of Mormon* (1830); *Book of Doctrine and Covenants*, consisting of select "revelations" given to Smith (1832); *The Pearl of Great Price*, also by Smith (first published, Liverpool, 1851); *Journal of Discourses*, by Brigham Young and others (1854 *et seq.*); *The Exploration and Survey of the Great Salt Lake*, by capt. Stansbury (1849); *The Mormons, or Latter-day Saints*, by lieut. Gunnison of the U. S. topographical engineers (1852); *The Mormons*, by col. T. L. Kane (1850); *The Mormons, or Latter-day Saints, with Memoirs of the Life of Joseph Smith* (office of the national illustrated library, London); *Voyage au Pays des Mormons*, par Jules Remy (1860); *The City of the Saints*, by R. F. Burton (1861); Dixon's *New America* (1867); and Busch, *Geschichte der Mormonen* (Leipsic. 1870); Mrs. Stenhouse, *An Englishwoman in Utah* (1880).

*MORMONS (*ante*). By the death of Brigham Young, which occurred Aug. 29, 1877, the office which he filled fell to John Taylor, an Englishman, though Young's actual position of leader of the Mormons descended to George Q. Cannon, entitled "first counselor" to the president, also an Englishman, a delegate in congress, the Mormon attorney at Washington, and one of the ablest and shrewdest men of the sect. The whole Mormon question has in recent years occasioned considerable uneasiness, both in congress and among the American press and people. The fact that this powerful body is being always increased by the steady influx of foreigners, influenced by a persistent course of proselytism in Europe, has been one reason for this uneasiness, since it results in the erection of an organization of persons alien in birth and sentiment to American institutions, and fostered into a compact body, subordinate to a central leadership, held together by a system combining religious and worldly benefits for the faithful, and in which superstition and entire self-abnegation for the good of "the church" fill important parts. In

1879 the secretary of state of the United States addressed a circular to the U. S. ministers abroad directing them to invite the attention of the governments to which they were severally accredited to the laws of the United States against polygamy. This circular also instructed the ministers to inform these governments as to whatever facts might be in their possession, or which they could obtain from consular agents or otherwise, as to the emigration of Mormons from the different countries; and to request the several governments to enforce existing laws against proselytism and the organization of emigration by the Mormon agents and missionaries. Certain of these governments replied to the diplomatic agents of the United States as to these requests, that it was deemed inexpedient and inconvenient to inquire concerning the religion or place of destination of persons leaving their shores. The circular from the secretary of state also expressed the determination of the government of the United States to enforce the law against polygamy contained in section 5352 of the *Revised Statutes* (the constitutionality of which had been recently sustained by a decision of the supreme court), and to eradicate the institution of Mormonism.

Of the 145,000 people in Utah, about 120,000 are Mormons. But this sect or nation does not alone hold sway in Utah. It has also the balance of power in Idaho and Arizona, and is rapidly populating Washington, Montana, Wyoming, and Colorado. The vote of Idaho, for congressman, at the election of 1880, is alleged to have been carried by an order from George Q. Cannon, directing that all the Mormons in that territory should vote for a certain man whom he named: all the Mormons in Idaho voted accordingly, as a unit. The Mormons are agriculturists, and wherever they go occupy the arable lands for their farms, and the hill-sides for pasturage for their stock. The mines are given up to the Gentiles, who become the patrons of the Mormons for their supplies. Already the Mormons have endeavored to place such a tax on the proceeds of mining in Utah as should render the business unprofitable, and thus remove the only temptation for Gentile settlement. The nature of the people by whom the Mormon territory is being constantly populated by immigration is of a kind to fall readily under the influence of astute leaders: an influence which is assisted by the ignorance and poverty of the immigrants. These immigrants, assisted in leaving a land where they have been forced to live in abject destitution, or by the most arduous labor for the mere necessaries of life, find themselves transported to a country rich in vegetables, meat, fruit, and fish; where, among a people industrious, comfortable, and apparently happy, they are easily imbued with the principles under which these conditions have seemingly been wrought out. The result is subordination to the commands of their leaders; and a confiding belief in the merits of the church and the sect, which is sufficient to render them instruments in the hands of the president and his subordinates. With the death of Brigham Young, the individual leadership of the Mormons ceased. From a statement made by the Mormon "bishop" Henry Lunt, of Cedar City, Utah, to a correspondent of the *San Francisco Chronicle*, the following summary of the main features of the organization is condensed: First, there is a president, and he has two counselors. Second, there are twelve apostles. The president is one of them, and each receives a salary of $1500 per annum; the president, moreover, exercising an authority equal to that of the other eleven. Third, there are seven presidents designated as the presidents of the seventies, each body consisting of seventy elders, there being eighty of these seventies in Utah, each seventy having seven presidents, and each seven one president. The seventies make annual reports, and all of these officials mentioned constitute the general authorities of the church. Next comes the head patriarch of the church, the dignity being hereditary when the candidate is worthy, the incumbent residing at Salt Lake City, and being endowed with the power to bless the people by laying on of hands: the present incumbent is John Smith, nephew of prophet Joseph Smith. There is next a presiding bishop who attends to the collection of tithes: the collection from this source being $1,000,000 annually. "Zion" is divided into 23 stakes, each of which has a president, and is divided again into wards, and each ward into districts: the district has a quorum of teachers, whose business it is to visit each family periodically, and look after the spiritual welfare of the members. Each district has a meeting-house, Sunday-school, day-school, young men's mutual improvement society, primary association for small children, and usually a dramatic society. At Cedar City there is a co-operative store, a tannery, and a grist-mill. The church organization ends with the priests and deacons. Out of a total population of about 150,000, there are 30,000 children in Utah under eight years of age. There is a Sunday-school organization known as the Deseret Sunday-school union: there is also a perpetual immigration fund.

As to the possible future of the institution of Mormonism it is proper to quote the following statement of Lunt, setting forth the hopes and designs of the Mormons themselves: "Like a grain of mustard was the truth planted in Zion, and it is destined to spread through all the world. Our church has been organized only fifty years, and yet behold its wealth and power. We look forward with perfect confidence to the day when we will hold the reins of the U. S. government. That is our present temporal aim; after that we expect to control the continent." When the newspaper correspondent, to whom this was said, remarked that such a scheme seemed somewhat visionary, considering the fact that Utah cannot secure recognition as a state, the bishop's reply was: "Do not be deceived; we are looking after that. We do not care for these territorial

officials sent out to govern us. They are nobodies here. We do not recognize them. Neither do we fear any practical interference by congress. We intend to have Utah recognized as a state. To-day we hold the balance of power in Idaho, we rule Utah absolutely, and in a very short time we will hold the balance of power in Arizona and Wyoming. A few months ago president Snow, of St. George, set out with a band of priests for an extensive tour through Colorado, New Mexico, Wyoming, Montana, Idaho, and Arizona to proselyte. We also expect to send missionaries to some parts of Nevada, and we design to plant colonies in Washington territory. In the past six months we have sent more than 3,000 of our people down through the Sevier valley to settle in Arizona, and the movement still progresses. All this will help build up for us a political power which will, in time, compel the homage of the demagogues of the country. Our vote is solid, and will always remain so. It will be thrown where the most good will be accomplished for the church. Then, in some great political crisis, the two present political parties will bid for our support. Utah will then be admitted as a polygamous state, and the other territories we have peacefully subjugated will be admitted also. We will then hold the balance of power, and will dictate to the country. In time our principles, which are of sacred origin, will spread throughout the United States. We possess the ability to turn the political scale in any particular community we desire. Our people are obedient. When they are called by the church they promptly obey. They sell their houses, lands, and stock, and remove to any part of the country the church may direct them to. You can imagine the results which wisdom may bring about, with the assistance of a church organization such as ours. It is the completest one the world has ever seen. We have another advantage. We are now and shall always be in favor of woman suffrage. The women of Utah vote, and they never desert the colors of the church in a political contest. They vote for the tried friends of the church; and what they do here they will do everywhere; our principles and our institutions spread."

Three years prior to the death of Brigham Young his nineteenth and last wife, Ann Eliza Webb, broke away from Mormonism, and traveled through the United States delivering lectures against the institution, and particularly its polygamous feature. These lectures produced no small impression. Congress has frequently, in recent years, taken cognizance of the condition of Utah and the institution of Mormonism. In 1873 Mr. Frelinghuysen introduced a bill which severely censured the practice of polygamy among the Mormons, and declared that their wives could claim relief by action for divorce. In 1874 the committee of the house of representatives having the matter in charge reported a bill which was still more sweeping in its character, being destructive of all local authority in Utah, and, in fact, placing the territory in the condition of a province, in its relation to the U. S. government. By this bill the control of affairs in Utah was placed in the hands of federal officials, and its practical application would have been to root out the foundation of the system on which Mormonism depended for its existence. During the same year the case of a contest of the election of George Q. Cannon, as delegate from Utah, came up in the house of representatives, and was decided in his favor. But this decision was accompanied by the passage, by a vote of 127 to 51, of a resolution appointing a committee of investigation into the polygamous relation sustained by delegate Cannon, who, it was alleged, was united by the marriage tie of the Mormon church to four wives. Still later in 1874, what was known as the "Utah judiciary bill," passed the house by a vote of 159 to 25, in the face of a resolute and eloquent defense of Mormon institutions by delegate Cannon. This bill was supposed to comprise "a definite and serious attack at the very foundation of Mormonism." Notwithstanding the action taken by congress on these and other similar bills, no important change has been made in the conduct of affairs in Utah, or in the nature and influence of Mormonism, either as to the increase of the number of its adherents by foreign proselyting and immigration, or by any decline in the spread of its tenets and its power in the territories of the United States. See *Supp.*, page 883.

MORMYR'IDÆ, a family of malacopterous fishes, allied to the *esocidæ,* or pike family; having longish compressed bodies, and a slender tail, swelling out at the origin of the caudal fin. The skin of the head is naked, enveloping the gill-covers and gill-rays, leaving only a slit for gill-opening. The mouth is small. All the known species inhabit the rivers of Africa. The SHARPED-NOSED MORMYRUS (*Mormyrus oxyrhynchus*) is regarded as one of the best fishes of the Nile. It is caught by lines baited with worms. The mormyridæ are nocturnal fishes. They are sometimes represented on Egyptian monuments, and seem to have been held sacred by the ancient Egyptians. The modern Egyptian name is *Mizdeh.* Some of the species have electric organs.

MORNAY, PHILIPPE DE, Seigneur du Plessis-Marly, 1549–1623; illustrious as a writer and actor during the most direful period of religious intolerance in France. He was son of a Roman Catholic father who destined him for the church, and of a Protestant mother whose opinions he imbibed; becoming according to Voltaire "the most virtuous, and greatest of men." Thoroughly educated in school, and by much travel in youth in Italy and Germany, we find him at the age of 22 at Cologne engaged in theological discussions and writings to inspire the low countries to defy the Spanish power. His address to Coligny, then minister of France, designed to secure that minister's influence for William of Orange, was a marvel of literary power. The minister had already

resolved to send Mornay as confidential representative to that prince when the massacre of St. Bartholemew's took place and the young writer barely escaped from Paris with his life. He fled to England, and immediately sought the influence of Elizabeth to avert the further destruction of Protestants in France. He took part with La Noné in an unsuccessful movement of the Huguenots at St. Germain; married an accomplished Protestant lady in 1576, and immediately after joined the army of Condé in France, from which he was called to become a member of the council of Henry of Navarre. By him he was sent to England on a mission; was intercepted by the Spaniards who, ignorant of his mission, permitted him to escape; and finally succeeded in procuring from Elizabeth 80,000 écus for Condé's army. He remained some years in England occupied in strengthening the Protestant cause at the English court, by his writings, and by material aid. In 1584–88 he was member of the two royal political councils of Montauban and La Rochelle, and remained chief counselor of Henry III. until his assassination. He then served Henry IV., and was by him made councilor of state and engaged in delicate negotiations. When the king abjured Protestantism Mornay broke with him, and published an essay on the institution of the eucharist, in which he shows the mass to be condemned by the New Testament and the fathers of the church. It brought upon his head a storm of invective from all sides, but the answers published only served to cause the more universal reading of the heretical tract. Challenged by Du Perron bishop of Evreux, to maintain the truth of some of its statements in open discussion, he accepted, and was caught in a trap carefully prepared to show some of his statements false. This was May 4, 1600. Henry IV. was glad to be sustained in his treachery to old Protestant friends by the apparent defeat of their ablest champion, and Mornay was retired from public life until 1617, when he appeared in an assembly of notables at Rouen, and again in 1620 in efforts to bring conciliation between insurgent Huguenots and the government of Louis XIII., and soon after retired to his chateâu to die. By the Catholics he was called the pope of the Huguenots. In controversial writings he was prolific, scholarly, and brilliant.

MORNING GLORY. See Convolvulus, *ante*.

MORNY, Charles Auguste Louis Joseph, Comte de, a French statesman, of the second empire, regarding whose parentage the biographical dictionaries published under imperial censorship are strangely silent. It is, however, universally believed that he was the son of queen Hortense and of the comte de Flahault, and consequently half-brother of Louis Napoleon. He was born in Paris, Oct. 20, 1811. The comte de Morny, a French nobleman resident in Mauritius, received 800,000 francs to adopt him as his son; but he was educated by his "grandmother," Madame de Flahault; and queen Hortense left him at her death, in 1837, an annuity of 40,000 francs. Morny entered the army in 1832 as a sub-lieut. and is said to have shown at this early period a predilection for metaphysics and theology, which is indeed sufficiently surprising, if true, considering his subsequent thirst for material gratifications. He served with some distinction in Algeria; but he soon abandoned a military life, and in 1838 made his début in the world of industry as a manufacturer of beet-root sugar, and published a pamphlet on the subject. Ever after that time, he was mixed up in all sorts of commercial and financial speculations—railway companies, canal companies, French and foreign mining companies, credit societies, industrial enterprises, etc. Chosen a deputy in 1842, he quickly attained a prominent position on account of his aptitude for dealing with financial questions; but events showed that he was not free from the reckless spirit of an adventurer, and his daring at times excited a suspicion of enormous swindling somewhere. After the revolution of 1848, he became attached to the cause of his half-brother, and was the leader of the subtle and treasonable policy of the Elysée. He took a prominent part in the *coup d'état*. His rôle was to exhibit *sang-froid*, and to throw the republican leaders off their guard. Nor did he fail of success. He passed the evening of Dec. 1 at the *Opéra Comique*, and yet, by six o'clock next morning the deed was done, and Morny was minister of the Interior. In 1854 he became president of the *Corps Législatif*, and was ambassador to Russia during 1856–57, where he married the rich and handsome princess Trubetskoi. The result of his Russian mission was the establishment of intimate political relations between the two governments, and a commercial treaty advantageous to both countries. He died May, 1865.

MOROCCO, or Marocco, called by the natives *Maghrib-el-Aksa*, "the extreme west," or briefly *Maghrib*, an empire or sultanate in the n.w. of Africa, is bounded on the e. by Algeria, on the n. and w. by the Mediterranean sea and Atlantic ocean, and on the s. by a line which runs from cape Nun (lat. 28° 45′ 43″ n.), in an easterly direction through the Sahara to the Algerian frontier in long. 2° east. At the present day, Morocco includes the three former kingdoms of Maghrib, Fez, and Tafilelet, and contains about 260,000 English sq.m., with a population of which the estimates vary from 2,500,000 to 8,000,000. The country is generally mountainous, the Atlas (q.v.) range traversing it in several parallel chains from s.w. to n.e., and sending out numerous spurs to both the coast-country and the desert. There are, however, many level tracts throughout Morocco, especially at its western and eastern extremities, and on the borders of the desert. The central range of the Atlas forms the water-shed separating the streams which flow into the Atlantic and Mediterranean from those which run southward to the desert. The former

rivers have the shorter course and less volume, but they are perennial; while the latter become dry in summer, and even when running are lost in the sands of the Sahara. The chief rivers are the Muluya, with its tributary the Sharef, which drains the n.e. of the country, and falls into the Mediterranean after a course of 400 m; the Kos, Oom-a-beg, Bu-Regreb, Tensift, Suse, and Assaker, the last forming for part of its course the southern boundary of Morocco, drain the central and western districts, and fall into the Atlantic; the Draha, Fileli, Ziz, and Gir, irrigate the dry plains of Tafilelet, and the first-mentioned then empties itself into the Atlantic ocean. The subsequent courses of the other three rivers are not yet well ascertained.

The *climate* between the central range of Atlas and the sea is temperate, the thermometer seldom falling lower than 40° F., or rising above 90° F., owing partly to the regulating influence of the sea breeze, and the shelter afforded by the mountains from the scorching winds of the desert; but in the s.e. districts, extremes of heat and cold are said to prevail, and rain is there unknown.

Among the chief *products* of the country are wheat, barley, rice, maize, durra, and sugar-cane; and among fruits, the fig, pomegranate, lemon, orange, and date are common; while cotton, tobacco, hemp, etc., are largely produced both for home use and export. Morocco is supposed to be rich in mineral treasures; plentiful supplies of copper are obtained at Teseleght, near the source of the Assaker, and gold and silver occur in several places. Iron, antimony, lead, tin, and rock-salt, the last three in considerable quantity, are also found. Owing to the character of the country and its thin population (35 to the English sq.m.), Morocco is much infested with wild animals. Lions, panthers, hyenas, wild boars, and various kinds of deer, gazelles, etc., abound in suitable localities, and occasional devastations are committed by locusts. Ostriches are found in Tafilelet. The Moorish horses, formerly so famous, are now much degenerated. The breeding of sheep, oxen, goats, camels, mules, and asses forms an important item of national industry. Oxen and bulls are chiefly employed in field labor.

The *inhabitants*, like those of Barbary in general, consist of Moors, Berbers, Arabs, Negroes, and Jews, with various intermixtures between these races. More than two-thirds of the population belong to the race commonly called Moors, the remaining third consisting mainly of Berbers or Amaziyehs (including the Berbers of the Riff coast, and the Shelluhs of the Great Atlas); Jews, estimated at 340,000; and negroes. Very few Europeans reside in Morocco. The state of civilization is very low, and many of the Amaziyehs are complete savages. Excepting the Jews and the few Europeans, the whole population is Mohammedan. Negroes are brought into the country as slaves from Sudan.

Morocco is divided into four territories—Fez, Morocco, Suse, and Tafilelet. For convenience of administration, the empire is subdivided into 33 governments or districts ("ammala"), each under the superintendence of a "caid," whose chief duty it is to collect the imposts; but the semi-independent tribes are ruled by their own chiefs, and scarcely acknowledge the authority of the sultan. The government is purely despotic, and in the absence of written laws, the will of the sultan and his subordinates decides everything. The public officials eke out their allowances by practicing extortion on those under their charge, and are in turn plundered by their superiors. The sovereign of Morocco, called by Europeans the emperor of Morocco, is known among his subjects as sultan, and assumes the titles of *emir-ul-mumenin*, or "prince of the believers," and *khalifeh-allah-fichalkihi*, or "vicegerent of God upon earth." The title is hereditary in the male line, but does not necessarily descend to the eldest son.

Education consists in learning to read, write, and recite portions of the Koran, and this quantum of education is pretty generally diffused among the people, but the art of printing is unknown, and the arts and sciences are at a very low ebb.

The only industrial arts prosecuted to any considerable extent are the manufactures of caps, fine silks, and leather. In the production of this last, the Moors far surpass Europeans, and are able to render any kind of leather extremely soft and white, by the use, it is said, of two species of plants found in the country, and unknown to Europeans. They also excel in the production of brilliant colors in leather. The yellow leather is made in Morocco proper, the green in Tafilelet, and the red in Fez. There is an important caravan trade between Morocco and Sudan, and also with Mecca and the Levant. The principal exports are wool, hides, grain, cattle and sheep, leather, salt, etc.; and the imports, cotton, linen, and muslin goods, sugar, tea, coffee, hardware, gold dust, indigo, ivory, etc. Mules, horses, and camels form the internal means of transport. Much of the Arabian trade is carried on by coasting vessels between Tangier and Egypt, as the carriage across the desert is very costly. At the present time, two-thirds of the entire trade of Morocco is in the hands of British merchants.

The army consists of between 20,000 and 30,000 men, of whom one-half are negroes; there is also a sort of militia, amounting to 80,000 or 100,000 men, which is occasionally called out. The navy is now insignificant; but in former times, especially in the 16th and 17th centuries, it was very formidable to the maritime powers of Europe, and was chiefly occupied in piratical expeditions. See RIFF.

The history of Morocco is, generally speaking, similar to that of the rest of Barbary (q.v.) down to the end of the 15th century. About that time, it was formed into a monarchy, and, notwithstanding internal divisions, enjoyed considerable prosperity, and

the confines of the empire were extended as far south as Timbuctoo. This empire fell to pieces, and was succeeded in 1647 by that of the sherifs of Tafilelet, who conquered both Morocco proper and Fez, and united the whole country under one government. This is the present ruling dynasty. In the middle of the 17th c. the empire of Morocco embraced part of the present province of Algeria, and extended south as far as Guinea, where it came into collision with the Portuguese settlements. Since the commencement of the 19th c. the rebellions of the wild mountain tribes, the disturbances in Algeria, and difficulties with foreign states, caused by the aggressions of the Riff pirates, have greatly retarded the well-conceived measures of the various rulers for the development of the resources and increase in civilization of Morocco. In 1814 the slavery of Christians was abolished; and in 1817 piracy was prohibited throughout Morocco. In 1844 Morocco took part in the war of Abd-el-Kader against the French, in the course of which Tangier was bombarded and Mogadore occupied; but peace was concluded in the same year. In 1851 and 1856 complications took place with France concerning some French vessels which had been plundered by the Riff pirates, but in each case compensation was given by the sultan. In 1859 the Spanish government, smarting under a series of similar outrages, demanded compensation, and also an apology for an insult to the Spanish flag at Ceuta; and on the sultan's disclaiming all responsibility for these acts, war was declared by Spain, Oct. 22, 1859, and a large force under marshal O'Donnell invaded Morocco. Two battles were fought, several ports were bombarded, and Tetuan taken, and on Mar. 25, 1860, the sultan yielded. A treaty was accordingly signed, April 27, 1860, by which the sultan ceded some portions of his territory, paid 20,000,000 piastres towards the expense of the war, and granted several commercial privileges to Spanish merchants.

MOROCCO (Arab. *Marakash*), the capital of the empire of the same name, is situated in the s.w. of the country, four miles s. of the river Tensift, and at the n. end of an extensive and fertile plain. It is surrounded by a strong lime-and-earth wall thirty feet high. The town is ill built, the streets narrow, irregular, and unpaved; the houses, generally built of the same materials as the wall, are one story high, with flat roofs, and narrow openings instead of windows. A large portion of the space within the walls is occupied with gardens, open areas, and market-places. In the bazaar and market-place a large miscellaneous trade is carried on. Morocco possesses twenty mosques, of which six are remarkable for their size and elegance. There are several tanning and leather-dyeing establishments, some of them of great extent. The population is estimated at about 60,000.

On the s. of the city, outside the walls, stands a palace of the sultan of Morocco, occupying a space of about 180 acres.

Morocco was founded in 1072, and reached the summit of its prosperity in the 13th c., when it contained more than 700,000 inhabitants, since which time it has been rapidly decaying. It is now half in ruins.

MOROCCO LEATHER. See LEATHER, *ante*.

MORON', a town of Spain, in the province of Seville, and thirty-seven m. s.e. of the city of that name, on the Guadeira. It is built on irregular acclivities, and contains the remains of a once almost impregnable castle, erected by the Moors on Roman foundations. The inhabitants are engaged in the culture and preparation of olive oil. Pop. 9,000.

MORPETH, a market-town and parliamentary and municipal borough of England, in Northumberland, is situated on the Wansbeck, fifteen miles north of Newcastle. Of the principal buildings, the parish church dates from the 14th c.; the free grammar school of Edward VI., founded in 1552, has an income from endowment of £650 a year; the town-hall was erected by Sir John Vanbrugh. Flannel is manufactured; brewing, malting, and tanning are carried on, and iron-foundries and corn-mills are in operation. Morpeth returns two members to the house of commons. The pop. of the parliamentary borough in 1881 was 33,402.

MORPHEUS (literally, the "shaper" or "fashioner"), in the classic mythology, the son of Somnus, (Sleep), because he shapes or moulds the dreams that visit the sleeper. He is first mentioned by Ovid, and is represented as an old man with wings, pouring somniferous vapor out of a horn,

MORPHIA ($C_{34}H_{19}NO_6 + 2$ Aq) derives its name from Morpheus, in allusion to its narcotic properties. It is the most important of the alkaloids existing in opium, of which it constitutes from one-eighth to one-sixteenth by weight. It occurs in combination with meconic, and sometimes with sulphuric acid. It is obtained in short rectangular prisms, containing two equivalents of water of crystallization, which are expelled at a gentle heat, when the morphia melts into a resinoid substance. Morphia is soluble in about 1,000 parts of cold and in 400 of boiling water; boiling alcohol dissolves it freely, but it is insoluble in ether and chloroform. Its solutions have a bitter taste, and change the yellow color of turmeric paper to brown. Morphia is not so easily detected in cases of poisoning by opium as meconic acid (q.v.). The following are the ordinary tests for it: Concentrated nitric acid, when applied to a crystal either of morphia or of one of its salts, produces an orange color. A mixture of nitric and sulphuric acids colors it green.

When it is mixed with iodic acid, iodine is liberated; which may be recognized by its brown color and by the well-known starch-test. A neutral solution of perchloride of iron produces a beautiful blue color.

Morphia is the only opium-alkaloid which is soluble in lime-water, and this property affords one of the best means of extracting it. A watery infusion of opium is boiled with milk of lime, filtered, mixed with powdered sal-ammoniac, and again boiled. By this means the lime is converted into the hydrochlorate (or, more correctly, into chloride of calcium), the ammonia is volatilized by the heat, while the morphia is precipitated in a crude form, which admits of easy purification.

Morphia combines with acids to form crystallizable salts, which are readily soluble in water and in alcohol. Of these, the *hydrochlorate* (*muriate*) and the *acetate*, especially the former, are much used in medicine.

The therapeutic uses of morphia and its salts are very similar to those of opium (q.v.); but the preparations of morphia are preferable to opium and laudanum in being less liable to occasion nausea and headache. The ordinary dose of morphia, or its hydrochlorate or acetate, when given to an adult to allay pain or induce sleep, ranges from a quarter of a grain to half a grain.

MORPHOLOGY. See METAMORPHOSIS OF ORGANS.

MORPHOLOGY, ANIMAL. See METAMORPHOSIS OF ANIMALS.

MORPHY, PAUL CHARLES, b. New Orleans, 1822; educated at St. Joseph's college. While still a boy he developed remarkable skill in the game of chess, and soon became enthusiastic concerning it, and devoted most of his time to this amusement, which was to him a serious study. He speedily became so proficient as to defeat with ease the players of his native city, and his remarkable skill began to attract general attention among chess-players throughout the country. In 1857 the first chess congress was organized in New York, and Morphy, being specially invited to attend, played daily at the rooms of the congress, which were crowded by persons interested in chess, who were astonished at his remarkable facility in this difficult game. He defeated with ease such players as Paulsen, Fiske, Marasche, Lichtenhein, Thompson, Meade, and others, the leading chess amateurs of the country; and in 1858 made his first public exhibition of those astounding *tours de force*, blindfold games, as to which he had but one equal competitor, Paulsen, who was, however, a far inferior player before the board. In the same year he visited London, where he played with Löwenthal, winning a majority of games. He attended, at Birmingham, the annual meeting of the British chess association, where he played eight games at once without the board, defeating his opponents in six of them. In Paris he played at the celebrated chess resort, the *café de la régence*, and defeated the great French players, Rivière, Laroche, Jowmand, and Devinck; beat Harwitz five games out of seven, losing one and drawing one; and out of eleven games played with Anderson, the German champion, beat seven and drew two. He remained abroad until the spring of 1859, exhibiting his remarkable powers with and without the board, and on his return to the United States, was admitted to the bar of New Orleans, where he has continued to reside, practicing, however, but little. He greatly injured his health by the strain upon his mental faculties, occasioned chiefly by his blindfold playing, and was forced at last to give up chess altogether, and never quite recovered his mental condition. He d. at New Orleans, 1884.

MORRELL, WILLIAM, b. England; came to Massachusetts bay with captain Robert Gorges, in 1623. He spent a year in the Plymouth colony, and on his return to England published a Latin and English poem, called *Nova Anglia*, suggested by his observations in America. It has been republished by the Massachusetts historical society. Little is known of his life, except that he was a clergyman.

MORRILL, DAVID LAWRENCE, LL.D., 1772–1849, b. N. H.; at first a physician, then a Congregational pastor at Goffstown. In 1807 he resumed the practice of medicine, from which he retired in 1830. He served for a number of terms in the New Hampshire legislature, of which he was chosen speaker in 1816 and in 1823 he was president of the state senate. In 1817 he was elected U. S. senator, and on the expiration of his term, was elected governor.

MORRILL, JUSTIN S., b. Vt., 1810; a merchant, and afterwards a farmer. He was a member of congress from Vermont, from 1855 to 1867. During much of this period he was chairman of the ways and means committee, and had an important part in the economical and financial legislation that came before congress. He is the author of the famous Morrill tariff of 1861, and a strong advocate of protection. He was elected U. S. senator in 1867, and has been twice re-elected.

MORRILL, LOT M., b. Me., 1813; graduated at Waterville college (now Colby university); was admitted to the bar in 1839. In 1854 he was elected a member of the Maine legislature; two years later, president of the state senate, and in 1858–60, governor. From 1861–76 he was a U. S. senator, an office he resigned to accept the appointment of secretary of the treasury, June 21, 1876. After serving until the completion of president Grant's administration, he received the appointment of collector of customs at Portland, Me., which post he held until his death, 1883.

MORRIS, a co. in e. central Kansas; 700 sq.m.; pop. '80, 9,266—8,243 of American birth. The surface is level and generally fertile. Most of it is prairie, and in the w. portion there is little or no timber. It is watered by the Osage river, and numerous small tributaries of the Kansas river. Limestone is found in some parts. The principal productions are Indian corn, wheat, oats, potatoes, hay, and cattle. It is on the Missouri, Kansas, and Texas railroad. Co. seat, Council Grove.

MORRIS, a co. in n. New Jersey, bounded on the n.e. by the Pequannock river, on the e. and s.e. by the Passaic river, and on the n.w. by the Musconetcong; 650 sq.m.; pop. 80, 50,830—41,882 of American birth. The surface is uneven and crossed by a number of ridges, of which one of the highest, Schooley's mountain, is a summer resort. A large portion is heavily wooded with hickory, oak, and chestnut. There are a number of iron mines, and zinc, copper, and manganese are found. Marble, limestone, and sandstone abound. The principal agricultural products are Indian corn, wheat, oats, rye, buckwheat, and potatoes. Large numbers of the inhabitants are employed in the iron mines, and in the manufacture of nails, and rolled and forged iron. Among the other articles manufactured are woolen and cotton goods, carriages and wagons, sashes and blinds, paper, and brick. There are a number of flour-mills, saw-mills, machine-shops, and distilleries. It is on the Morris and Essex railroad, and the Morris canal. Co. seat, Morristown.

MORRIS, a co. in n.e. Texas, s. of the Sulphur Fork of the Red river. The surface is diversified, and heavily timbered with oak, hickory, ash, and cypress. The soil is fertile, but not much cultivated. The county has lately been set off, and has not yet become thickly settled. Co. seat, Daingerfield. Pop. '80, 5,032.

MORRIS, a city and the co. seat of Grundy co., Ill., on the n. bank of the Illinois river, and the Illinois and Michigan canal, and on the Chicago, Rock Island, and Pacific railroad; pop. '80, 3,486. It has a high-school, 2 newspapers, 2 national banks, and 7 churches. St. Angela's academy, for the higher instruction of women, is here, a Roman Catholic institution, established in 1857. The city is the center of a considerable trade in grain. There are mines of bituminous coal, and flouring mills. Agricultural implements and furniture are also made.

MORRIS, Benjamin Wistar, d.d. See page 884.

MORRIS, Charles, 1784–1856; b. Conn.; entered the navy in 1799. He was attached to the American squadron in the war with Tripolis, and was made lieut. in 1807. In the war of 1812 he was first lieut. of the *Constitution*, and was dangerously wounded in the engagement between that frigate and the *Guerriere*, Aug. 19, 1812. Two years later, in command of the *Adams*, he cruised along the coast in search of British merchantmen. He was attacked on the Penobscot river by a superior British force, and was obliged to destroy his ship. He continued in the service for the rest of his life, holding various commands. He was successively chief of the bureau of construction, inspector of ordnance, and from 1851 till his death chief of the ordnance bureau.

MORRIS, Clara. See page 884.

MORRIS, Edward Joy, b. Philadelphia, 1815; educated at Harvard; elected to the Pennsylvania legislature in 1841. He was a member of congress, 1843–45; and again, 1857–61. He was *chargé d'affaires* at Naples 1850–54, and minister to Turkey 1861–70. Morris published a *Tour through Turkey, Greece, Egypt, and Arabia Petræa; The Turkish Empire;* and some translations. He d. 1881.

MORRIS, George P., 1802–64; b. Penn.; at an early age he became a journalist in New York city, where in 1823 he established *The Mirror*, a literary weekly that he continued to publish until 1842, when he united with N. P. Willis in publishing *The New Mirror* a year or more, and then *The Evening Mirror*. These publications were the representatives of the best literary, dramatic, and artistic interests of the day, having among their contributors Bryant, Halleck, Poe, Paulding, Leggett, Hoffman, and most of the well-known literary men of New York. In 1845 Mr. Morris originated another journal, *The National Press*, which eventually became *The Home Journal*. It is as a song-writer, however, that he is chiefly remembered; and among the songs which made his name familiar may be mentioned particularly: *Woodman, Spare that Tree, My Mother's Bible, We were Boys Together*, and *A Long Time Ago*. In 1853 he published *The Deserted Bride, and other Poems;* and also during the same year he edited, with Mr. Willis, *Prose and Poetry of Europe and America*. Another of his successes was a drama, *Brier Cliff*, which was played forty consecutive nights in one of the New York theaters.

MORRIS, George Sylvester, b. Vt., 1840; graduated at Dartmouth college, where he was afterwards tutor. After spending a number of years abroad, in the study of philosophy, he was appointed, in 1870, professor of modern languages, and literature in the university of Michigan. He published a translation of Ueberweg's *History of Philosophy*, in 1871. His *British Thought and Thinkers* appeared in 1880; *Philosophy and Christianity*, 1883. He is a lecturer in Johns Hopkins univ., Baltimore.

MORRIS, George U., 1830–75; b. Mass.; entered the navy in 1846, and was lieut., in command of the Cumberland when she was sunk by the Merrimack, Mar. 8, 1862, on which occasion his cool courage gained great praise. He was made a commander in 1866, and placed on the retired list in 1874.

MORRIS, Gouverneur, 1752–1816; b. N. Y.; educated at Columbia, then known as King's, college; studied law, and was admitted to practice in 1771. He was known as a writer of ability while still in his teens; and certain papers by him on finance were highly considered. In 1775 he was sent as a delegate to the provincial congress, and was one of the committee that drafted the constitution for the state of New York. In 1777 he was a member of the continental congress, and of the committee appointed by that body to investigate and report on the condition of Washington's army, then at Valley Forge. He was appointed by Robert Morris, in 1781, assistant superintendent of finance, and held the position for about three years, when he entered into mercantile business. He was sent by Pennsylvania as a delegate to the constitutional convention of 1787, and was appointed one of the committee of five appointed to draft the constitution. In 1791 he was sent by Washington to England on a diplomatic mission; and in the following year was named minister to France, where he remained until 1794, when the French government requested and obtained his recall. In 1800 he was elected to the U. S. senate by the legislature of the state of New York, to fill out an unexpired term. He retired from public life after he had completed the period for which he was elected. He is said to have been an eloquent speaker, and remarkably well-informed.

MORRIS, Henry W., 1806–63, b. N. Y.; entered the navy in 1819, and was made capt. in 1856. He was attached to the African, Brazilian, and Mediterranean squadrons successively, and at the beginning of the rebellion was in Washington superintending the construction of the *Pensacola*. He succeeded in running her by the confederate batteries on the Potomac early in 1862, and reached the federal blockading squadron in the gulf of Mexico. He distinguished himself in the attacks upon forts Jackson and St. Philip at New Orleans, after the capture of which he took the command of the squadron stationed there.

MORRIS, John G., d.d., ll.d., b. Penn., 1803; educated at Dickinson college and Princeton theological seminary. From 1826 to 1859 he was pastor of Lutheran churches in Baltimore. He catalogued the books in the Peabody institute at Baltimore, of which he was the first librarian, and prepared a list of lepidoptera found in the United States for the Smithsonian institution. He has edited the *Lutheran Observer* and other periodicals, and has written a number of books: *Popular Exposition of the Gospels; The Life of Catharine de Bora;* and some translations from the German.

MORRIS, John Thomas, b. India, 1826; studied at Trinity college, Cambridge, where he became a Roman Catholic. He completed his education in the English college at Rome, and was ordained to the priesthood. After passing three years in the diocese of Northampton he returned to Rome, and became vice-rector of the English college. At the end of three years he went back to England, where he was appointed canon residentiary of the London chapter. He also acted as private secretary to cardinal Wiseman, and his successor, cardinal Manning. In 1867 he became a member of the society of Jesus. He was for a time rector of a Jesuit college in Malta, and is now professor of canon law and church history in St. Beuno's college. He has published a *Life of St. Thomas of Canterbury; Condition of Catholics under James I.; The Troubles of our Catholic Forefathers,* 3 series; *The Letter-books of Sir Amias Poulet;* and *Cardinal Wiseman's Last Illness.*

MORRIS, L. N., 1800–46; b. New York; grandson of Lewis (signer of the declaration of independence); educated at West Point military academy, graduating in 1820. He was occupied in garrison and frontier duty until the war with Mexico, when he went into active service, and distinguished himself at the battles of Resaca de la Palma and Palo Alto. He was killed at Monterey, being, at the time of his death, a brevet maj. and capt. of the 3d regiment, U. S. infantry.

MORRIS, Lewis, 1671–1746; b. N. Y.; son of an officer in the army of Oliver Cromwell, who in 1672, settled where Morrisania now is on a farm of 3,000 acres. He ran away from home when a lad, and visited Virginia and the West Indies. Returning he studied law, and at the age of 21 was a judge of the superior court of New Jersey, a member of the council, and afterward member of the assembly. He became chief-justice of New York and New Jersey; state councilor, 1710–38; acting governor, 1731; and governor of New Jersey in 1738, retaining the office until his death.

MORRIS, Lewis, 1726–98; b. N. Y.; educated at Yale college, where he graduated in 1746. He farmed the family estate at Morrisania, but in 1786 sold it to his brother Gouverneur. He was a member of the provincial congress of 1775; and on the close of the session was dispatched on a mission to gain the adherence of the Indians in the coming struggle. He was again in congress in 1776, and was one of the signers of the declaration of independence. His property was seized by the British, and the family homestead demolished as reprisal for this act. Mr. Morris was a member of the legislature of the state of New York after the organization of the state government.

MORRIS, Lewis O , d. 1864; son of brevet maj. L. N. Morris; was a second lieut. in the U. S. army, and served in the war with Mexico. In 1861 he was in command of a battery stationed in Texas, and on the outbreak of hostilities, though summoned to surrender it to the confederates, refused to do so. In 1862 he was appointed col. of

the 113th N. Y. volunteers; and shortly after, being stationed at Washington, his command was converted into a heavy artillery regiment, and in the spring of 1864 was attached to the army of the Potomac and participated in all the engagements of the campaign. He commanded a brigade at the battle of Cold Harbor, June 3, 1864, where he was shot at the head of his men.

MORRIS, Richard, ll.d., b. England, 1833; educated at St. John's college, Battersea. He became lecturer on the English language and literature in King's college school in 1869, and took holy orders in 1871. Four years later he was made head-master of the royal masonic institution for boys in 1875. He has edited a number of publications for the early English text society, the Chaucer society, and the philological society; and was elected president of the latter in 1874, and is still a member of its council. Besides his editions of early English works, he has published *The Etymology of Local Names*, 1857; *Specimens of Early English*, 1867; *Historical outlines of English Accidence*, 1872; *Elementary Lessons in Historical English Grammar*, 1874; and *Primer of English Grammar*, 1875.

MORRIS, Robert, 1734–1806; b. in Lancashire, England; received a common school education only; was brought to this country by his father, and when about 15 years old entered the counting-house of Charles Willing, a Philadelphia merchant, and continued in the firm for many years, gradually rising by his integrity and ability until, in 1754, he was made a partner. When the revolution broke out he had already acquired a very large fortune, and the firm was second to none in the state in the extent of its business. He at once ardently sided with the patriot party, and by assenting to the non-importation act, 1765, sacrificed great trade advantages for sake of principle. In 1775 he was a delegate to the continental congress, and was a signer of the declaration of independence, though he had opposed its adoption as ill-timed. He served for several years on the committee of ways and means, and in that capacity was of immense assistance to the cause not only by his sagacity as a financier, but by his personal credit. More than once he rescued congress from a seemingly fatal crisis by borrowing money on his own name and that of his firm; the $1,500,000 which enabled Washington to carry out his last campaign against Cornwallis was raised by his exertions and on his own notes. From 1781 to 1784 he was superintendent of finance and was vested with complete control over the monetary affairs of the country. Here again he several times used his reputation as a man of great wealth to rescue the treasury from embarrassment. The bank of North America was founded in Dec., 1781, with a capital of $400,000 and was of great use to the government. The looseness of the confederated bond between the states and the general poverty of the people rendered the financial management peculiarly difficult and vexatious; and it was with a sense of relief that, in 1783, Morris resigned his office. Pressed to remain he reluctantly continued his duties until the end of 1784, when a commission was appointed to examine his accounts, and he issued an address, explaining his measures and promising to fulfill all obligations undertaken by him on behalf of the government. In 1786–87 he was influential in procuring the re-establishment of the North American bank, the charter having been repealed. He was a member of the constitutional convention of 1787, and was afterward U. S. senator from Pennsylvania. He was more than once offered the office of secretary of the treasury, but refused and suggested the name of Hamilton. Unfortunate land speculations proved disastrous to his wealth; and on May 7, 1806, the man who had controlled the finances of a rising nation and by his personal exertions saved it from bankruptcy, died in a debtor's prison.

MORRIS, Robert Hunter, d. 1764; son of governor Lewis Morris; was chief-justice of New Jersey, and for 26 years a member of the council. In 1754 he was lieutenant-governor of Pennsylvania, and held the office two years.

MORRIS, Staats Long, 1728–1800; b. N. Y.; grandson of governor Lewis. He joined the British army, and in 1756 held the rank of capt.; was made lieut.col. of the 89th Highlanders, and was present at the siege of Pondicherry in India in 1761. He was brig.gen. in 1763; married the duchess of Gordon; was a member of parliament; promoted to maj.gen. in 1777, and to gen. in 1786; in 1797 was appointed governor of Quebec.

MORRIS, Thomas, 1776–1844, b. Va.; removed in 1800 to Ohio, where he began the practice of law. In 1809 he became an associate justice of the state supreme court. After a service of several terms in both branches of the state legislature, he was elected a member of the U. S. senate. Though a democrat, he did not act with the majority of his party, but was opposed to the extension of slavery, and defended the right of the opponents of slavery to have their petitions considered by congress. His independent attitude estranged his party, and lost him his seat at the next election. In 1844 he was the candidate for vice-president on the "liberty" ticket with James G. Birney. His *Life and Writings* were published by his son, rev. B. F. Morris, in 1855.

MORRIS, Thomas A., d.d., 1794–1874; b. Kanawha co., Va.; was licensed as a preacher of the Methodist Episcopal church in 1814, and joined the Ohio conference in 1816. His itinerant labors were in Ohio, Kentucky, and Tennessee, until 1834, when he was elected editor of the *Western Christian Advocate* at Cincinnati. In 1836 he was elected bishop. Ill health for several years before his death had withdrawn him from

active duty. He published sketches of *Western Methodism* and some sermons. He was distinguished for excellent judgment, and made an able presiding officer.

MORRIS, WILLIAM, one of the most powerful of contemporary English poets, was b. near London in 1834, and educated as a painter. In 1863, with several partners he founded an establishment for designing and manufacturing artistic furniture and household decorations, and has since been actively engaged in this business. His chief poems are *The Defense of Guenevere* (1858), *The Life and Death of Jason* (1867), *The Earthly Paradise*, 3 vols (1868–70), *Love is Enough* (1873), a translation of Virgil's *Æneid*, and *Sigurd the Volsung* (1877). He has also published translations from the Icelandic, *Hopes and Fears for Art* (1882), etc. He has entered warmly into the socialist movement.

MORRIS, WILLIAM WALTON, 1801–65; b. N. Y.; educated at West Point. He served, with distinction, through the Seminole war, and was with gen. Taylor in the Mexican war. He was at Palo Alto and Resaca de la Palma, and was made military governor of Puebla, in 1847. He was stationed at fort Kearney, Nebraska, 1853, and was in command of fort McHenry, Baltimore, during the rebellion. He was brevetted maj. gen. the day before his death.

MORRISA'NIA, a village of New York, in Westchester co., on the New York and New Haven railway, and about 10 m. n. of New York. It has been mostly built within the last twenty years, and is chiefly occupied by persons doing business in New York. Pop. '70, 19,609.

MORRISANIA (*ante*), was annexed to N. Y. co. in 1874. It is a station on the New York and Harlem railroad, and connected with New York by an iron draw-bridge. It contains numerous schools and an academy, 20 churches, a convent, and many fine residences. It has had a rapid growth. Pop. '80, 28,338.

MORRIS-DANCE, a fantastic dance, commonly practiced in the middle ages, and not yet wholly forgotten in England. Its origin is ascribed to the Moors. The chief performer was the *hobby-horse*, so called from the light frame of wickerwork which was fastened round his body, and supplied with a pasteboard head and neck, so as to give him the appearance of a man on horseback. Bells were also attached to his ankles, and the great art consisted in so moving the feet as to produce a rude kind of concord. The other principal actors, after a rude fashion, personified the characters of Maid Marian, the Queen of the May, Robin Hood, Friar Tuck, the Fool, etc.; and the performance was accompanied by rude music, and the clashing of swords and staves, and was the chief amusement at parochial festivals.

MORRIS ISLAND, situated at the entrance to the harbor of Charleston, S. C., 3½ m. long. It was connected with the very first overt act in the war of the rebellion, a battery at Cumming's Point, the northern end of the island, being concerned in the capture of fort Sumter, April 12–13, 1861. It was made one of the line of defenses of Charleston, fort Wagner and other batteries being erected upon it, and proved to be of great importance to the confederates. Early in July, 1863, the union forces made a descent on the s. extremity of the island and effected a landing; but the efforts immediately made to capture fort Wagner proved unsuccessful. It having been concluded to reduce this important work by regular siege, parallels were opened and approaches made, beginning July 9, with the first parallel. Five parallels were established between that date and Aug. 26; and, with the assistance of the navy, a fierce attack was opened on Sept. 5, under cover of which the approaches were pushed forward, and on Sept. 6 the fort was evacuated. The island was now employed in the siege of Charleston by the union forces, by placing powerful ordnance of long range on the n. end of the island, and using these effectually to throw projectiles into the city, 4 m. distant.

MORRISON, a co. in central Minnesota, bounded on the w. by the Mississippi river, on the n. by the Crow Wing river, drained by the Platte and Swan rivers and other streams: 1175 sq.m.; pop, '80, 5,875—3,730 of American birth. The surface is largely prairie, with a heavy growth of timber. The soil is rich, and produces large crops of Indian corn, wheat, oats, grass and potatoes. Co. seat, Little Falls.

MORRISON, a t. in Illinois, on the Chicago and Northwestern railroad; pop. '80 1,981. It is pleasantly located on Rock creek, and is the seat of Whiteside co., 124 m. from Chicago and 14 m. e. of Clinton, Iowa. It contains a court-house, 7 churches, a national bank, and 2 weekly newspapers, and derives its importance mainly from the rich agricultural and stock-raising country surrounding it. The leading industries are the manufacture of carriages, wagons, and agricultural implements.

MORRISON, ROBERT, D.D., the founder of Protestant missions in China, was b. of Scottish parentage at Morpeth, in Northumberland, Jan. 5, 1782. He studied at one of the Independent colleges, and 1805 he was sent to Macao and Canton by the London missionary society, to learn the Chinese language, and to translate the Bible into it. He reached Canton in September, 1807, and in the course of a year was appointed translator to the East India company's factory at Canton. By the year 1814 he had completed the translation and printing of the whole of the New Testament. Four years later, by the help of Mr. (afterwards Dr.) Milne, he had done the same with the Old Testament; and in 1822 he completed and printed his great *Chinese Dictionary* at an expense to the East India company of £15,000. In 1816 he acted as interpreter to Lord Amherst. In 1818

he established an Anglo-Chinese college at Malacca for English and Chinese literature, and for the propagation of Christianity. After a residence of 17 years in China, he returned to England in 1824, and brought with him a collcction of 10,000 books in the Chinese tongue. In 1826 he returned to China. In 1834 he accompanied Lord Napier to Canton as interpreter, and dicd there Aug. 1. Besides the works already mentioned, he is author of *Horæ Sinicæ* (Lond. 1812), being translations from the popular literature of the Chinese; a *Chinese Grammar* (Serampore, 1815), and *Chinese Miscellany* (1825). In 1839 his widow published *Memoirs of the Life and Labors of Robert Morrison.*

MORRISON, William, 1785–1866, b. Canada; was apprenticed to the New York fur company in 1802, and was afterwards admitted as a partner. During the twelve years of his service with the company, he explored a large part of Wisconsin and the northwest, and he is said to have been the first white man to find the source of the Mississippi. From 1815 to 1826 he managed the fur business of John Jacob Astor.

MORRISON, William R. See page 884.

MORRISSEY, John. See page 884.

MORRISTOWN, a village of New Jersey, on the Whippany river, and the Morris and Essex railway, 23 m. w. of New York, on an elevated plain, commanding a fine prospect. It has a court-house, 2 banks, 8 churches, and several literary institutions. Pop. '70, 5,674.

MORRISTOWN (*ante*), a t., the capital of Morris co., N. J., on the Morris and Essex division of the Del., Lack., and Western railroad, 32 m. w. by n. of New York. It was the head-quarters of the American army during the winters of 1776–77 and 1779–80. The traces of an old fort still exist back of the court-house, and the house occupied by Washington, having long remained in the ownership of the Ford family, is now the property of the state, and has been made a depository for many interesting revolutionary relics. The town is built on a plateau which affords beautiful views of the surrounding valleys and hills. As originally laid out there was a common in the center that was called "the green," from which in process of time the grass disappeared. After many fruitless efforts to improve it, a satirical effusion, calling it "an invisible green," led to its being inclosed and adorned. It now contains a monument to the memory of the soldiers who gave their lives to the defense of the union. The town and its environs furnish pleasant summer residences for citizens of New York, and homes for many whose business affairs call them to that city every day. Among the public buildings are a handsome court-house, a public library and lecture hall, churches of different denominations, two of them Presbyterian, the first of which is venerable among the older churches of the land, and the second admirable in the beauty of its modern architecture. In the vicinity is the new state asylum for the insane, having one of the largest and best arranged buildings in the country. Its entire length is 1243 ft., and its greatest depth, from the front of the main center to the rear of the extreme wings, 542 ft. It is built in an ornamental style of architecture, principally of light granite quarried on the spot. It has accommodations for 1000 patients, and its grounds contain more than 400 acres. Its cost was more than two millions of dollars. Pop. of M., '80, 5,418.

MORRISTOWN, a village in e. Tennessee, a junction of the East Tennessee, Virginia, and Georgia railroad, and the Cincinnati, Cumberland Gap, and Charleston ; pop. '80, 1,350. It is situated on the s. bank of the Holston river, and is the seat of two colleges, 1 a female institute. It has public schools, 6 churches, 2 weekly newspapers, and 3 hotels. It is in the center of a fertile agricultural district, which contains extensive quarries of variegated marble. The leading industries are the manufacture of flour, and of sashes, doors, and blinds.

MORROW, a co. in central Ohio; 400 sq.m.; pop. '80, 19,073—18,461 of American birth. The surface is undulating, and the soil fertile, producing good crops of Indian corn, oats, wheat, and flax. Other staples are wool and maple-sugar. Much of the surface is covered with forests and there is an abundance of sugar-maple trees. There are freestone and sandstone quarries. Vernon river, Walnut creek, and the e. fork of the Whetstone river flow through it. It is on the Cleveland, Columbus, Cincinnati, and Indianapolis railroad. Co. seat, Mount Gilead.

MORROW, Jeremiah, 1771–1862, b. Penn.; settled in the northwest territory in 1805. He was a member of the convention in 1802 which framed a constitution for the new state of Ohio. He represented that state in the lower house of congress 1803–13, and in the senate 1813–19. He was elected governor in 1822, and served till 1826. Soon afterwards he became commissioner of canals; and 1841–43 he was again in congress.

MORS, the largest island in the Lymfiord, s. of Jutland, in the kingdom of Denmark, 24 m. long, 11 m. broad; pop. 6,000. About two-thirds of the surface is a high table-land, with fertile soil; the remainder comprises bogs and marshes. The chief town is Nyekiobing, on the e. coast of the island.

MORSE, Edward Sylvester, ph.d., b. Me., 1838; educated at the Lawrence scientific school of Harvard university. In 1859 he became an officer of the Cambridge museum of comparative zoölogy, and in 1867 he was elected by the Boston society of natural history its curator of mollusca. He has been professor of comparative anatomy and zolöogy at Bowdoin college, and lecturer on zoölogy at Harvard. He is an officer of the Peabody academy at Salem, Mass., where he resides. He has written many

papers, and delivered lectures on scientific subjects, and has published *An Elementary Text Book of Zoölogy.*

MORSE, JEDIDIAH, D.D., 1761–1826; b. Conn.; graduated at Yale college in 1783; in 1784 published at New Haven a small geography, which was followed by a series of geographies and gazetteers of the United States from materials collected by traveling and correspondence with J. Belknap, historian of New Hampshire, and others. These works were very popular and had a large circulation. They were published in England, and translated into French and German. He entered the ministry in 1785; was tutor in Yale in 1786; pastor of the First Church (Congregational) in Charlestown, Mass. 1789–1820. At the close of his pastorate, having received a commission from Mr. Calhoun, secretary of war, he spent two winters in visiting some Indian tribes, of which a report was published in 1822. He was editor of the *Panoplist* 1806–11, and one of the founders of Andover theological seminary. He published, besides his geographies, *A Compendious History of New England; Annals of the American Revolution; An Appeal to the Public on the Controversy respecting the Revolution in Harvard College;* and several sermons and addresses. In 1794 he received the degree of D.D. from Edinburgh. Dr. Morse, who was eminent in the New England ministry, was much engaged in religious controversy, maintaining the old evangelical faith in New England againt the Unitarians.

MORSE, LEOPOLD. See page 885.

MORSE, RICHARD CARY, 1795–1868; son of Jedidiah; b. Charlestown, Mass.; studied at Phillips academy, Andover, and graduated at Yale college in 1812. After graduating, he spent a year in New Haven as an amanuensis in the family of president Dwight; studied theology at Andover seminary; entered the ministry in 1817. Convinced that he was not fitted for the ministry he retired from it, and engaged with his father in the preparation of his geographies; in 1823 he united with his brother Sidney in establishing the *New York Observer,* of which he was associate editor and proprietor during the remainder of his life. He wrote largely for its columns, especially translations from French and German. In 1858 he retired from active life. He died while abroad at Kissingen, Germany.

MORSE, SAMUEL FINLEY BREESE, LL.D., etc., American artist and inventor, was the eldest son of rev. Jedidiah Morse, D.D., geographer, and was b. at Charlestown, Mass., April 27, 1791. He graduated at Yale college in 1810, and visited England with the American painter, Washington Allston, to study painting with him and Benjamin West. In 1813 he received the gold medal of the Adelphi society of arts for his first effort in sculpture, the "Dying Hercules." Returning to New York in 1815, he became the first president of the national academy of design, and was appointed professor of the arts of design in the university of the city of New York. He did not give his entire attention to art, but was interested in chemistry, and especially in electrical and galvanic experiments; and on a voyage from Havre to New York, in 1832, he conceived the idea of a magnetic telegraph, which he exhibited to congress in 1837, and vainly attempted to patent in England. His claims to priority of invention over prof. Wheatstone in England have been the subject of considerable controversy. See TELEGRAPH. He struggled on with scanty means until 1843, when, as he had almost yielded to despair, congress, at midnight, and the last moments of the session, appropriated 30,000 dollars for an experimental line between Washington and Baltimore. For his telegraphic inventions, Morse was rewarded by testimonials, honors, orders of nobility, and wealth. Several European states joined in presenting him a purse of 400,000 francs, and banquets were given him in London and Paris. The well-known recording instrument is his invention. The origination of submarine telegraphy is also claimed for Morse. He died April 2, 1872.

MORSE, SAMUEL FINLEY BREESE, LL.D. (*ante*). Prof. Morse probably had his interest first awakened in the subject of electro-magnetism, through conversations with prof. J. Freeman Dana, who lectured in New York on that subject in 1826–27, and who was a personal friend. Morse first conceived the idea of the telegraph while on board the packet-ship *Sully,* on his way from Europe to America in 1832, and was led up to the conception by the then recent discovery in France of a method for obtaining the electric spark from the magnet. This fact was established by the testimony of passengers on board the ship, and by his own evidence, and that of drawings made by him at the time. Before the close of the year 1832 a portion of the apparatus which he had devised had been constructed in New York, but it was not until three years later that, in a room in the New York university building, in that city, he showed the telegraph operating with half a mile of wire. In Sept., 1837, he made a public exhibition of his discovery, and in that year filed his caveat at Washington. No tangible result following his appeal to congress for aid during that session, prof. Morse visited Europe with the hope of enlisting the interests of foreign governments in his invention. In this hope he was unsuccessful, and he returned to New York, where, and in Washington, he struggled under serious privations during the four years which elapsed before he obtained congressional aid. And after this aid had been granted, and through the means thus afforded he had succeeded in establishing a working telegraph line, he did not obtain his full reward for the service he had accomplished without tedious and expensive litigation with parties who contested his claims. The number and character of the honors heaped upon prof. Morse on account of his invaluable invention have probably never been

equaled in the case of any other American. He received gold medals from Prussia, Austria, and Würtemberg. France conferred upon him, through the emperor Napoleon, the cross of the chevalier of the legion of honor; Denmark made him knight commander of the first class of the Danebrog, and Spain, knight commander of the order of Isabella the Catholic; from Italy he received the cross of the order of Saints Maurice and Lazarus, and from Portugal that of the order of the tower and the sword. Turkey bestowed upon him, at the hands of the Sultan, the decoration of the *Nishan Iftikar*, and Yale college conferred upon him in 1846, the degree of LL.D. Public banquets were given him in London, Paris, and New York, and in June, 1871, a bronze statue of him was unveiled in Central Park.

Prof. Morse set up the first daguerreotype apparatus, and took the first daguerreotypes in America; he also laid the first submarine telegraph line (in New York harbor, in 1842); and from him, in a letter to the secretary of the treasury of the United States in 1843, seems to have come the first suggestion of an Atlantic telegraph. His death occurred about three months after his last public act—the unveiling of the statue of Benjamin Franklin, in Printing-house square, New York.

MORSE, SIDNEY EDWARDS, son of Jedidiah; 1794–1871; b. Charlestown, Mass.; graduated at Yale college in 1811; studied law in Judge Reeve's school at Litchfield, Conn.; established in 1815 the *Boston Recorder*, a weekly religious newspaper, and was for fifteen months its sole editor and proprietor. In 1817, in connection with his brother, he invented and patented the flexible piston pump. In 1820 he published a small geography, and in 1822 a larger one which was a text-book in several American colleges. In 1823 he united with his brother, Richard C., in establishing the *New York Observer*, now the oldest religious newspaper in the state. In 1839, jointly with Henry A. Munson, he produced superior map-prints by a new art which he called cerography. The first application of the art was in the preparation of maps for a school geography written by himself, of which 100,000 copies were printed and sold the first year. The process of cerography has not been disclosed. He continued the senior editor and proprietor of the *Observer* until 1858, when he disposed of his interest to the Rev. Dr. S. I. Prime, for many years his associate. Much of his time during the last years of his life was devoted to the invention of the cathometer, for deep-sea soundings, and he was preparing an essay on the subject at the time of his death.

MORSE, WALRUS, or SEA-HORSE (*trichecus*), a genus of amphibious mammalia of the family *phocidæ*, agreeing with the rest of that family—the seals—in the general form of the body and limbs, but widely differing from them all in the head, which is remarkable for the enormous development of the canine teeth of the upper jaw, and the tumid appearance of the muzzle caused by the magnitude of their sockets, and by the thickness of the upper lip. These great canine teeth form two tusks directed downwards, and the lower jaw becomes narrow in front, so as to pass between them. There are no canine teeth in the lower jaw. The incisive teeth are small, six in the upper jaw, and four in the lower, mostly disappearing from adult animals. The molars—at first, five on each side in each jaw, but fewer in the adult—are simple and not large; they have the crowns obliquely worn. The nostrils, as if displaced by the sockets of the tusks, open almost upwards, at some distance from the muzzle. The eyes are small, and the ears have no auricle, or, in popular language, there is no ear.—There is only one known species (*T. rosmarus*), sometimes called the ARCTIC WALRUS, an inhabitant of the Arctic seas and of the colder parts of the north temperate zone. It sometimes attains a size greater than that of the largest ox, and the tusks are sometimes 2 ft., or even 30 in. long; but the ordinary length of the tusks is only about one foot. The morse is a gregarious animal, and is often seen in great herds, which sometimes leave the water to rest for a while either on the ice or on the land, where, however, their movements are very awkward and clumsy, and the hunter assails them with much greater prospect of success than in the water. Hundreds have thus been killed at one time, although the adventure is not without danger, as they must be assailed with spears, their hide being thick enough to resist even a rifle bullet. The morse uses its tusks for protecting itself or young from attack, for combating with its enemy the polar-bear, for aiding it in climbing upon ice; but principally, it is supposed, for tearing sea-weed from submarine rocks; that being, there is every reason to think, the principal food of the animal, although it is supposed also to prey on mollusks, crustaceans, and other marine animals. The female morse shows great affection for her young, and will defend it to the last extremity; the young also remains beside the mother even after she is killed. When one of these animals is attacked, the rest of the herd—at least if in the water—hasten to its assistance. The morse is very capable of being tamed.—It is much sought after by the inhabitants of the most northern parts of the world for its skin, thongs of which seem to have been generally used in former times for ropes and cables—esteemed so valuable, that the Finlanders paid tribute in this article; whilst its oil—not very abundant—is employed like seal oil; and the tusks are very much valued as ivory, being superior in compactness to those of the elephant. The flesh is coarse, but is eaten by the Esquimaux. The young morse has not large tusks like the adult.

The morse has occasionally been seen on the British coasts, probably transported on icebergs from the north

The name morse is from the Russian *morss* or Lapp *morsk*. The name *walrus* is Norwegian (*hval-ros*, whale-horse). Another Norwegian name is *rosmar*, supposed to be from the Teutonic *ros*, horse, and *mar*, the sea.

MORSHANSK, a t. in the government of Tambov in Russia, 56 m. n. of Tambov, is situated on a feeder of the Oka. Pop. '80, 19,500. Morshansk is the port for shipment of corn, the shipments annually amounting in value to 5,000,000 rubles. There is also a large market for the cattle and sheep of the s.e. provinces, the average annual supply being 20,000 cattle and 100,000 sheep; also for melted grease, of which 1,500,000 rubles' worth is sent yearly to St. Petersburg and Moscow. The trade of the town itself is of little importance, the chief establishments being soap boileries, flour mills, and sail-cloth manufactories.

MORTALITY, Law of. While there are few future events the date of whose arrival is more uncertain than that of death to any one man, on the other hand, the average duration of a multitude of human lives is found to be in accordance with a law which operates as surely as that of gravitation. If it be asked how many lives must we have before we can depend on obtaining from them a duration equal to the general average, the only answer that can be given is, that the more we have the more nearly must we approach to this result; the fluctuation ultimately becoming so small as to be practically of no effect. So long ago as early in the 17th c., a certain John Graunt of London published what he called *Natural and Political Observations on the Bills of Mortality*. This work has been called "the earliest movement in economical arithmetic, and the closest approximation to the data on which life assurance is founded." About the same time, sir William Petty gave to the world many curious calculations and speculations on the same subject. In 1693 Dr. Halley published the Breslau tables of mortality, and this was the first work which really raised the subject to the rank of a science. Halley's speculations had, however, been preceded by those of Pascal in France, and of De Wit in Holland; and the latter famous man is probably entitled to be considered as the first who has applied the doctrine of probabilities to the valuation of life in the question of annuities. His treatise will be found in the second volume of the *Assurance Magazine*. Halley's tables are printed in the *Philosophical Transactions* for 1693, No. 196. In 1713 J. Bernouilli's important work was published; and in 1742 Dr. Price, availing himself of the principles laid down by Halley, and of data previously published by "John Smart of Guildhall, London, gent.," gave tables of mortality for London. In 1746 M. Deparcieux published at Paris his *Essai sur les Probabilités de la Vie Humaine*, in which he gave six valuable tables. In one of these, computed from the registers of different religious houses, it was shown, for the first time, that female life is superior to male. In 1770 appeared the first edition of Price's *Observations on Reversionary Payments*. The speculations of Buffon, Simpson, and De Moivre about the same time were of much importance. Mortality tables are tables showing the operation of the law of mortality. The correct method of framing them is by analyzing and collating accurate and sufficiently extensive statistics of life and death. They enable us to form a fair estimate of the number of human beings who will die at the end of a given period out of a given number alive at the beginning of it; and hence, the chance of life and death to the individual, and the mean duration of life at any age. Tables showing the mean duration of life have been constructed in two ways: 1st, From statistics of deaths alone; and 2d, From statistics of life and death. By the first plan, they would be deduced as follows: Suppose, on searching a parish register, that we found recorded 100 deaths of children in their first year, we should assume that, on an average, ½ a year of life would have fallen to each. This gives 50 years of life among 100. If we found that 60 had died in their second year, assigning one year and a half to each, we should have $60 \times 1.5 = 90$ years among the 60; and so on for every age up to the oldest on the register. The sum of all the years enjoyed, divided by the numbers who have enjoyed them, will give the mean duration of life from birth; and the sum of all the years enjoyed after a given age, divided by the numbers who have enjoyed them, will give the mean duration at the given age; in both cases as nearly as the data enable us to give it; but the data are insufficient. Suppose we found by a register for 1873 that 100 children had died in their first year and one man in his 96th, it is plain that, to make this ratio a fair one, there ought to have been as many births in 1778 as in 1873. If there have been only half as many born at the former date as at the latter, then we must put two lives into the calculation to make it correct; and we must proportion our results similarly at all intermediate ages. Again, suppose four deaths at age 23 to be registered, we cannot tell how many of those born in 1850 may have emigrated from one parish, nor do we know how many born elsewhere in that year may have come into it. For the rule and formula for obtaining the mean duration of life under the second method, which is an absolutely certain one, see Life, Mean Duration of. The following are the tables now most generally used by assurance and annuity offices in this country: I. The Northampton (Dr. Price's). This table was framed by Dr. Price from the register of burials in the parish of All Saints, Northampton, 1735–80. Being constructed on deaths alone, it has, as was to have been expected, proved faulty. It gives the probabilities of life too low at the younger and middle ages; and those offices which still use it—and there are a good many—have some difficulty in keeping themselves right. II. The New North-

ampton (Nos. 1 and 2). These tables were constructed by Dr. Farr. See Eighth Report of the Registrar-General for England, pp. 277–348. No. 2 is based on the deaths alone in Northampton during the seven years 1838–44. In its results it agrees almost exactly with that of Dr. Price. No. 1 was deduced from a comparison of the deaths during 1838–44 with the census returns of 1841. It differs widely from No. 2 and from Dr. Price. By the two latter, the mean duration of life is respectively found as 24.88 years and 25.18 years. By No. 1 it is 37.5 years. III. The Carlisle. This table was constructed from observations made by Dr. Heysham at Carlisle, 1780–87. It is now generally understood that the mortality in towns is understated at ages 15–35, owing to the immigration of healthy men and women from the country. Again, the female population of Carlisle was excessive during the period in question, and the extent of the observations was limited. Owing to these facts, this table gives rather too low a rate of mortality, and is a little irregular in its graduation. In a table prepared by W. T. Thomson, esq., in a Report on the Ministers' Widows' Fund of the Church of Scotland, 1861, he shows that the lives of the Scotch clergy are about half a year better up to 44 than the Carlisle; at 45, they are equal; and at 45 to 80 they are half a year worse. Thereafter they vary. The widows are half a year better up to 61, equal at 62, and nearly so to the end. Probably the Carlisle gives a fair mortality rate for a healthily circumstanced population. IV. The Government. These were computed by Mr. Finlaison on the lives of 22,000 nominees for government annuities. They are chiefly important as giving a view of the value of female life, but this view is one which differs widely from those given either by the "Experience" or by the "English" table. At age 20, for instance, the mean duration of female life is, by the Government table, 5½ years more than the male; by the Experience, it is 4 years less. In some measure this wide divergence may perhaps be accounted for by the fact that the Government results are deduced from annuitants, the Experience from assured lives. The experience of late years has, however, led to some modification in the relative values of male and female life in government tables. V. The English (Nos. 1, 2, and 3). No. 1 is deduced from the living by the census of 1841, and from the deaths at corresponding ages in the same year. See 5th and 6th Reports of the Registrar-General for England, where the tables will be found, and their construction explained. No. 2 is deduced from the living in 1841, and from the deaths in the seven years 1838–44. No. 3 is deduced from the population in 1841 and in 1851, and on the deaths for the 17 years 1838–54; male and female life being calculated separately and in combination. These "English" tables probably give the results of the average mortality of England more correctly than any others which we have. They are the result of enormous labor on the part of Dr. Farr. The observations were taken on the plan recommended by prof. de Morgan and Mr. Griffith Davies. VI. The Experience. These were prepared by a committee of eminent actuaries on the data afforded by the combined experience of 17 life assurance offices. The objections to which they are liable are, that certain lives, having been more than once assured, have appeared twice or oftener as elements in the calculations; that the average term over which the observation of the offices extends is only eight and a half years; and it is probable that the mortality which will prevail in assurance societies when they have reached maturity is somewhat understated. See letter by Dr. Farr in Appendix to 10th Report of Registrar-General, p. 11. Further, the data for old ages were deficient, and this of course affects the whole. Many curious results are brought out by this table. It shows that "town" *assured* life is superior to "country;" that female *assured* life is on the whole inferior to male; and that Irish life is worst of all. At age 20, "town" mean duration is 41 years, 2 months; country, 40 years, 4 months; Irish, 34 years, 11 months. The observations of the Standard assurance company do not, however, bear out these results; and they are doubtless so largely affected by the elements of *care in selection* as to render it impossible to found on them any conclusion of practical value. A new set of "Experience" tables was published in 1872, based on the mortality experiences of twenty offices, ten English and ten Scotch. They do not show any widely different results from the former Experience tables. These form a very valuable set of tables. They give the results of English and Scotch experience united, and of Scotch separately. See INSURANCE.

In all tables deduced from the experience of assurance and annuity societies, the fact of *selection* must not be lost sight of, either in using them for the sake of comparison, or as the basis of other tables. Actuaries, however, seem to be generally of opinion that the selection exercised by assurance societies does not really lower their rates of mortality below the general average; without selection, their rate would be above the general mean; for, it will be observed, that the public are continually selecting against the offices by offering inferior lives, and good lives often surrender their policies, while lives which have become bad hardly ever do so. Again, the value of medical examination gradually disappears, and in ten years at most it is quite lost. Five to seven years is indeed now held by the assurance offices to exhaust its value. See Minutes of the House of Commons' Committee on Assurance Associations, 1853; and Life-Contingency Tables by E. J. Farren, pp. iii.–xiii. Though female life is, as a whole, undoubtedly superior to male, yet as there are more critical periods in it, it is probable that the public may more frequently select it than male life against the societies. A valuable report on the Madras military fund (London, 1863) gives tables constructed on the mortality rates pre-

vailing among the officers, wives, and widows interested in the fund. As they have been prepared by eminent men on very ample data, they will probably be very valuable to societies transacting business in India. The following is a view of the mean duration of life, at the beginning and at each decennial period, according to some of the tables mentioned above:

TABLE SHOWING THE "MEAN DURATION" OF HUMAN LIFE, ACCORDING TO VARIOUS AUTHORITIES.

In the present article we have considered the law of mortality chiefly as it bears on insurance and other monetary transactions. The wider view of the subject, as varying with occupation and in different ages and countries, will be illustrated under the head of Vital Statistics.

MORTAR. See Cements.

MORTAR, a piece of artillery which differs from a cannon in the large diameter of its bore in proportion to its length, and in the circumstance that it is usually fired at a considerable angle, so that the projectile may strike the object aimed at in a direction more or less vertical. The object for which mortars are intended is the discharge of live shells (q.v.) or carcasses. As the projectile has a large diameter, and, except in rare instances, a very great range is unnecessary, a comparatively small charge of powder is requisite. To give this its utmost power and concentration, it is confined in a hemispherical chamber at the lower end of the bore, but of less diameter. The shell completely closes this chamber; and when the explosion ensues receives its full force on its center. In the British service the ordinary mortars range in diameter of bore from 5 to 13 inches.

Larger mortars have, however, been tried at times, as at the siege of Antwerp citadel in 1832, when the French brought one of 24 inches bore to the attack. This monster, owing to its unwieldiness and other causes, was a failure. Larger still than this, though perhaps more manageable, is Mr. Mallet's great 36-inch mortar, constructed in 1855, of iron parts welded together, and now at Woolwich, rather as a curiosity than for use. As loaded shells are of immense weight, so heavy, indeed, as in larger calibers to involve the apparatus to deposit them in their places, and the mortar is fired at high elevations, the recoil is so great and so nearly vertical that no carriage could withstand the shock; it is necessary, therefore, that the mortar should be mounted on a solid iron or timber bed, by the trunnions, which are placed behind the breech, and supported in front by massive blocks of wood. This arrangement renders the apparatus so heavy that mortars of large size are rarely used in field operations, their ordinary positions being in defensive or siege works, and in mortar-vessels.

More wieldy, however, are the Coehorn mortars, invented by the Dutch engineer of that name, for clearing the covert-way or ditch of a fortress. This mortar is sufficiently small to be managed by one man, and is accounted useful in siege or defense operations. The French use a similar Lilliputian ordnance under the denomination of pierriers, or stone-throwers. Small mortars are likewise constructed for mountain warfare; a mule carries the mortar, another the bed, and a third is laden with the projectiles. The use of mortars is diminishing at the present time, elongated shells of great weight being now thrown from rifled cannon.

MORTARA, a t. in n. Italy, 25 m. n.e. of Alessandria, and about 40 m. n.w. from the city of Pavia. It is in a fertile agricultural district, in the province of Pavia, on the Arbogna, and until recently was surrounded by fortifications and high walls, which have been removed and their place occupied by elegant villas; pop. '74, 7,408. It is the center of a number of railways and highways which give it some commercial consequence, and it contains military barracks, a theater, and good public schools. From the rice-fields in the vicinity there rises an unwholesome exhalation said to make the atmosphere unhealthy. In 774, when Charlemagne, having invaded Italy, besieged Pavia for eight

months, the expedition resulting in the eapture of Desiderius, one of the Lombards, and the downfall of their government, this eity was the scene of a bloody battle, and was conquered only when its defenders were disabled by pestilence and famine.

MORTARA, Edgar, a Jewish boy, whose case reeently attracted great and painful interest throughout Europe. The faets are as follows: On June 23, 1858, signor Momolo Mortara, a manufacturer and wholesale merchant of cloth in Bologna, and by religious profession a Jew, returning home about ten o'clock at night, found his house in the possession of the police, who informed him that they had orders from padre Felletti, inquisitor-in-chief at Bologna, to carry off his son, Edgar, who had been surreptitiously baptized into Christianity by a Roman Catholic maid-servant. The inquisitor was waited upon by some friends of the family a little after midnight, who implored delay. He informed them that he was acting under the orders of the arehbishop of Bologna, but consented to sist proeedure till "next evening." The archbishop, however, was "absent" from the eity, and next evening the papal cabineers entered the house and tore the child out of his father's arms." They carried him to Rome, where he was immured in a convent. The bereaved father immediately followed, obtained several interviews with cardinal Antonelli, and offered to prove that the servant who said she had baptized Edgar had turned out to be a worthless prostitute, living in sin with Austrian officers. The eardinal declined to interfere, on the ground that the case did not come under his jurisdiction, and recommended signor Mortara to apply to "the proper tribunals." After some weeks had passed, the child was removed to Alatri, whither his father and mother also went. and saw Edgar in a church among a number of priests, but had no opportunity of speaking to him. They returned to Rome, once more sought the presence of cardinal Antonelli, and prevailed upon him so far that he ordered the child to be brought back to the city, and allowed his parents several times to converse with him. These interviews are described as agonizing, and Edgar earnestly entreated his father and mother to take him home, but this of eourse was a hopeless request. He had been baptized, and baptism, no matter by whom administered, was an inviolable rite, which laid the Catholic church under the solemn obligation of protecting its son from the snares of parental infidelity. It dared not give him up. Signor Mortara and his wife had to go away without their child. The case soon became known throughout Europe, and excited great indignation, more particularly in England. The evangelical allianee drew up a protest, which was signed by the archbishop of Canterbury and above twenty other bishops, by a large number of peers, members of parliament, heads of colleges, and ministers of the gospel, by upwards of a hundred mayors and provosts, and by many other influential laymen. It was presented to lord John Russell. The British Jews presented another. Nothing, however, was effected by these efforts. Edgar Mortara remained, of his own eholee, the result would seem to prove, in the hands of the Roman Catholic church authorities. He was educated for the priesthood, became an Augustine monk of the monastery Notre-Dame de Beauchène, and preached his first sermon in 1874. The narrative, which created such excitement as echoed this boy's name over all the world, was at the time taken by the judicious as an *ex parte* statement; no authorized exposition of the faets, on the part of the Roman authorities, having ever been made public.

MORTAR-VESSEL, a class of gun-boat for mounting sea-serviee mortars, and in some cases provided with steam-power. The mortars are usually of the largest caliber—13 inch. To enable the mortar to be properly maneuvered, and to resist the recoil from the nearly perpendieular explosion of so great a pieee of ordnanee, the vessel has eonsiderable breadth in proportion to her length. The mortar is slung amidships in a massive bed. The ancient form of mortar-vessel was the "bomb-ketch," convenient because of the length of deck without a mast. The present vessels originated during the Russian war, and were found serviceable at the bombardment of Sveaborg.

MORTGAGE, in English law, is the temporary pledging of land in security of a debt; and as the land cannot be delivered into the creditor's hand, he aequires a hold over it by a deed called an indenture, or deed of mortgage. The ordinary form of a mortgage deed resembles an absolute eonveyance, but it contains a proviso that if the money borrowed is repaid within a certain time, then the mortgagee shall reconvey the land to the mortgagor or borrower. There is a mode of exeeuting a mortgage without any deed, whieh is eommon with bankers and others who lend money. This consists in the borrower taking the title-deeds of his land to the banker, who keeps the deeds and lends money on the faith of them. This is called an equitable mortgage by deposit of title-deeds, but in point of faet is as good as any other mortgage. Mortgage deeds do not require in England to be registered, exeept in Middlesex and Yorkshire; and hence a person not unfrequently mortgages his property two or three times over, though the security is insuffieient for all the debts. But in general this can only happen by the carelessness of one or other of the mortgagees, for the first mortgagee ought to have the title-deeds in his possession, and ought not to part with them, as they are his chief protection. A mortgagee ean assign his mortgage security to another person, who thereupon stands in his shoes. If the money is not paid at the time originally appointed in the deed, then interest beeomes due, and the deed is held as a seeurity for both principal and interest. The remedy whieh the mortgagee has if the money is not paid at all, or not paid after

due notice, is threefold. The mortgagee may exercise the power which the deed always contains to sell the estate and pay himself out of the proceeds; or the mortgagee may enter into possession and draw the rents and pay himself by installments. Or he may foreclose the mortgage, i. e., he commences a suit in the court of chancery, the effect of which is to allow a short time to the mortgageor to pay the debt, failing which the court will order it to be sold to satisfy the debt. Another remedy is for the mortgagee to sue the mortgageor for the money in an ordinary action. All these remedies may be pursued at one and the same time. Sometimes when a second and third mortagage are given over the same estate, which is often done when the estate is large compared with the money borrowed, it happens that the third mortgagee gets a prior title to the second mortgagee by buying up the first mortgage. On doing this he can tack the third mortgage on to the first by the doctrine known as the tacking of mortgages. As a general rule, if nothing is said, the mortgageor or borrower pays all the costs of the mortgage transaction. Until the estate is sold, or the security foreclosed, the mortgageor has what is called the equity of redemption, i. e., he can at any time, on payment of the debt, compel the mortgagee to reconvey the property to him. Mortgages in England are not a first-class security, and hence trustees who are not speeially authorized by their deed or will to invest in mortgage security do it at their risk, it being assumed that the only investment which is absolutely safe is government stock. In Scotland mortgages are generally called bonds and dispositions in seeurity, and form a higher and better security than in England, owing to there being a regular system of registration of deeds affecting land; and hence trustees are entitled to invest their funds there in mortgage security, whieh is considered as safe as government stoek, and less liable to fluctuations of interest. In Scotland there is no such practice as mortgaging lands with banks by merely depositing the title-deeds. See Bond, Disposition in Security.

MORTGAGE (*ante*). In early times the only way to create a mortgage under the common law was to give livery of seizure of a freehold estate, thus passing the estate to the pledgee and his heirs. Afterwards a peeuliar form of mortgage was created as an estate for years, the only right of the mortgageor being to pay the debt on the day specified, and thus clear his land of the obligation. If he failed to do this the estate was lost beyond recovery. The modern doctrine that time is not of the essence of the contract was established by equity eourts and is founded on the distinction in Roman law between *hypotheca* and *pignus;* if the property was left in the hands of the mortgageor, the law of *hypotheca* was applied; if given over to the mortgagee, the law of *pignus.* While the common law considered a mortgage as a freehold estate, equity preferred to regard it as a pledge, and, as equity is supreme within its own domain, the entire law relating to the subject has now come under the control of its courts, and the old feudal ideas have given way. Three views then might be taken—that a mortgage is an estate possessing all the eommon-law incidents except that it is not absolute until foreclosure has been had; that it is a *quasi* interest of the mortgagee in the land without those ineidents; or that it is a *pledge* (*hypotheca*) with the right of foreclosure. In every mortgage the estate and the debt or obligation are distinct, and the mortgagee cannot have seizin until the debt is due, though the decisions in some of the states seem to recognize a title before the time set for payment. Whether the assignment of the debt do or do not carry the mortgage with it is also a point on which the laws of the different states are not uniform. A conditional sale is often closely akin to a mortgage. In the latter there is a contract right of the creditor to obtain the land at some time after the non-payment of a debt which is a charge on the land; while in a conditional sale the contraet stipulates that the vendor may repurchase at a fixed price; the existence or non-existence of intention to procure a loan or obligation making the distinction. The tendency of courts is to consider such an agreement a mortgage, if there be any doubt. Where there is clearly a conditional sale intended there is no equity of redemption in the vendor after the date speeified. This, it will be seen, makes it of great importance to ascertain the true nature of the contraet. A recent case on the subjeet is that of Bassett *vs.* Bradley, reported in the last (1880) volume of the Connecticut reports.

No special form of words is necessary to create a mortgage, if it be clear that the real property is held for payment of the obligation. Wherever the statute of frauds is in force, the mortgage must conform to its provisions. As to construction, parole evidence may be reeeived to prove the existence of a condition, even though the deed seems on its face to be absolute. This, however, is allowed only when the parties have not reduced the whole of their negotiations to the form of a written contract; otherwise the usual rule as to written instruments applies. Though no special form of language must be used, yet the mortgage debt must be so described as to be intelligible to the examination of an interested party. If the obligation of the mortgage be to pay money it is almost always accompanied by a note or bond, but this is not necessary. If the obligation be to perform or not to perform a particular act, a bond should be given. If the note be lost, the loss must be set out in the pleadings, as it is the evidence of the debt which the mortgage is given to secure.

The rights and relations of the mortgageor and mortgagee are governed by the local laws of the states, the only universal rights being that of the mortgageor to pay before foreclosure, and of the mortgagee to hold the property for the debt. The provisions as

to registration and foreclosure can be learned only by reference to the statutes of each state. Where the seizin is considered as in the mortgagee, he has the right to enter at any time, and, after entry, is regarded as a tenant in possession, and liable to the mortgageor for rents or profits received. No essential change in the property can be made by the mortgageor without the consent of his mortgagee. After foreclosure the mortgagee either takes the estate or the property is sold under statute regulations to satisfy the debt. He may bring an action for his debt in a court of common law if he choose, but must do so, if at all, within the time set by the statute of limitations. The usual method of foreclosure is by bringing a bill in equity setting out all the particulars of the mortgage contract and asking that a day be appointed before which the debt must be paid or the foreclosure proceed. Notice must be given to all parties interested. If there be several mortgagees, the court will appoint a day before which the mortgageor must redeem, a subsequent day before which the last mortgageor may assume the mortgage on which foreclosure is asked, and so on up to the mortgagee who brings the petition. If payment be not made, a certificate of foreclosure is issued and recorded. If the mortgage be an absolute one, the foreclosing party acquires full title to the property; but a strict foreclosure is unusual, the law generally providing that the land or other real property shall be sold at auction, and the claims paid in order of precedence, so far as the proceeds will allow. By common law, if the sum realized will not pay the amount of the debt, the mortgagee has no further remedy, but, by the laws of most of the states, the property is appraised, and judgment given by the court of equity for the excess, though sometimes the mortgagee is sent to a court of law for remedy. The mortgagee may refuse to accept payment before the day fixed. A tender of payment on the proper day met by refusal will usually release the mortgageor, but tender after that date is of no avail. The mortgagee may be compelled by law to give a release or quit claim deed after receiving payment, and it should always be required in order to make the record of title clear. Where the mortgagee has had the right of entry, and has applied rents or profits to the payment of the debt, the mortgageor may by a bill in equity be made to account therefor; he is also liable for waste, or any act tending to injure permanently the value of the property. This follows from the doctrine of equity that the seizin has not left the mortgageor. Assessments for public improvements in most states take precedence over mortgage liens. When a mortgaged property is sold it has been held in New York that the vendee does not become responsible for the mortgage debt beyond the value of the land, unless he specially assume the lien; but this is not the case in other states. Where the mortgage and debt are held to be one, they both pass on assignment of mortgage, but elsewhere they are severed. If the mortgage is paid in full by one of two or more mortgageors, the others are compelled to contribute, and equity considers him as an assignee of the whole mortgage.

MORTIER, Edouard Adolphe Casimir Josephe, Duc de Treviso; 1768—1835; first a soldier under the republic in 1790, adj.gen. in '93, in the battles of Mons, Bruxelles, Louvain, under gen. Kleber in 1794, repulsed the Austrians on the German frontier in 1796 and retook Mayence; gen. of division in 1799, charged by Napoleon with the conquest of Hanover in 1803, made marshal in 1804, head of an army corps in 1805, distinguished for skill in making resistance to an overwhelming force of Russians at Leoben the same year, in 1806 occupying Hanover and making the siege of Stralsund; in 1807 beat the Swedes at Anclam and Friedland; and at the peace of Tilsit June 21, was made governor of Silesia and duke of Treviso. In 1808 in Spain at the siege of Saragossa, and the battles of Ocana and Gebora; in 1809–11, with the French army in the Russian campaign, received the order to blow up the Kremlin, and after the battle of Krasnoë in Nov. 1812 commanded the rear-guard in retreat; arrived at Frankfort-on-the-Main late in 1812 and participated in the bloody battles of Bautzen, Dresden, and Leipsic early in 1813; fought in retreat with Napoleon in 1814, and when the latter was beaten, and at Elba, gave adhesion to the government of Louis XVIII. On the return of Napoleon from Elba joined him, and received command of the eastern department of France. After the hundred days he was reinstated in office by Louis, became member of the chamber of deputies in 1816, and of the chamber of lords in 1819. After the revolution of 1830 he was made ambassador at St. Petersburg, grand chancellor of the legion of honor in 1831, minister of war and president of the council under Louis Philippe in 1834–35, and died by a missile from the infernal machine of Fieschi while engaged in a public review by the king's side.

MORTIFICA'TION, in Scotch law, is a term used to denote lands given for charitable or public uses. When lands are so given, they are in general formally conveyed to the trustees of the charity, to be held blench, or in feu. When mortifications are given in general to the poor, without naming particular trustees, they fall under the administration of the Court of Session. By the statute 1633, c. 6, it was declared unlawful to alter any mortifications, and the managers were rendered liable to be called to account for malversation. Any person entitled to the benefit of the fund can pursue actions of this kind.

MORTIFICATION, in Medicine. See Inflammation.

MORTIMER, Roger, earl of March, 1287–1330, also baron of Wigmore; for some years a faithful adherent of Edward II. and his representative in Ireland, but in 1320

joined the insurgent barons who were hostile to the favorite, Despensers. In 1322 Mortimer was captured at Boroughbridge and imprisoned in the Tower of London, but escaped to France. There he met and fascinated queen Isabella, wife of Edward, became her paramour, and determined upon the overthrow of the king. With a small force he landed on the English coast and was soon joined by large numbers of the discontented nobles and common people. The king was defeated, taken prisoner and soon assassinated in his dungeon. Mortimer took the title of earl of March and was given confiscated estates of great value. Edward III. was but 14 yrs. old, and though a council held the regency, Mortimer's influence was supreme. He caused the death of Kent and Lancaster, both uncles of the young monarch. The latter resolved to be king in fact as as well as name, had the earl of March seized at Nottingham castle and summoned a new parliament. Mortimer was tried on charges of treason; condemned, and in 1330 hung, drawn and quartered near Smithfield.

MORTIS CAU'SA DEED, in Scotch law, is a deed which is made with a view to come into effect on the death of the maker. Since in Scotland land cannot be conveyed by will, as in England, it is necessary to execute an ordinary deed of conveyance, and to reserve the maker's life-rent, and to keep it in his own possession until his death, i. e., to suspend its effect during the life of the granter.

MORTISE AND TENON (Fr. *mortaise*, probably from Lat. *mordere*, to bite; *tenon*, from *tenir*, to hold), a form of joint in carpentry. The tenon is a projection, generally rectangular in form, on the end of a piece of wood, cut so as to fit exactly into a deep groove (called the mortise) cut in another piece, so that the two are united at a required angle. The framing of doors, shutters, and such pieces of joinery, is usually fitted together with mortise and tenon joints.

MORTMAIN, THE STATUTES OF (Fr. *mort*, dead, and *main*, hand). The object of the statutes of mortmain is to prevent priests and others from importuning a dying man to convey his land for charitable purposes. Hence, though a person can, up to the last hour of his life, if possessing sufficient knowledge of what he does, devise by will all his land to individuals absolutely, it is otherwise if he intend to give the land to trustees for a charitable purpose, as to build a church, or school, or hospital. The statute of mortmain, 9 Geo. II. c. 36 (1736), reciting that public mischief had greatly increased by many large and improvident dispositions made by languishing and dying persons to charitable uses, to take place after their deaths to the disinherison of their lawful heirs, enacted, that in future no lands or sums of money to be laid out in land should be given to any person or body, unless such gift or conveyance should be made or executed in presence of two witnesses twelve months before the death of the donor or granter, and be enrolled in the Court of Chancery within six months after the execution. Therefore, a person on death-bed cannot in England give land, or money to buy land, for a charitable purpose. It can only be done in the life of the donor, at least twelve months before his death; and the property must be completely alienated, so that he has no further control over it. The deed must have a present operation, and must not reserve any life-interest to the donor; it must be done at once and for ever. The policy of this statute has sometimes been questioned, and several well-known modes of evading the statute have been adopted from time to time. The act has been held to apply only to land locally situated in England; and hence, if the land is situated in Scotland, or the colonies, or abroad, a will conveying it for charitable purposes will receive effect. In Scotland, the mortmain act had no application; but it was not needed, as the common law of Scotland also put a similar check on the alienation of land on death-bed, which, however, has been abolished by statute. See DEATH-BED, INTESTACY.

MORTMAIN (*ante*), the alienation of real estate to a corporation. The term, however, is generally used of religious corporations. In consequence of the feudal restrictions on alienation, a corporation was obliged to get a mortmain license to make a valid purchase of lands. One of the chief objections to the alienation of land to religious corporations, was the loss to the lord of the fee, of the ordinary feudal profits, such as reliefs, wardships, and marriages, by the vesting of land in a technical person who cannot die or suffer attaint. The license of the sovereign was necessary, as the lord to whom, in the last resort, the fee would ultimately revert. If there were an intermediate lord between the alienating tenant and the king, his license must also be obtained for the alienation; for want of of such license, the land was forfeitable to the lord, after entrance. Licenses were necessary in Saxon times, and after the conquest, they are recognized in the constitutions of Clarendon. But the church continued to increase its lands, in spite of the restriction. The estate alienated without a license reverted, in the first instance, to the immediate lord of the fee. To escape this forfeiture, the tenant made a conveyance to the religious corporation, and then held the land as its tenant; the corporation thus obtained a sufficient seizin, to enable them to enter upon the land as immediate lord, under color of a surrender or forfeiture. By the 36th chapter of Magna Charta, such conveyances were made void. The prohibition in Magna Charta applied to religious houses only, so that religious corporations sole were exempt from its provisions; and the religious houses evaded it, by buying in lands that were really holden of themselves as lords of the fee, or by taking long terms for years. To meet these evasions, the statute 7 Edw. I., *De Religiosis*, was passed.

The restrictive statutes applied to conveyances between the parties only, and the religious houses evaded them by bringing a suit to recover the land on a pretended title, in collusion with the tenant who would let the suit go by default. This kind of collusive suit came afterwards into general use under the name of a *common recovery*. The 2d statute of Westminster enacts a prohibition of this evasion, and the statute *Quia emptores*, permitting free alienation, expressly excepts alienation in mortmain. The next ecclesiastical device was to convey the land to feoffees to the use of the religious houses. The seizin thus remained in the feoffees, who were held by chancery to account for the rents and profits. This was the origin of uses and trusts. The statute 15 Richard II. declares all lands conveyed to the use of ecclesiastical persons, without the license of the king or intermediate lord, to be forfeited. The statute 23 Henry VIII. prohibited the conveyance of land for superstitious uses to non-corporate bodies also. Meanwhile it had always been possible for the crown to grant a mortmain license enabling a corporation to purchase and hold lands. At the time of the revolution, some doubts were felt in regard to the validity of such license, and by the statutes 7 and 8 William III. it was enacted that such license should henceforth be granted by the king, in his discretion. It is held that the before-mentioned statute of Henry VIII. applies to superstitious and not to charitable uses, so that a bequest to a hospital, for instance, was not voided by it. The mortmain acts have not been re-enacted in the United States except in a very few states; a corporation can hold land, but only a charitable corporation can take by devise. In some states the amount which can be bequeathed to charitable uses is limited by statute; within that limit the devise is good.

MORTON, a co. in the central part of Dakota, drained by the Missouri, which bounds it on the e., and by the Cannonball and Heart rivers. It is very scantily settled, the combined population of Morton, Mercer, Billings, and Stark counties being in '80, 1523. The surface is a rolling prairie with little wood. The Northern Pacific railroad passes through the center. Fort Abraham Lincoln and fort Rice are on the e. border.

MORTON, Fourth Earl of (James Douglas), regent of Scotland, was the second son of sir George Douglas of Pittendriech, and in 1553 succeeded, in right of his wife, Elizabeth, daughter of the third earl, to the title and estates of the earldom. He early favored the cause of the reformation, and in 1557 was one of the original lords of the congregation. Sworn a privy councilor in 1561, he was appointed lord high chancellor of Scotland Jan. 7, 1563. Having been one of the chief conspirators against Rizzio, the Italian secretary of queen Mary, on his assassination, Mar. 9, 1566, he fled with his associates to England, but, through the interest of the earl of Bothwell, soon obtained his pardon from the queen. Though privy to the design for the murder of Darnley, on the marriage of the queen to Bothwell, he joined the confederacy of the nobles against her. He was present at Carberry hill when Bothwell parted from the queen, and after Mary's imprisonment in the castle of Lochleven he was restored to the office of high chancellor, of which he had been deprived, and constituted lord high admiral of Scotland. On the death of the earl of Mar, in Oct., 1572, he was elected regent of the kingdom. His rapacity and avarice made him obnoxious to many of the nobles, and as the young king, James VI., desired to assume the reins of government, Morton resigned the regency in Mar., 1578. Subsequently obtaining possession of the castle of Stirling, with the person of the king, he recovered his authority, but was accused of participating in the murder of Darnley, and being tried and condemned, was beheaded at Edinburgh, June 2, 1581.

MORTON, Charles, 1626–95; b. England; educated at Oxford. He took orders in the English church, and was at first attached to the royalist party. He afterwards sided with the Puritans, and was obliged to give up his living in Cornwall on account of nonconformity. Soon after 1662 he opened a school at Newington Green, where Daniel Defoe was one of his scholars. To escape the persecution of the ecclesiastical courts he came to Massachusetts bay in 1686, accompanied by his pupil Penhallow, the future historian of the Indian wars. The same year, he became minister of the church in Charlestown, where he remained till his death. During a part of this time he was vice-president of Harvard college, and wrote a system of logic for use there.

MORTON, George, b. England, 1585; joined the Separatists, and settled, with his brother Thomas, at Leyden. He went over to London in 1620, where he became the agent of the Separatists. In 1623 he came to Plymouth, Mass., in the ship Ann, bringing emigrants and supplies to the pilgrims. Some years later he went back to England, where he died at a date unknown. He published in England, in 1622, a description of the Plymouth colony, under the title of *Mourt's Relation*.

MORTON, Henry, ph.d., b. New York, 1836; educated at the university of Pennsylvania. He first studied law, but afterwards took up chemistry, and in 1863 became professor of chemistry in the Philadelphia dental college. In 1869 he conducted a number of parties sent out to take photographs of the solar eclipse of Aug. 7, and the same year he took the chair of chemistry in the university of Pennsylvania. In 1870 he became president of the Stevens institute of technology, at Hoboken, N. J. He has contributed many papers to scientific periodicals, such as the *Chemical News* and the *Philosophical Magazine*.

MORTON, James St. Clair, 1829–64, b. Philadelphia; graduated at West Point in 1851, and was appointed to the engineers. After serving as assistant professor of engineering at the academy, and taking charge of various works, he went to Central America at the head of the Chiriqui expedition in 1860. In the spring of 1862 he became chief engineer of the army of the Ohio, and in the following October was appointed to the same position in the army of the Cumberland, and soon afterwards he was made brig.gen. He built the intrenchments at Murfreesboro, and was engineer of the works at Chattanooga, in whose capture he took a prominent part. In 1864 he became chief engineer of the 9th army corps in Virginia, and served through the Richmond campaign, up to Petersburg, participating in the engagements at North Anna and Bethesda church. He was killed June 17, at the head of the union assault on Petersburg. He published a number of works on engineering and fortification.

MORTON, John, Cardinal, Archbishop, 1410–1500; b. England; educated at Cerne abbey and Oxford. Through his practice in the court of arches he attracted the attention of cardinal Bourchier, who presented him to Henry VI., who made him a member of the privy council. Edward IV. also took him into favor, made him master of the rolls in 1473, and in 1478 bishop of Ely, and lord chancellor. He was not in favor with Richard III., who arrested him, and committed him to the custody of the duke of Buckingham, from whom he escaped and fled to the earl of Richmond on the continent. He is said to have suggested the union of the houses of York and Lancaster, by the marriage of Richmond with the daughter of Edward IV. Henry VII., on his accession, made Morton a member of the privy council, and on the death of cardinal Bourchier he was promoted to the see of Canterbury. In 1487 he was again appointed lord chancellor, and in 1493 pope Alexander VI. made him a cardinal. The English life of Richard III. which bears the name of sir Thomas More has been attributed to Morton.

MORTON, John, 1724–77; b. Penn.; a surveyor by profession. In 1756 he was elected to the Pennsylvania legislature, in which he served for many years, part of the time as speaker. He was a delegate to the stamp act congress, convened at New York in 1765, and for the next four years was high sheriff for Chester co., the present Delaware county. Soon afterwards he became a justice of the court of common pleas, from which he was promoted to the state supreme court. In 1774 he was elected to the continental congress, where he gave the decisive vote of his state delegation for the declaration of independence, and acted as chairman of the committee of the whole on the proposals for confederation.

MORTON, Levi P. See page 885.

MORTON, Marcus, ll.d., 1784–1864; b. Mass ; educated at Brown university, and admitted to the Massachusetts bar. He obtained a good practice, and became an active democratic politician. He served in congress, 1817–21; was a member of the state executive council in 1823; and the next year was elected lieut.-governor. He sat on the bench of the state supreme court from 1825 to 1839, when he was elected governor of Massachusetts, beating Edward Everett, the whig candidate, by one vote. He had been an unsuccessful candidate for many years for this office, to which he was again chosen in 1842. He was collector of Boston during the administration of president Polk.

MORTON, Nathaniel, 1613–85; b. England; came with his father to America in 1623. On the death of his father he was taken into the family of gov. Bradford, whose wife was his maternal aunt, and early assisted the governor in public affairs. He was secretary of the colony in 1645, holding the office till his death. He had received a good education, and almost all the records of Plymouth colony during the 17th c., which were published in several large volumes by the government of Massachusetts, were in his handwriting. He published the *New England Memoriall; or a Brief Relation of the most Memorable and Remarkable Passages of the Providence of God manifested to the Planters of New England*, etc. It was compiled mainly from the manuscripts of his uncle, William Bradford, and the journals of Edward Winslow, and included the period 1620–46. In 1680 he wrote a history of the Plymouth church.

MORTON, Oliver Perry, 1823–77; b. Ind.; the family name, Throckmorton, was shortened by his father. He was educated at the Wayne co. (Ind.) seminary, and Miami university, Oxford, Ohio; studied law, and was admitted to practice at Centreville, Ind., in 1847. He rose to be a leading member of the Indiana bar, and in 1852 was elected a circuit judge. At an early age he interested himself in politics, at first as a democrat, but became a republican on the formation of that party. He ran for governor of Indiana in 1856 on the republican ticket; was defeated, and returned to the practice of law; but in 1860 was elected lieut.-governor of the state; the governor having been chosen U. S. senator, Morton became governor, Jan. 16, 1861. The beginning of the rebellion found the state legislature and the attorney-general of Indiana democratic, and thus a fierce and active opposition against furnishing aid for the prosecution of the war. Gov. Morton, who gained the sobriquet of "the great war governor," devoted himself, heart and soul, to plans for placing Indiana strongly on the side of the union, and even effected a sufficient loan on his personal responsibility to meet the exigencies of the situation: this obligation was afterwards assumed by the state. In 1864 he was elected governor by a large majority; but in the following year experienced a stroke of paralysis, and was obliged to go to Europe for his health. He was absent only a few

months, and on his return resumed the duties of his office. In 1867 he was elected to the U. S. senate; and on the expiration of his term, in 1873, was re-elected for the term ending in 1879. In the senate he became the recognized leader of the republican party, while he accomplished a prodigious amount of labor, serving on the committees on foreign relations, agriculture, military affairs, private land claims, and privileges and elections. He was one of the principal promoters of the passage of the fifteenth amendment to the constitution, and sustained the administration in the effort to carry through the senate the proposed San Domingo treaty. For this last service he was offered the English mission, which he declined on the ground that his acceptance would involve the election of a democratic senator in his place by the legislature of Indiana. At the republican national convention in 1876, senator Morton received 124 votes on the first ballot for president. He was a member of the electoral commission called to decide the question of the disputed presidential election; and afterwards strongly pressed an amendment to the law directing the method of counting the votes. Senator Morton was a man of powerful intellect and determined will, and an orator of great popularity through his vigorous and straightfoward speech. During the latter part of his life his infirmities neeessitated his use of assistance in moving about, and he had to be carried from the lobby of the senate chamber to his carriage. In his prime he was over 6 ft. in height, with a powerful physique.

MORTON, Perez, 1751–1837; b. Mass.; graduated at Harvard in 1771, and was admitted to the Boston bar. He pronounced the eulogy on gen. Joseph Warren, April 8, 1776. He was speaker of the state legislature, 1806–11, when he was elected state attorney-general, which office he filled with distinction till 1832. He married Sarah Wentworth Apthorp, formerly well-known as a writer of verses.

MORTON, Samuel George, M.D., American physician and ethnologist, son of an Irish emigrant, was b. in Philadelphia, Jan. 26, 1799. He studied medicine in Philadelphia, Edinburgh, and Paris, and in 1824 settled in Philadelphia, where he contributed papers on physiology and craniology to scientific journals. In 1834 he visited the West Indies, and made observations on the development of races. In 1839 he was appointed professor of anatomy in the Pennsylvania medical college, and published his great work, *Crania Americana*, based on his collection of 867 classified skulls. In 1844 he published *Crania Ægyptiaca*, based on the collection of George R. Gliddon, esq.; and in 1849 his last work, *An Illustrated System of Human Anatomy, Special, General, and Microscopic.* He died at Philadelphia, May 15, 1851. Morton may be regarded as the first American who endeavored to place the doctrine of the original diversity of mankind on a scientific basis. See the memoir of Morton prefixed to Nott and Gliddon's *Types of Mankind* (Philadelphia, 1854), a work largely illustrated by selections from his unedited papers.

MORTON, Sarah Wentworth Apthorp, 1759–1846; b. Mass.; married in 1781 to Perez Morton (q.v.). She acquired considerable reputation by her verses contributed to the *Massachusetts Magazine* over the signature of "Philenia." Under that pseudonym she published at Boston, in 1790, *Ouâbi, or the Virtues of Nature; an Indian Tale, in 4 cantos.* This work was followed in 1797 by *Beacon Hill*, a poem in 5 cantos; and in 1823 by *My Mind and its Thoughts*, a mixture of verse and prose pieces.

MORTON, Thomas, 1590–1646; b. England; a lawyer and member of Clifford's inn, London. He came to this country with Weston's colony in 1622. He soon returned to England, but came to Massachusetts bay with Wollaston in 1625, and took up his residence at Mount Wollaston, now a part of the town of Braintree. Morton called his settlement "Merry Mount," set up a may-pole there, and very much scandalized the Plymouth people by his merry-making. A small party came up from Plymouth in 1628, cut down the may-pole, took Morton to Plymouth, and sent him thence to England. Morton ventured to return in 1629, but was again sent home, and the next year his house at Wollaston was demolished. Morton, however, came once more to Massachusetts in 1643, and was imprisoned for a year by the authorities on account of his "scandalous book," *The New England Canaan*, which he had published in England in 1632. This work contains a valuable account of the condition of Massachusetts, mingled with amusing satire on the Puritans. The late J. L. Motley made Morton the subject of two novels, *Morton's Hope* and *Merry Mount.*

MORTON, William Thomas Green, 1819–1868, b. Mass.; commenced studying dentistry in Baltimore in 1840, continued there for 18 months and settled in Boston. He is, more than for anything else, known as the introducer and discoverer of the surgically useful anæsthetic properties of sulphuric ether. His attention was first called to the subject in 1844 when attending lectures at the medical college in Boston, and after some experiments performed upon himself, he administered the ether to a man Sept. 30, 1846, and extracted a firmly rooted tooth without pain.* He repeated the operation, and making known the results to Dr. John C. Warren, he administered ether at the latter's request in the Massachusetts general hospital, Oct. 16, 1846, to a man for the operation of removing a tumor from the jaw. Dr. Morton obtained a patent for the use of ether, under the name of "letheon," in 1846, a month after the operation in the hospital, and a month after this, in England Dr. C. T. Jackson also claimed the honor of having made the discovery, and the Moynton prize of the French academy was

equally awarded to Dr. Morton and to Dr. Jackson, but Dr. Morton declined to accept it, which resulted in his receiving in 1852 the large gold medal, the Moynton prize in medicine and surgery. He claimed compensation from congress for his invention, the government having used it, and also from individuals, and he was involved in many suits. He received, however, no compensation, and his life was spent in contests, literary, and legal, in regard to his invention. Memorials were presented to congress signed by many physicians, but for one reason or another they failed to secure what was asked. His latter years were spent upon a farm at Wellesley, Mass. where he d., from an affection brought on by reading an article which sought to deprive him of the merit of his discovery.

MOSA'IC, the art of producing artistic designs by setting small square pieces of stone or glass of different colors, so as to give the effect of painting. Both the origin of the art, and also of its name, are buried in obscurity; it was, however, much practiced by the ancient Romans, especially for ornamental pavements, specimens of which are almost always found whenever the remains of an old Roman villa are discovered. Under the Byzantine empire; it was also much used for the ornamentation of churches, in which it formed a large portion of the wall-decoration. It was re-introduced into Italy for the latter purpose about the middle of the 13th c. by Andrea Tafi, who learned it of some Greek artists employed at Venice in decorating St. Mark's. Since then it has been especially an Italian art, and to such wonderful perfection has it been brought, that most minute pictures are produced by it. Within quite recent years; mosaics of surpassing, beauty both in design and material, have been produced by Russian artists in the Imperial glass manufactory of Russia: those shown in the Russian department of the international exhibition (1862) have probably never been surpassed. The pieces of glass of every shade of color are technically called *smalts;* they are generally opaque, and are set in cement in the same manner as tiles or pavement. Some fine pieces of mosaic pavement have lately been produced in this country by Messrs. Minton & Co. of Stoke-upon-Trent, and by Messrs. Maw of Brosely, proving that the art only wants sufficient encouragement to obtain a high position. In Italy there are two very distinct varieties of mosaic work—i.e., the Florentine and the Roman; the former is entirely formed of pieces of stone or shell of the natural colors, and is limited in its application chiefly to floral and Arabesque designs. The later is made of the glass smalts mentioned above, and has so wide an application, that most of the finest paintings of the best old masters have been copied in mosaic, and the pictures so taken form the almost imperishable decorations of the finest churches of Italy. The manufacture of the opaque glass or smalts for making the little square pieces called tesseræ of which the pictures are composed, is a very important one, and is carried on in the Vatican, where 25,000 shades of the various kinds of colored glass are produced.

MOSAIC GOLD. See TIN.

MOSAIC WOOL, or WOOL MOSAIC, is a remarkable application of the principle of mosaic-work to the production of woolen or worsted rugs and carpets, having a definite design or pattern, independent of the ordinary processes of printing and weaving. Many attempts in this direction have been made, chiefly on the continent; but the most successful is that of Messrs. Crossley, in whose extensive carpet factory at Halifax the mosaic wool is produced as a regular department of manufacture.

In the first place, well-spun worsted threads are dyed to every color and almost every shade or tint, amounting to a hundred varities in all. An artist prepares a full-sized drawing of the pattern or design, ruled all over with cross-lines; this is copied on lined paper by girls, each of whom takes as much of the pattern as will fill a square foot. A workman (or woman) having a good eye for color, examines each square piece of drawing in detail, and selects the proper color of thread suitable to every portion of it; the threads are a little over 200 in. long each, or about 17 ft., and are numerous enough to pack closely together into a mass of one sq. ft. in width and depth. A strong iron framework, 17 ft. long, is so arranged that all these threads can be stretched on it horizontally, tied at one end, and weighted with 4 lbs. to each thread at the other. Girls, under the direction of the workwoman who selects the colors, arrange these threads one by one, tying them at one end, weighting them at the other, and supporting them on a steel bar in the middle. This being done, the mass of 17 ft. in length is cut up into blocks of 20 in. long each, for convenience in after-operations. All these processes are for one sq. ft. only of the pattern, and they have to be repeated as many times as there are sq. ft. in it. Supposing a rug 6 ft. by 2, with a lion, tiger, or other device occupying the greater part of the surface: there must be 12 masses prepared, and as each mass contains 50,000 threads, there will be 600,000 altogether. Blocks are cut from each mass, and are placed in an iron box or frame, side by side; thus forming a quadrangular solid 6 ft. by 2, and 20 in. deep, with the threads arranged *vertically*. Now, to convert this into a great number of separate rugs, the pattern of which is seen represented on the upper surface, formed by the ends of the colored threads, india-rubber is dissolved in camphine to the consistence of carpenter's glue, and brushed well over the top, so that every individual thread shall receive its portion; this being dried, a second coating is applied; and afterwards a third. A backing of canvas, or of some kind of strong cloth, is cemented down upon the mass of threads by a glue of the same kind, and is scraped

and rubbed until it adheres to every individual fiber. When dry, the mass of threads is raised up three-sixteenths of an inch, by a screw acting upon a movable bottom to the box. A very keen circular cutter, 12 ft. in diameter, and rotating 170 times per minute, quickly severs a horizontal slice three-sixteenths of an inch thick, the box of threads being caused by an endless screw to travel onward to meet the cutter. This slice when turned up, presents the picture complete, in a beautifully soft nap, or pile of woolen threads, supported by a canvas or woolen backing. It is a mere question of hand-work to convert this into a rug, carpet, coverlet, or wrapper of any kind. A second repetition of the same processes converts another slice into a second rug; and so on, until the mass of 20 in. in depth has been cut up into about a hundred slices, each forming one rug. As the blocks of 20 in. were originally cut from a mass of 200 in., the whole mass produces about a thousand rugs, all exactly the same pattern. It is this power of repetition which makes the process pay; for the great preparatory labor of selecting and arranging (say) 600,000 distinct threads could not otherwise be compensated for.

MOSAYLIMA (Little Moslem), one of the most important rivals of Mohammed, belonged to the clan Dûl, a division of the tribe of the Bani Hanifah, of Yamâma in Nedjed. The traditions about his life and age are extremely contradictory and legendary. It appears, however, tolerably certain that he had risen to a certain eminence in his tribe, probably as a religious teacher only at first, before Mohammed assumed his prophetical office. The name he was known by among his friends was Rahmân, the Benignant or Merciful; a term which Mohammed adopted as a designation of God himself. This word, which is Aramaic, was a common divine epithet among the Jews, from whom Mohammed took it, together with a vast bulk of dogmas, and ceremonies, and legends. If, however, Mosaylima, as is supposed by some, assumed that name in the meaning of Messiah, Savior, it would prove that he had anticipated Mohammed in the apostleship, which is commonly denied. It was in the ninth year of the Hedjrah that Mosaylima, at the head of an embassy sent by his tribe, appeared before Mohammed, in order to settle certain points of dispute. The traditions are very contradictory on the circumstance whether or not Mosaylima was then already the recognized spiritual leader of his tribe. When they were introduced to Mohammed in the mosque, they greeted him with the orthodox salutation of Moslems—viz., "Salâm alayk" (Peace upon thee), and after a brief parley, recited the confession of faith. Shortly after this event, Mosaylima openly professed himself to be a prophet, as well as Mohammed. The latter sent a messenger to him, as soon as he heard of this, to request him to reiterate publicly his profession of Islam. Mosaylima's answer was a request that Mohammed should share his power with him. "From Mosaylima, the apostle of God," he wrote, according to Abdufeda, "to Mohammed, the apostle of God. Now let the earth be half mine, and half thine." Mohammed speedily replied: "From Mohammed, the apostle of God, to Mosaylima, the liar. The earth is God's: he giveth the same for inheritance unto such of his servants as he pleases, and the happy issue shall attend those who fear him." Yet notwithstanding these testimonies, of probably late dates, it seems, on the other hand, perfectly certain that Mohammed made very great concessions to his rival—concessions that point to his having secretly nominated Mosaylima his successor, and that he by this means bought Mosaylima's open allegiance during his lifetime. It was not a question of dogmas, though they each had special revelations, but a question of supremacy, which was thus settled amicably. "Mohammed," Mosaylima said, "is appointed by God to settle the principal points of faith, and I to supplement them." He further had a revelation, in accordance with Mohammed's: "We have sent to every nation its own prophet," to the effect: "We have given unto thee [Mosaylima] a number of people; keep them to thyself, and advance. But be cautious, and desire not too much; and do not enter into rival fights."

When Mohammed was at the point of death, he desired to write his will. Whatever he may have wished to ordain, is uncertain; it is well known, at all events, that his friends did not obey his order, and refused to furnish him with writing materials, very probably because they did not like to be bound by his last injunctions. Sprenger supposes that he wished formally to appoint Mosaylima his successor, and that it was just this which his surrounding relations feared. Mosaylima then openly declared against Islam, and many parodies of the Koran sprang up in the Nedjed, ascribed to him. In the 11th year of the Hedjrah, it at last came to an open breach between the two rival powers. Abu Bekr, the caliph, sent Khalid, "the sword of the faith," with a number of choice troops, to compel Mosaylima to submission. Mosaylima awaited the enemy at Rowdah, a village in the Wadi Hanifah. So formidable indeed was Mosaylima's force, that Walid is said to have hesitated for a whole day and night before he undertook an assault unanimously disapproved of by his council. On the second morning, however, he advanced, and in a battle which lasted until the evening, contrived, with fearful losses of his own, to gain the victory. Mosaylima fell by the hands of a negro slave, and his head was cut off by the conqueror, and placed at the head of a spear, to convince both friends and foes of his death. Khalid then advanced to the slain prophet's birthplace, in order to slay all its inhabitants. They, however, by a clever stratagem contrived to conclude an honorable peace, but had to embrace Islam. The Mosleymian "heresy" was thus stamped out, and only a few scattered remnants of the new faith

contrived to escape to Hasa and Basrah, where they may have laid the foundation of the later Karmathian creed.

It is extremely difficult to come to any clear notion of Mosaylima's real doctrines, as all the accounts that have survived of them come from victorious adversaries—adversaries who have not hesitated to invent the most scandalous stories about him. Thus, a love-adventure between Mosaylima and the prophetess Sajâh, the wife of a soothsayer of Yamâma, who is supposed to have stayed three days in his tent, is told with great minuteness, even to the obscene conversation that is supposed to have taken place between them during that time; the fact being that this story, which is still told with much relish by the natives, is without the slightest foundation. From the same source, we learn that Mosaylima tried to deceive his followers by conjuring-tricks. It seems, on the contrary, that Mosaylima was of much higher moral standing than Mohammed himself. Thus, he is said to have enjoined the highest chastity even among married people: unless there was hope of begetting children, there should be restriction of conjugal duty. Even the nickname, "Little Moslem," given to him seems to indicate that he, too, preached the unity of God, or Islam, as the fundamental doctrine of faith. How far his religion had a socialist tendency, and offered less show of dignity and outward morality to its followers, or whether it rejected fatalism, contained an idea of incarnation, and invested its preachers and teachers with a semi-mediatorial character, as the latest explorer of the Nedjed, Mr. Palgrave, tells us we have no means of judging. But we must receive these conclusions, probably drawn from the information of the natives, with all the greater caution, as that story of the prophetess Sajâh, whom he reports, after his informants, not only to have been properly married to Mosaylima, but to have, after his death, become a devout partisan of Islam, and to have entered an "orthodox alliance," does not, as we said before, deserve the slightest credence.

MOSBY, John Singleton. See page 885.

MOSCHELES, Ignaz, 1794–1870, b. Prague; studied music under Dionysius Weber at the Prague conservatory, and at the age of 11 was the best pianist in Prague, and had begun to compose. In 1808, he went to Vienna, where he met Beethoven and Haydn, and took lessons from Albrechtsberger, who had been Beethoven's teacher. He soon won a reputation in concert, and disputed with Hummel the honor of being the first pianoforte player in Germany. After a tour of Germany, Holland, and France, he visited England, which was his residence till 1846. From 1825, he was professor in the London academy and conductor of the philharmonic concerts. The music of Beethoven was almost unknown in England at that time; and Moscheles, by his rendering of the sonatas and concertos of that composer, made the pianoforte a fashionable instrument. He was the most successful teacher, in his day, in England; but many later pianists, as most notably, Liszt and Thalberg, have surpassed him in execution. In 1846 he became professor at the conservatory at Leipsic. His own compositions are additions to classical music, and his compositions for other instruments than the piano show a profound theoretical knowledge. He published with notes, an English translation of Schindler's *Life of Beethoven.*

MOSCHI, a people of Asia living s. of the Caucasus. According to Pliny they dwelt around the sources of the Phasis, between the Euxine and Caspian seas. At the time of Augustus their territory is said to have been divided between Colchis, Armenia, and Iberia; and from them a mountain range extending from the Caucasus to the Anti-Taurus was called the Moschic mountains. Their name by early writers is often coupled with that of the Tibareni, and the two people are generally identified with the Meshech and Tubal of Scripture.

MOSCH'IDÆ, or (recently) Mosch'inæ. See Musk deer, *ante.*

MOS'CHUS, a bucolic poet who lived in Greece in the 3d c. B.C., and whose writings are classed with those of Bion who was his master. The two writers are published together in a translation in Bohn's *Classical Library.* He wrote in the Doric dialect, and all his works that have been preserved are fragmentary, idyllic, and pastoral in character, but much admired by scholars.

MOSCOW, an important government of Central Russia, lies s. of the governments of Tver and Vladimir. Area, 12,552 sq.m.; pop. '80, 1,938,358. The surface is level with the exception of a tract in the s.w., which is elevated. It is watered by the Moskva and the Kliazma, while the Oka forms a portion of its southern boundary. The soil, principally clayey, with some sandy and stony tracts, is on the whole, unfertile, and barely supplies local consumption. Few of the governments of Russia, however, equal that of Moscow in manufactures and general industry. In contains numerous cloth, silk, brocade, chintz, paper, and other factories. China-ware is manufactured from the clay dug up in the district of Gjelsk. Many of its villages carry on special branches of manufacture, of which pins, glass beads, and small looking-glasses for Asia is one. White limestone is quarried, and is much used for building in the capital; yellow marble quarries occur on the banks of the Oka. Peat is extensively used as fuel in the factories. Among the places historically celebrated are the monastery of St. Sergius, founded by one of the first Muscovite princes, and famous for its silver shrine, said to be the richest in the world; and the village of Borodino (q.v.).

MOSCOW (Russ. *Moskvá*), the ancient capital of Russia, and formerly the residence of the czars, is situated in a highly-cultivated and fertile district on the Moskva, 400 m. s.e. of St. Petersburg, with which it is in direct communication by railway. Lat. 55° 40′ n., long. 37° 33′ east. Pop. '71, 601,979. Previously to its being burned in 1812, Moscow was perhaps the most irregularly built city in Europe, and that distinction to a great extent it still retains; for, as the main object in 1813 was to build speedily, the streets rose again on the old model, undulating and crooked, and consisting of alternating houses, the most varied in character and pretensions. Many improvements have, however, been recently accomplished in the city. Gas pipes have been laid along the streets; letter-boxes are placed at frequent intervals; the Romanzoff place, formerly so dirty, has been converted into a splendid square, with an ornamental garden, and the old obelisk, the former monument of the place, standing in the center, with water fountains on each side. The general view of the town, especially that obtained from an eminence on its southern side called the Sparrow hills, is eminently original and picturesque. Its hundreds of churches and convents, surmounted by gilt and variously-colored domes; its gardens and boulevards; and, above all, the high walls and crowded yet stately towers of the Kreml or citadel, produce a most striking effect. The Kreml, situated on the northern bank of the river, forms the center of the town, and around it, with a radius of about a mile, is a line of boulevards, extending, however, only on the n. side of the river. Outside of this line, and concentric with it, is another line of boulevards, with a radius of a mile and a half; while beyond all, and forming the girdle of the city, is the outer rampart, with a circumference of 26 English miles. The Kreml comprises the principal buildings, as the cathedral of the Assumption of the Virgin, founded in 1326, a small but gorgeously-decorated edifice; the cathedral of the archangel Michael, containing the tombs of all the czars down to the time of Peter the great, who changed the royal burial-place to St. Petersburg; the church of the Annunciation, the floor of which is paved with jaspers, agates, and carnelians of various shapes; the tower of Ivan Veliki 200 ft. in height, and surmounted by a magnificent gilded dome, from which, as from all the domes of Moscow, rises the "honorable cross;" the Czar Kolokol (king of bells), the greatest bell in the world; several palaces, and collections of ancient arms and other antiquities; the arsenal, surrounded by the splendid trophy of 850 cannons, taken from the French; and the senate. The walls of the Kreml are surmounted by 18 towers, and pierced with 5 gates. In the town, the chief buildings are the cathedral of St. Vassili, remarkable for its peculiar architecture; the Gostinoi Dvor, or bazaar; and the exchanges. The temple of the Savior, which was commenced in 1812, to perpetuate the memory of the repulse of the French invasion, was finished in 1881. It is resplendent with gold and marble; the gilding of the five cupolas alone cost 100,000 silver roubles. The university of Moscow, the first in Russia, founded in 1753, is attended by 1800 students, and contains a library of 160,000 volumes, museums of natural history, and a botanical garden. As intermediate educational establishments between the parish schools and the university, there are provided 5 high schools or gymnasia for males, and 3 for females; special establishments are the technological, the agricultural, the oriental, 2 commercial, and 3 military schools. There are several learned societies in Moscow, which is also the seat of a metropolitan, one of the three highest dignitaries of the Russian church. The public museum and library, which was removed from St. Petersburg in 1861, occupies a large and handsome building, formerly a palace, is rich especially in ancient Slavonic MSS., and has about 200,000 volumes.

Moscow communicates by railway with St. Petersburg, Nijni-Novgorod, Koslov, etc. It is the seat of an extensive manufacturing and commercial industry; it imports largely, and carries on a considerable export trade, especially with Asia. Its trade is chiefly in hides, leather, oils, wool, grease, isinglass, wax, honey, feathers and down, potass, soap, iron, and copper; cotton from Asia, silks from Georgia, Persia, and Bokhara; Caucasian madder, home and Turkish tobacco, furs, tea, chemicals, and all the products of Russian manufacture, of which Moscow is the actual center. The chief manufactures are woolen and worsted goods, silks, brocades, dyeing, printing, tanning and skin-dressing, iron, copper, and silver works, and chandleries.

Moscow is of ancient origin for a Russian town. Its site was bought by Yuri Dolgoruki, in the 12th c., and a fortress built. In the 14th c. not only had it become the capital of the Russian religious world, owing to the residence there of the metropolitan, but it had also become the actual capital of Muscovy. In 1368, 1370, and 1372, it suffered from the inroads of the Lithuanians; in 1381 it was sacked by the Tartars. From 1415 to 1501 it was, on four separate occasions, partially destroyed by fires; and it was burned to the ground by Devlet-Girey, khan of the Crimean Tartars, in 1571. It was taken by the Poles in 1610, and remained in their possession till their expulsion by the Russians under Minin and Pojarsky in 1612. In 1682, 1689, and 1698, it was the theater of the revolts of the Strelitz. In 1812, from Sept. 14 till Oct. 24, it was in the hands of the French.

MOSCOW (*ante*). The present population of Moscow is (1880) 611,970. Its growth within the past 30 years has been more rapid than at any former period, and it has become the center of the Russian system of railways. Though the newer parts have added boulevards, wide avenues, parks, and stately architecture to the attractions of the

old city, it is the picturesqueness of the Kremlin, its aggregation of old and new palaces, its fortified walls and lofty towers, its churches, mosques, monasteries, domes, spires, and minarets, forming from a distance perhaps the most remarkable architectural scene in the world, that is still the greatest attraction of Moscow; and is even heightened in its effects by contrast with the old narrow and tortuous streets, their mingled poverty and magnificence, with the open, airy, and polished beauty of the new. Moscow is said to exceed in area any European capital except London and Constantinople. It is 466 m. s.e. of St. Petersburg, and 900 m. e. of the extreme westerly part of the empire.

MOSELEY, Henry, d.d., 1802–72; b. England; educated at Cambridge. He was for a number of years professor of natural philosphy and astronomy in King's college, London. He had already taken holy orders, and in 1853 was appointed canon of Bristol cathedral. He was afterwards presented to the living of Olveston, and made chaplain to the queen. He was a member of the school-board for many years. He published a number of scientific books, including a *Treatise on Mechanics Applied to the Arts*, and *Mechanical Principles of Engineering and Architecture*.

MOSELLE (Ger. *Mosel*), an affluent of the Rhine, rises in the Vosges mountains, France, at an elevation of 2,260 ft. above the level of the sea, not far from the sources of the Saône. Its course is north-westerly as far as Pont-à-Mousson, in the department of Meurthe, where it becomes navigable; then n. to Thionville, near the French frontier; after which it proceeds in a north-easterly direction (latterly, with many zigzag picturesque windings) through Luxemburg and Rhenish Prussia, joining the Rhine at Coblentz. On its way it passes the towns of Remiremont, Epinal, Toul, Pont-à-Mousson, Metz, Thionville, and Treves. From Metz to Treves it flows through a broad valley, inclosed by rounded vine-bearing hills. Its entire length is upwards of 330 miles. Its principal tributaries are the Meurthe, the Seille, and the Sarre on the right, and the Orne, the Sure, and the Kyll on the left. The wines grown in the basin of the Moselle are noted for their lightness and their delicate aromatic flavor. The inferior kinds are liable to acidity.

MOSELLE was formerly a frontier department in the n.e. of France, but the greater part of it was taken by Germany after the war of 1870–71. The small portion left to France was joined to the department of Meurthe. Population of Moselle in 1866, 452,157. It is watered by the Moselle and its tributaries; is richly wooded, and yields abundance of grain, fruits, and wine, though the last is of an inferior quality. Agriculture is in an advanced condition; roads are numerous, and the river navigation important. Coal, iron, and building-stone are the most valuable minerals. There are also linen, woolen, leather, glass, papier-mâché, and other manufactures.

MOSELLE WINES. See German Wines.

MOSENTHAL, Salomon Hermann, b. 1821, in the Prussian province of Hesse; a German dramatist, chiefly known by the dramas *Deborah* and *Sonnenwendhof*, which have been represented with success, and translated into English, Danish, Hungarian, and Italian.

MOSER, George Michael, 1705–83; b. Switzerland. At an early age he went to London, and became a gold-chaser. To this he at length added enamel painting, chiefly for lockets and watch cases, and won the notice and commendation of sir Joshua Reynolds. He was one of the founders and first keepers of the Royal academy, in which last capacity he was superintendent of the students in drawing from the antique.

MOSER, Johann Jakob, 1701–85; b. Germany; made professor extraordinary of law at the university of Tübingen in 1720. Six years later he became councilor at Stuttgart, and in 1727 he became ordinary professor of law at Tübingen. He resigned this chair on account of a quarrel with his colleagues, and for the same cause left the directorship of the university at Frankfort-on-the-Oder. He was engaged for many years in the preparation of his most important work, on the *Public Law of Germany*, and other legal books. He afterwards opened an academy in Hanover, where the sons of the nobility were taught public affairs.

MO'SES (Heb. *Môsheh;* LXX. and Vulg. *Moyses;* ? Egypt. *Mes* or *Messou;* Copt. *Mo-ushe*, i.e., drawn out of the water), prophet and legislator of the Israelites, born about 1600 b.c. in Egypt (? Heliopolis), during the period of their hard bondage. His father was Amram, his mother Jochebed, both of the tribe of Levi. The tale of his birth and early education has, by tradition (Manetho, Philo, Josephus, Midrash, etc.), received a much more extraordinary legendary character than is found in Exodus; while the main features are, on the whole, the same in them all. And there is no reason to doubt the truthfulness of an account which shows us Moses, like many other supreme benefactors and "suns" of mankind, struggling against an apparently adverse fate, nay for very life, from the instant of his birth. The well-known narrative, to which late traditions (contained in Philo, Josephus, the Fathers, etc.) have supplied questionable names and dates, is that Moses's mother, unable to hide the child—which was to have been drowned at its birth—longer than for the space of three months, put it into a basket of papyrus, and hid it among the Nile rushes, Miriam, his sister, watching it from afar. The king's daughter (Thermuthis, or Merris?), coming down to the river, observed the weeping child, and was so struck with its beauty that she allowed Miriam to fetch a Hebrew nurse, Joche-

bed. Grown up, he was sent to the king's palace (Heliopolis) as the adopted son of the princess, and here seems to have enjoyed not only princely rank, but also a princely education. He is also said to have become a priest, under the name of Osarsiph or Tisithen, and to have been a mighty adept in all the sciences of "Egypt, Assyria, and Chaldea;" to have led Egyptian armies against the Ethiopians, defeated them, and pursued them to their stronghold, Saba (Meroe); this place being delivered into his hands by Tharbis, the king's daughter, whom he subsequently married. The Bible contains nothing whatever about the time of his youth. He first reappears there as the avenger of a Hebrew slave, ill-treated by an Egyptian overseer. Threatened by the discovery of this bloody act, he escapes into Midian, where he is hospitably received by Jethro, the priest, and married his daughter, Zipporah. He stayed for many years in Midian, tending the flocks of his father-in-law. This most sudden transition from the brilliant and refined life of an Egyptian court, of which he had been brought up a prince, to the state of a poor, proscribed, exiled shepherd, together with the influences of the vast desert around him, must in Moses's mind have produced a singular revolution. The two names which he gave to his sons, strikingly express part of what filled his soul—a feeling of gratitude for his salvation from the avenging hand of justice, and the deep woe of his exile. The fate of his brethren went now to his heart with greater force than when he was a prince and near them. There rushed upon his memory the ancient traditions of his family, the promises of Jehovah to the mighty sheikhs, his forefathers, that they should become a great and a free nation, and possess the ancient heritage of Canaan; why should not he be the instrument to carry out this promise? The *Ehye asher Ehye* (I am that I am) appeared to him while his mind was occupied with such thoughts, and himself put the office upon his shoulders. A new king had succeeded in Egypt, his old enemies were either dead or had forgotten him, and Moses returned to Egypt. Together with Aaron, his brother, the man of small energy but of fine tongue, he consulted about the first steps to be taken with the king as well as with their own people—both of whom treated them at first with suspicion, nay, with contempt.

After ten distinct plagues (more or less akin to natural phenomena peculiar to Egypt), the last being the death of all the firstborn, Pharaoh consented to let his slaves go free, "that they might serve their God." Moses very soon had occasion to prove that he was not only the God-inspired liberator of his people, who in the enthusiasm of the moment had braved the great king and his disciplined armies, but that he possessed all those rarer qualities which alone could enable a man to mold half-brutalized hordes of slaves into a great nation. Calmness, disinterestedness, patience, perseverance, meekness, coupled with keen energy, rapidity of action, unfailing courage—"wisdom in council and boldness in war"—constituted the immense power which he held over the hundreds of thousands who knew no law in their newly-acquired liberty, and who were apt to murmur and to rebel on any or no provocation. Nor were the hostile Bedouin tribes, whose territories the new emigrants approached, easily overcome with untrained warriors, such as formed the ranks of Moses's army. The jealousy of certain elders fostering seditions within, added to his unceasing vexations; and to fill the measure to overflowing, indeed, his own brother Aaron, whom he had made his representative during his temporary absence on the Mount of Sinai, himself assisted in the fabrication of an idol. His sacred office as legislator he in reality first assumed in the third month after the Exodus, when, after many hard and trying marches and counter-marches—from Goshen to Succoth (? Latopolis, the present old Cairo); thence, by a *detour*, to Etham (? Ramlieh), Pi-hachiroth (? Bedea), through the Red sea, to the desert of Shur (? Al-Djofar), Marah, Elim (Wadi Gharandel), desert of Sin (Wadi Mocatteb, or Wadi Al-Sheikh), Dophka, Alus, Raphidim (near the Makkad Sidna Mousa)—made more trying by want of food and of water, by encounters with Pharaoh and the Amalekites, having arrived near the Mount of Sinai, he made the people encamp all round, and ascended the summit of the mountain by himself. On the incidents connected with the "revelation" made to the whole people, we need not dwell any more than on any other part of this well-known narrative. Suffice it to point out briefly, that the tendency of the whole law was to make the Hebrews a people "consecrated to the Lord," "a holy people, and a kingdom of priests," i.e., a people of equals both before God and the law. Three distinct parts compose this Mosaic constitution. The doctrine with respect to God and his attributes; the "symbolical" law, as the outward token of his doctrine, and the moral and social law. The Decalogue forms a kind of summary of all the three: the existence of Jehovah as the Absolute Being, the liberation of the people and the prohibition of polytheism, and the representation of the divinity by visible images (i.—iii). While the institution of the Sabbath, the symbol of creation and the Creator, forms the basis of all religious observances (iv.), the remaining part of the laws relate to the intercourse among the members of the human commonwealth; the gratitude of children is inculcated; murder, adultery, theft, false witness, coveting of others' goods are prohibited. The groundwork of these regulations had, indeed, been a special inheritance in the family of the Abrahamites from the earliest times; but the vicissitudes of fortune, the various migrations, and the enormous increase of this family, and its being mixed up for long years with the surrounding idolaters, had obliterated nearly all traces of the primeval purity of creed in the populace. The wisdom displayed even in the minor regulations of the Mosaic dispensation, with respect to their adaptation to the peculiarity

of the race, the climate, the political state of the country which they were to inhabit; in the hygienic regulations, and the rules which treat of the social and domestic relations; and, above all, the constantly-reiterated caution from mixing again with other nations, such as they found them in Canaan—and the neglect of which subsequently proved their ruin—is traced to a direct influence of Jehovah, generally indicated by the words, "And God spake to Moses, speak unto the children of Israel." An ample ritual, in connection with the tabernacle, or constantly-visible symbol of a divine dwelling; the allegory of an ever-new covenant represented by sacrifices, prayers, purifications, kept the supreme task of being priests and a holy people unceasingly before the eyes of the nation. The tribe of Levi (q.v.) to a certain degree acted in this respect as permanent representatives; and not to Moses's sons, but to his brother Aaron and his descendants, was intrusted the office of high-priest.

When on the eve of entering into the promised land, the people broke out in open rebellion, and threatened, by a spontaneous return to the land of slavery, to undo the entire work of Moses's life. Convinced that they were not as yet fit to form a commonwealth of their own, the liberator and lawgiver had to postpone, for the long space of 40 years, the crowning act of his work; and, in fact, did not himself live to see them taking possession of the hallowed territory. How these years of nomadic journeying through the desert (El-Tyh or Al-Tyh Beni-Israel) were spent, save in rearing up a new generation of a more manly and brave, as well as more "civilized" stamp, we can only conjecture. All those who had left Egypt as men were doomed to die in the desert, either by a natural death, or by being suddenly "cut off," in consequence of their openly defying Moses, and through Moses Jehovah. The apparent lack of incidents during this period has indeed furnished grounds for various speculations on this subject, and critics have tried to reduce it to a much shorter space, without, however, being able to prove their point. Even Goethe, with more ingenuity than knowledge of the subject, has endeavored to prove the "forty" to be a mythical round number, the real time being two years. The testimonies of the Hebrew prophets and historians, however, are perfectly unanimous on the subject (cf. Jos. v. 6; xiv. 10; Amos, ii. 10; v. 26; Ps. xcv. 10, etc.) and modern criticism has mostly endorsed the number as in keeping with the circumstances. On the first month of the fortieth year after the exodus, we find Moses at the head of an entirely new generation of Hebrews at Kadesh, in the desert of Phoran or Zin. Here his sister Miriam died. Here also, for the first time, Moses seeing the new generation as stubborn and "hard-necked" as their fathers, is recorded to have despaired of the Divine Providence; and his disobedience to the letter of the command given to him, "to speak to the rock," is alleged as the reason "that his bones too had to fall in the desert." His brother Aaron died at Hor (near Petra, according to Josephus and St. Jerome), whither the Israelites had gone next. Not long afterwards, Moses once more had occasion to punish with relentless severity the idolatrous tendencies of the people (Baal Peor), thus showing that age had had no power of making him relax his strong rule over the still half-savage and sensuous multitude. Having finally fixed the limits of the land to be conquered, and given the most explicit orders to Joshua, to Eliezer, and the chiefs of the ten tribes, respecting its division, he prepared the people for his own impending death. He recalled to their minds in the most impressive language, their miraculous liberation, and no less miraculous preservation in the desert. Their happiness—their life—was bound up, he told them, in the divine law, communicated through him by Jehovah. A recapitulation of its principal ordinances, with their several modifications and additions, and reiterated exhortations to piety and virtue, form the contents of his last speeches, which close with one of the grandest poetical hymns. The law was then handed over to the priests that they might instruct the people in it henceforth; Joshua was installed as successor (while his own sons sunk into the obscurity of ordinary Levites), and he blessed the whole people. He then ascended the mount of Nebo, from whence he cast a first and last look upon the land for which he had pined all his life, and on which his feet were never to tread. He died upon this mountain, 120 years old, in the full vigor of manhood, according to the Scriptures, "and no man knew his burial-place up to this day"—so that neither his remains nor his tomb were desecrated by "Divine honors" being superstitiously paid to them.

This is a summary of Moses's life as derived from biblical as well as non-biblical sources. The latter—except, perhaps the very doubtful traditions of Manetho—belong, whatever may be the date of the respective documents of the Pentateuch, to a much later age, and bear the air of tradition and legend, grown out of those very documents, so plainly on their face, that they are of about the same importance for historical purposes as the cycle of Midrash-sagas that have gathered around Moses, and which are reproduced variously in Moslem legendaries. On his office as a "prophet:"—what was the special nature of his revelations, how far the doctrines promulgated by him were traditional among the Abrahamites, and how much of his laws is due to Egyptian influences; whether part of them was first inaugurated by later generations and ascribed to him, or whether others were never carried out at all: on these and similar questions which have been abundantly raised, more especially in recent times, we must refer for fuller information to the special works on the subject. Some notices of the more important points will be found under Genesis, Jews, Pentateuch, Decalogue, etc. There seems, however, but one conclusion. The brief span of human history of which we

have any knowledge, shows few, if any, men of Moses's towering grandeur—even with all the deductions that the most daring criticism has yet proposed.

MOSHEIM, Johann Lorenz von, a distinguished church historian of Germany, was b. at Lübeck on Oct. 9, 1694, and studied at Kiel. In 1723, he became ordinary professor of theology at Helmstedt, from which he was removed in 1747 to a similar office in Göttingen. He died chancellor of the university of Göttingen, Sept. 9, 1755. His theological works are numerous, amongst which are a work on Bible morality, *Sittenlehre der Heiligen Schrift* (new ed. continued by J. P. Miller, 9 vols. Helmst. 1770–78); and discourses, *Heiligen Reden* (3 vols. Hamb. 1732, et seq.). But his most important contributions to theological literature are in the department of ecclesiastical history, in which his *Institutiones Historiæ Eccleiasticæ* (Helmst. 1755) is familiar to every student as a work of great learning, fullness, and accuracy. It has been translated from the original very elegant Latin into English and other languages. The best English translation is that by Dr. James Murdock (3 vols. New York, 1832), of which there are many reprints. Besides this, Mosheim is the author of *Institutiones Historiæ Christianæ Majores* (Helmst. 1763); *De Rebus Christianorum ante Constantinum Commentarii* (Helmst. 1753): *Dissertationes ad Hist. Ecclesiasticam pertinentes* (2 vols. new ed. Altona, 1767); and *Versuch einer unparteiischen Ketzergeschichte* (2 vols. Helmst. 1746–48). His stand-point is that of liberal orthodoxy: yet he is essentially *dogmatic*, and pays more regard to the mere "opinions" of men than to the character and genius shining through them; hence, his *Church History* is far inferior in point of richness, depth, and suggestiveness to that of Neander.

MOSKWA, a river of European Russia, a branch of the Oka, which is itself a branch of the Volga. It is celebrated in history for the great battle, called the battle of Borodino (q.v.), fought on its banks, Sept. 7, 1812, from which Ney (q.v.) obtained his title Prince of Moskwa. The Moskwa rises in a marsh in the government of Smolensk, passes close by the towns of Moshaisk and Svenigrod, passes through the city of Moscow, and joins the Oka near Kolomna, in the government of Moscow. The whole length of its course is about 290 miles. A considerable commerce is carried on by boats on the Moskwa, and it is directly connected with the Volga by the *Moskwa Canal.*

MOSLEM. See Mussulman; Mohammedanism; *ante.*

MOSOSAU'RUS, Meuse Lizard, a genus of huge marine lizards, whose remains occur in rocks of cretaceous age. Three species are known, one from the upper chalk of Sussex, a second from the cretaceous beds of North America, and the third from the Maestricht beds. This last (*M. Hofmanii*) was first known from a nearly perfect head dug out of St. Peter's Mount in 1780, and popularly called the great animal of Maestricht. Originally the property of Hofman, it was taken from him, in virtue of some clause in their charter, by the ecclesiastical authorities of Maestricht. who, in their turn, were compelled to give it up to the victorious French army, and by them it was removed to Paris. It is said that the French cannoniers, when preparing for the siege, had instructions not to point the artillery toward that part of the town in which the precious specimen was deposited. This head is 4 ft. in length, and the animal to which it belonged is estimated to have been 25 ft. long. The total number of the vertebræ was 133: they were concave in front and convex behind, and were fitted to each other by a ball-and-socket joint, admitting of easy and universal flexion; the sacrum seems to have been wanting. The limbs were developed into four large paddles, and these with the comparatively short and strong tail, the bones of which were constructed to give great muscular power, enabled the animal to move quickly through the water in pursuit of its prey. The jaws were furnished with a single row of strong conical teeth. Cuvier first showed the affinities of the animal. It is most nearly related to the modern monitor, but differs from all modern lizards in its peculiar adaptations for an ocean life, and in its great size. The largest living lacertian is only 5 ft. in length, and of this a large proportion is made up by the tail; the Mososaurus, with its short tail, is estimated to have been at least 25 ft. long.

MOSQUE, a Mohammedan house of prayer. The word is derived, through the Italian *moschea*, from the Arabic *mesjid*, a place of prayer. The form of the oldest mosques (at Jerusalem and Cairo) is evidently derived from that of the Christian basilica, the narthex being the origin of the court, with its arcade, and the eastern apses representing the principal buildings of the mosque facing Mecca. The original forms became, however, entirely obliterated in the progress of Mohammedan architecture, and the mosques, with their arcaded courts, gateways, domes, and minarets, became the most characteristic edifices of Saracenic art. Wherever the Mohammedan faith prevailed, from Spain to India, beautiful examples of these buildings exist. They vary considerably in style in different countries, the Saracens generally borrowing much from the architecture of the various nations who adopted their faith. In India, the mosques have many features in common with the temples of the Jains, while in Turkey they resemble the Byzantine architecture of Constantinople. Everywhere the dome is one of the leading and most beautiful features of the mosques, which commonly consist of porticoes surrounding an open square, in the center of which is a tank or fountain for ablution. Arabesques and sentences of the Koran inscribed upon the walls, which are

generally white-washed, and never bear any device representing a living thing, are the only ornaments of the interior. The floor is generally covered with mats or carpets; there are no seats. In the s.e is a kind of pulpit (Mimbar) for the imám; and in the direction in which Mecca lies (the Kibleh), there is a niche (Mehrab) toward which the faithful are required to look when they pray. Opposite the pulpit, there is generally a platform (Dikkeh), surrounded by a parapet, with a desk bearing the Koran, from which portions are read to the congregation. The five daily prayers (see MOHAMMEDANDISM), which are generally said at home—especially by the better classes—on week-days, are said in the mosque by the whole congregation on Fridays, the days of Al-Gumah, or the assembly, the Moslem Sundays, together with some additional prayers, and at times a sermon is superadded to the service. It is not customary for women to visit the mosques, and if they do, they are separated from the male worshipers. The utmost solemnity and decorum are preserved during the service, although in the hours of the afternoon (when there is no worship) people are seen lounging, chatting, even engaged in their trade, in the interior of the sacred building. On entering the mosque, the Moslem takes off his shoes, carries them in his left hand, sole to sole, and putting his right foot first over the threshold, he then performs the necessary ablutions, and finishes by putting his shoes and any arms he may have with him upon the matting before him. The congregation generally arrange themselves in rows parallel to that side of the mosque in which is the niche, and facing that side. The chief officer of a mosque is the nazir, under whom are two imáms, a kind of religious official, in no way to be compared with what we understand by a clergymen of a creed, but who performs a certain number of religious rites, as long as the nazir allows him to do so, and who, being very badly remunerated, generally has to find some other occupation besides. There are further many persons attached to a mosque in a lower capacity, as mueddins (q.v.), bowwabs (door-keepers), etc., all of whom are paid, not by the contributions levied upon the people, but from the funds of the mosque itself. The revenues of mosques are derived from lands. With many of the larger mosques, there are schools, academies (medressehs), and hospitals connected, and public kitchens, in which food is prepared for the poor.

MOSQUÉRA, RUY GARCIA, 1501–55, b. Spain, a navigator who accompanied Sebastian Cabot to South America in 1526, where nine years later he joined Pedro de Mendoza in founding Buenos Ayres. His descendants for three hundred years have been prominent and influential in Colombia.

MOSQUI'TO (Span. *gnat*), a name very generally given to the most troublesome species of *culex*, and allied genera. See GNAT. The name mosquito is given, according to Humboldt, in some parts of tropical South America to species of *simulia*, which are active during the day, whilst species of *culex*, active chiefly during the night, are called *zancudoes;* but these latter are the mosquitoes of other countries generally. The name was probably first used in the West Indies, where it particularly designates a species (*C. mosquito*) very similar to the common gnat, but not quite so large, with black proboscis, and marked with silvery white on the head, thorax, and abdomen. It abounds in the warm parts of America, especially in marshy districts and in the vicinity of stagnant waters. It and similar species extend even to very northern regions, appearing during the heat of summer in prodigious swarms. Similar species are found also in similar situations in almost all parts of the world, and are almost as great a pest in Lapland as within the tropics. The bite which they inflict is painful, and their incessant sharp buzzing prevents sleep. In India and other countries, beds are provided with *mosquito curtains* of gauze, which are closely drawn, to protect the occupant, while the natives who cannot avail themselves of such protection, smear their bodies with oil. So numerous are mosquitoes in some localties in South America, that the wretched inhabitants sleep with their bodies covered over with sand three and four inches deep, the head only being left out, which they cover with a handkerchief; and travelers have been obliged to have recourse to the same expedient. Even thick clothes afford at best a very partial protection from mosquitoes, being readily penetrated by the proboscis. Mosquitoes are readily attracted to a lamp, and perish in its flame; but where they are numerous, a lamp only causes additional swarms to congregate to its neighborhood until it is extinguished, as is often very soon the case, by their dead bodies.

MOSQUITO COAST, MOSQUITO TERRITORY, or MOSQUITIA, formerly a native kingdom, under the protectorate of Britain, lies on the e. coast of Central America, having Honduras on the n., Nicaragua on the w., and Costa Rica on the south. The area is estimated at 15,000 English sq.m., but as 20,000 m. of contested territory lie between it, and Honduras and Nicaragua, its extent would be more correctly given at 25,000 sq. miles. The coast is low, with many bays and lagunes, and possesses a number of good harbors. The two principal rivers are the Rio de Segovia (which rises within 35 m. of the Pacific ocean), and the Rio Escondido, both of which flow into the Caribbean sea. The climate is rainy, and the temperature, considering the latitude, is cool and equal, the thermometer seldom rising above 82° or falling below 71°. On the whole, this territory is one of the most healthy parts of Central America. Ague is not unusually common, epidemics are exceedingly rare, and white people who do not recklessly expose themselves enjoy the best health. The swampy grounds are generally covered with

Mosses, Lichens, Fungi, etc.—1. Polytrichum juniperifolium. 2. Hypnum splendens. 3. Andreæa alpina. 4. Sphagnum subsecundum. 5. Cup-moss. 6. Cladonia (Reindeer moss). 7. Parmelia tiliacea. 8. Usnea barbata florida. 9. Gyrophora (Tripe de Roche). *Liverworts:* 10, 11. Marchantia polymorpha. 12. Jungersmannia platyphylla. 13. Marchantia. *Fungi:* 14. Cyathus olla. 15. Cross-section of mushroom-cap. 16. Organs of fructification. 17. Agaricus fascicularis. 18. Polyporus fomentarius. 19. Polyporus umbellatus. 20. Truffle (Tuber cibarium). 21. Agaricus campestris. 22. Hydnum suaveoleus. 23. Clavaria flora. 24. Helvella esculenta. 25. Agaricus deliciosus. 26. Hypoxylon polymorphum. 27. Morel (Morchella esculenta). 28. Hysterium Fraxinii. 29. Sphæria fusca.

dense forests, in which dye-woods and timber-trees of great value abound. Rice, maize, manioc, and other tropical plants, are cultivated. The country abounds in deer of various kinds, half-wild horses and oxen roam in the savannas, which are covered with tall grass, and alligators and serpents are common. The chief exports are mahogany, cocoa, ginger, sarsaparilla, and tortoise-shell, but the whole trade is inconsiderable. The inhabitants are of various races, the greater portion being aboriginal, but many are a cross between the native Indians and runaway negroes; they do not number more than from 10,000 to 15,000 in all. Their chief occupations are hunting and fishing, but a little agriculture and cattle breeding are also practiced.

The Mosquito Coast was discovered in 1502 by Columbus, and though never conquered, was claimed by Spain till about 1660, when the king, with consent of his people, placed himself under the protection of Britain. British colonists at different times attempted to found settlements in various parts of the country, but from various causes were soon after compelled to withdraw. Of late years they have met with more success. The foothold Britain thus obtained in Central America was viewed with great jealousy by the United States, who left no means untried to effect her expulsion. During the British protectorate a sort of constitutional government was established, consisting of a legislative body, and regular jury courts. In July, 1850, the United States and Great Britain bound themselves by the Clayton-Bulwer treaty "not to occupy, fortify, colonize, or exercise dominion over the Mosquito Coast, or any part of Central America;" and in November, 1859, Britain ceded the protectorate of Mosquito Coast along with the Bay islands to Honduras, a proceeding which gave rise to much discontent among the natives of the coast, and a complete rebellion of the islanders. However, by a subsequent treaty, concluded Jan. 26, 1860, the whole territory was finally handed over to Nicaragua.

MOSS-AGATE. See MOCHA STONE, *ante*.

MOSS-BUNKER, or BONY FISH. See MENHADEN, *ante*.

MOSSES, *Musci*, an order of acotyledonous plants, consisting of mere cellular tissue without vessels, and distinguished from *Hepaticæ* (q.v.), the order with which they are most nearly allied, by having always a leafy stem, and an operculated capsule or urn (*sporangium* or *theca*), which opens at the top, and is filled with spores arranged around a central column (*columella*). The capsule is covered by a hood (*calyptra*); and when it is ripe, and has thrown off the calyptra and operculum, exhibits around its mouth a single or double row of rigid processes, few or numerous, but always either four or a multiple of four, collectively called the *peristome*. These reproductive organs are viewed by many botanists as female flowers or *pistillidia*; whilst reproductive organs of another kind, sometimes found on the same plant, but more generally on distinct plants, are regarded as male flowers or *antheridia*. These are minute cylindrical sacs, occurring in the axils of the leaves, or collected into a head inclosed by variously modified leaves at the summit of the stem, and finally bursting and discharging a great number of spherical or oval vesicles, through the transparent walls of which, when moistened with water, filaments (*spermatozoïds*) coiled up within them may be seen wheeling rapidly round and round. As the sacs merely discharge these vesicles and perish, it is supposed that the spermatozoids contained in them may effect the fertilization of the spore-producing capsules; but this wants confirmation, and their particular office as reproductive organs is not yet fully ascertained.—None of the mosses are large plants, many are very small. Many have elongated stems, often branching; others have the stem scarcely developed, so that they seem to consist of a mere tuft of leaves. They are generally social in their manner of growth. They are among the first plants which begin to clothe the surface of rocks, sands, trunks of trees, etc., adapting inorganic matter for the support of higher kinds of vegetation. They love moisture, and are generally more abundant in cold and temperate than in hot climates. They struggle for existence on the utmost limits of vegetation in the polar regions and on mountain-tops. They dry up and appear as dead in a very dry state of the atmosphere, but revive when moisture returns. Some of them grow in bogs, which they gradually fill up and consolidate. They are of great use in protecting the roots of many plants from cold and from drought, and afford harbor to multitudes of insects. Some of them supply food for cattle, particularly for the reindeer, when nothing better is to be obtained, and a wretched kind of bread is even made by some of the dwellers in the Arctic regions, of species of *Sphagnum*. Some are astringent and diuretic, but their medicinal virtues are unimportant. Among the other principal uses to which they are applied by man are the packing of things liable to be broken, the littering of cattle, the covering of garden plants in winter, and the stuffing of the open space in roofs to moderate the heat of attic rooms in summer and their cold in winter—perhaps the most important use to which they are ever put, at least in Britain, and to which, as the benefit is great and easily attained, it is wonderful that they are not much more frequently applied. The abundance of mosses in meadows and pastures is disagreeable to farmers. The best remedies are proper drainage, the application of lime, and the liberal use of other manures, by which the soil may be enriched, so that better plants may grow with sufficient luxuriance, upon which the mosses are choked and disappear.

Several thousand species of mosses are known. Many of the mosses are very beauti-

ful, and their capsules and other organs are interesting objects of study, even with an ordinary magnifying-glass.

MOSS-TROOPERS, marauding bands that inhabited the borders between Scotland and England during the last half of the 17 c., compelling the vicinage to purchase security by paying a constant rent to them. They were called moss-troopers because they dwelt in the mosses and always rode in troops. In Fuller's *Worthies of England* it is stated that, at one time, they numbered several thousands, and that their great enemies were "the laws of the land and the lord William Naworth," who finally reduced them to legal obedience. Scott mentions them in *The Lay of the Last Minstrel.*

MOST, JOHN. See page 885.

MOSTAR', a t. of European Turkey, capital of Herzegovina (q.v.), on the Narenta, forty-five miles s.w. of Bosna-Seraï. It is surrounded by embattled walls, contains ten mosques, a Greek church, and a famous Roman bridge of one arch, ninety-five ft. in span. Silk, grapes, and wine are produced, and knife-blades and weapons are manufactured. Mostar is also a place of considerable trade. Pop. 18,000.

MO'SUL, a t. of Asiatic Turkey, in the province of Al-Jezireh (ancient Mesopotamia), is situated on the right bank of the Tigris, opposite the ruins of ancient Nineveh (q. v.), and 180 m. up the river from Bagdad. It is surrounded by walls, and is still in a more flourishing condition than most Turkish towns, on account of its caravan trade with Diarbekir, Bagdad, and Aleppo, though its prosperity is nothing to what it formerly was. During the middle ages it supplied all Europe with its rich manufactures—*muslins*, according to Marco Polo, got their name from this town, now, on the contrary, the bazaars of Mosul, are filled with the manufactures of the west. The principal causes of its diminished importance are the rise of Abushehr (q. v.) as an emporium of trade, and the opening up of the new sea-route to India by the isthmus of Suez. Mosul is the seat of a Jacobite patriarch, and was formerly the great metropolis of all the Mesopotamian Christians (the Nestorians, the United Chaldæans, the Jacobites, etc.), but war, pestilence, famine, Mohammedan proselytism, oppression, and incessant anarchy have greatly reduced their numbers. Pop. estimated at from 18,000 to 40,000, of whom about a fourth are Christians; 1500 Jews; the rest Mohammedans (Arabs, Kurds, and Turks).

MOTACIL'LIDÆ. See WAGTAIL.

MOTAZ'ILITES, or MUTAZALITES, a "heretical" Mohammedan sect, dating a few generations after Mohammed, of which brief mention has been made under the heading MOHAMMEDAN SECTS. Their name is derived from an Arabic word, denoting to "separate one's self," and originally applied to any special sect or union of men, but the Motazilites becoming the most important and dangerous in Islam, they received this denomination by way of eminence. They were also called Moattalites—i. e., those who divest God of his attributes—and Kadarija, i. e., "those who hold that man has a free will, and deny the strict doctrine of predestination." The first beginnings of this sect are traced to Mabad, who, in the time of Mohammed himself, already began to question predestination, by pointing out how kings carry on unjust wars, kill men, and steal their goods, and all the while pretend to be merely executing God's decrees. The real founder of the sect, as such, however, is Wasil, b. Ata. He denied God's "qualities," such as knowledge, power, will, life, as leading to, if not directly implying, polytheism. As to predestination itself, this he only allowed to exist with regard to the outward good or evil that befalls man, such as illness or recovery, death or life, but man's actions he held to be entirely in his own hands. God, he said, had given commandments to mankind, and it was not to be supposed that he had, at the same time, preordained that some should disobey these commandments, and that, further, they should be punished for it. Man alone was the agent in his good or evil actions, in his belief or unbelief, obedience or disobedience, and he is rewarded according to his deeds. These doctrines were further developed by his disciple, Abu-l-Hudail, who did not deny so absolutely God's "qualities," but modified their meaning in the manner of the Greek philosophers, viz., that every quality was also God's essence. The attributes are thus not without but within him, and so far from being a multiplicity, they merely designate the various ways of the manifestations of the Godhead. God's will he declared to be a peculiar kind of knowledge, through which God did what he foresaw to be salutary in the end. Man's freedom of action is only possibly in this world. In the next, all will be according to necessary laws immutably preordained. The righteous will enjoy everlasting bliss; and for the wicked, everlasting punishment will be decreed. Another very dangerous doctrine of his system was the assumption that, before the Koran had been revealed, man had already come to the conclusion of right and wrong. By his inner intellect, he held, everybody must and does know—even without the aid of the divinely given commandments—whether the thing he is doing be right or wrong, just or unjust, true or false. He is further supposed to have held, that unless a man be killed by violent means, his life would neither be prolonged nor shortened by "supernatural" agencies. His belief in the traditions was also by no means an absolute one. There was no special security, he said, in a long, unbroken chain of witnesses, considering that one fallible man among them could corrupt the whole truth.

Many were the branches of these Motazilites. There were, apart from the disciples of Abu-l-Hudail, of whom we have just spoken, the Jobbaians, who adopted Abu Ali

Al-Wahhab's (Al-Jobbâi's) opinion, to the effect, that the knowledge ascribed to God was not an "attribute;" nor was his knowledge "necessary;" nor did sin prove anything as to the belief or unbelief of him who committed it, who would anyhow be subjected to eternal punishment if he died in it, etc.—Besides these, there were the disciples of Abu Hashem—the Hashemites, who held that an infidel was not the creation of God, who could not produce evil. Another branch of the Motazilites were the disciples of Ahmed Ibn Hayet, who held that Christ was the eternal word *incarnate,* and assumed a real body; that there were two gods, or creators, one eternal, viz., the Most High God, and the other not eternal, viz., Christ—not unlike the Socinian and Arian theories on this subject; that there is a successive transmigration of the soul from one body into another, and that the last body will enjoy the reward or suffer the punishments due to each soul: and that God will be seen at the resurrection with the eyes of understanding, not of the body.

Four more divisions of this sect are mentioned, viz., the Jâhedhians, whose master's notion about the Koran was, that it was "a body that might grow into a man, and sometimes into a beast, or to have, as others put it, two faces—one human, the other that of an animal, according to the different interpretations." He further taught them, that the damned would become fire, and thus be attracted by hell; also, that the mere belief in God and the Prophet constituted a "faithful." Of rather different tendencies was Al-Mozdar, the founder of the branch of the Mozdarians. He not only held the Koran to be uncreated and eternal, but so far from denying God the power of doing evil, he declared it to be possible for God to be a liar and unjust.—Another branch was formed by the Pasharians, who, while they carried man's free agency rather to excess, yet held that God might doom even an infant to eternal punishment—all the while granting that he would be unjust in so doing.—The last of these Motazilite sectarians we shall mention are the Thamamians, who held, after their master, Thamâma, that sinners would undergo eternal damnation and punishment; that free actions have no producing author; and that, at the resurrection, all infidels, atheists, Jews, Christians, Magians, and heretics should be returned to dust. We cannot, in this place, enlarge upon the different schools founded by the Motazilites, nor upon the subsequent fate. The vast scientific development, however, which their doctrines begot, and which resulted in the encyclopædic labors called "The Treatises of the Sincere Brethren and True Friends," are touched upon under SINCERE BRETHREN (q. v.). See Weil, *Geschichte der Khalifen;* Sale's *Koran;* Steiner, *Mutaziliten;* Dieterici, *Transactions of the German Oriental Society,* etc.

MOTETT', a name applied to two different forms of musical composition—1. A sacred cantata, consisting of several unconnected movements, as a solo, trio, chorus, fugue, etc.; 2. A choral composition, generally also of a sacred character, beginning with an introduction in the form of a song, perhaps with figurative accompaniment; after which follow several fugue subjects, with their expositions, the whole ending either with the exposition of the last subject, a repetition of the introduction, or a special final subject. A motett differs in this respect from a double or triple fugue, that the subjects never appear simultaneously, but are introduced one after the other. In one form of the motett, the successive phrases of an entire chorale are treated as so many fugal subjects.

MOTH, the popular name of all the insects included in the section *Nocturna* of the order *Lepidoptera* (q.v.). They formed the genus *Phalæna* of Linnæus, but are now distributed into many genera and families, the species being extremely numerous. Among them are the very largest *Lepidoptera,* and also the smallest. They are distinguished from hawk-moths, and from most of the butterflies, by their bristle-shaped antennæ, tapering from base to apex. The antennæ are frequently feathered or pectinated, especially in the males. The proboscis is generally similar to that of butterflies; but there are some groups of moths in which it is merely rudimentary, and these are supposed to take no food after they pass from the larva state. The thorax is generally shorter and more robust than in butterflies; the tibiæ of the legs often bear a kind of spur; the wings are held either in a horizontal or in an inclined position when at rest; or, as in many of the smaller moths, are wrapped around the body. The two wings of the same side are generally hooked together in repose by means of bristles on the margin. The females of a few species are wingless.—Moths are generally nocturnal, although to this rule there are a few exceptions. They often exhibit great richness in beauty of colors, although in brightness of color they are not generally equal to butterflies. Their food is similar to that of butterflies.—They lay great numbers of eggs, which exhibit varieties of form and color as great as those of the insects themselves. Their caterpillars are more widely various in form and characters than those of the butterflies; differing from each other in the number of their legs, and in horns, protuberances, caudal appendages, hairy covering, etc. Some are social both in the larva and chrysalis state, forming, on their entering the latter state, very curious nests. The chrysalis of a moth is never angular nor furnished with protuberances, and is generally enveloped in a silken cocoon, pretty close and compact: although some moth chrysalids are found in a mere space filled with threads which cross each other in various directions. Silk-worm (q.v) moths are among the insects most useful to man; but moths in general are regarded by him as injurious, the larvæ of many feeding on leaves of various kinds, and often destroying valuable

crops; and the larvæ of some small species proving very destructive to clothes, books, etc. The largest and most splendid moths inhabit tropical countries. Some of the most interesting and important kinds of moth are noticed in separate articles. Notwithstanding a popular dislike of moths, observation of their habits and of the richness of color of many of them, is a favorite pursuit of naturalists.

MOTHER CAREY'S CHICKEN, a name familiarly given by sailors to the storm petrel and other small oceanic species of Petrel (q.v.).—The name MOTHER CAREY'S GOOSE, is in like manner, given to the great black petrel or gigantic fulmar (*Procellaria gigantea*) of the Pacific ocean; a bird of about three feet in entire length, with very long wings, and blackish gray plumage, a ravenous feeder on dead whales and all other animal garbage, and which also kills and preys upon other sea-birds.

MOTHER OF PEARL, the shells of the large bivalve mollusk *Meleagrina margaritifera*, which also produces the precious pearls. See PEARL. These shells are collected in vast numbers in the tropical seas, chiefly on the coast of Ceylon, Manilla, Cuba, Panama, and the South Sea islands. Those from Panama are small and thick, and are known in commerce as "bullock" shells; those from Manilla are finest in quality, often as much as a foot in diameter, round and flat. There are two varieties—the white or silver-lipped, and the black-lipped. So enormous is the trade in these shells, that the imports of this country alone amount to 3,000 tons per annum, the value of which is nearly £100,000. Although large quantities of these shells are consumed in inlaying fancy wood work, papier-mâché, and in making knife-handles and other small ornamental objects, by far the greater portion is required for making buttons, chiefly in Birmingham.

MOTHER WATER, MOTHER LYE. See LYE.

MOTHERWELL, a town of Scotland, in Lanarkshire, eleven m. from Glasgow. Its progress, which of late years has been very rapid, is chiefly due to the coal mines in its neighborhood. Pop. (1861) 2,925; (1881) 12,904.

MOTHERWELL, WILLIAM, a Scottish poet and antiquary, was b. in Glasgow, Oct. 13, 1797, and educated chiefly at the grammar-school of Paisley, where, in his fifteenth year, he entered the office of the sheriff-clerk. At the age of twenty-one, he was appointed sheriff-clerk depute of the county of Renfrew. In the following year he published his first work, the *Harp of Reugrewshire*, containing biographical notices of the poets of that district, from the 16th to the 19th century. This work was but the prelude to one of far greater importance—his *Ministrelsy, Ancient and Modern*, which appeared at Glasgow in 1827. In 1828 he commenced the *Paisley Magazine*, in which some of his finest original pieces first saw the light, and in the same year accepted the editorship of the *Paisley Advertiser*, a conservative journal. In 1830 he became editor of the *Glasgow Courier*. He died in that city, Nov. 1, 1835, at the early age of 38. Motherwell displays in his best moods (but *only* then) a rich, beautiful, and strong imagination, great warmth and tenderness of feeling, and a thorough knowledge of the language of a poet. His *Jeanie Morison* is unsurpassed for the mingled pathos and picturesque beauty of its reminiscences of boyish love; *The Sword-Chant of Thorstein Raudi* is perhaps the most heroic rune in the English tongue; and the little piece beginning, "My heid is like to rend, Willie," has seldom been read without tears. An enlarged edition of his poetical remains, with a memoir, was published in London in 1849.

MOTHERWORT, *Leonurus Cardiaca*, a plant of the natural order *Labiatæ*, found about hedges and in waste places in Europe, and now abundantly naturalized in some parts of North America. It is not very common in Britain, and probably has been introduced. It is perennial, has a branched stem about three feet high, stalked leaves, the lower ones three-lobed, and crowded whorls of reddish-white flowers. The calyx has five pungent spreading teeth. The upper lip of the corolla is shaggy on the upper side, the lower lip trifid. The anthers are sprinkled with shining dots. The plant was formerly in much use as a domestic pectoral medicine, but is now comparatively little employed. It has a strong, but not agreeable smell.—Other species of the same genus are found in Europe and the n. of Asia.

MOTION, LAWS OF, are the fundamental principles connecting force and motion in the physical universe; and are obviously to be derived from *experiment* alone, since intuitive reasoning cannot possibly give us any information as to what may or may not be a law of nature. Though these laws are derived from experiment, it cannot be said that we have any very *direct* experimental proofs of their truth—our most satisfactory verifications of them are derived from the exact accordance of the results of calculation with those of observation in the case of such gigantic combinations of mutually influencing bodies as that of the solar system; and it is by such proofs that they must be considered to have been finally established.

They seem first to have been given systematically and completely by Newton, at the opening of the *Principia;* but the first two were known to Galileo, and some of the many forms of a *part* of the third were known to Hooke, Huyghens, Wren, and others. We shall give them here in order, with a few brief comments, showing their *necessity* and their *use.*

First, then, we naturally inquire, what matter would do if left to itself; and, by con-

sidering cases in which less and less external force is applied to a body, we are led to the statement called the *first law of motion:*

1. *Every body continues in its state of rest or of uniform motion in a straight line, except in so far as it may be compelled by impressed forces to change that state.*

This expresses simply the *inertia* of matter—i.e., a body cannot alter its *state* of rest or motion; for any such alteration external *force* is required. Hence the definition of force (q.v.), as that which changes or tends to change a body's state of rest or motion.

Now, how does the change of state depend on the force which produces it? This is obviously a new question, to be resolved by experiment; and the answer is the *second law of motion:*

2. *Change of motion is proportional to the impressed force, and takes place in the direction of the straight line in which the force acts.*

Newton's silence is as expressive as his speech. Nothing is here said about the previous motion of the body, or about the number of forces which may be at work simultaneously. Hence, a force produces its full effect in the form of change of motion, whether it act singularly, or be associated with others; and whatever, moreover, be the original motion of the body to which it is applied. Hence, there is no such thing as equilibrium of *forces*; every force produces motion—and what we call equilibrium is *not* the balancing of forces, but the balancing of their *effects.* Hence, the absurdity of attempting to found the science of statics on any other basis than is to be derived from the second law of motion; which, in fact, leads us at once (by the *parallelogram of velocities*, which is a purely geometrical conception) to the *parallelogram of forces*, and thence, with the help of the third law, to the whole subject of statics. The second law also supplies the means of measuring *force* and *mass;* and of solving any problem whatever concerning the motion of *one* particle.

But more is required before we can study the motion of a *system* of particles—as a rigid body, or a liquid, for instance; or a system of connected bodies. Here there are mutual actions and reactions of the nature of pressure or of transference of *energy* (see FORCE) between the parts—and these are regulated by the *third law of motion:*

3. *To every motion there is always an equal and contrary reaction: or, the mutual actions of any two bodies are always equal and oppositely directed in the same straight line.*

Thus, the mutual pressure between two bodies has equal, but *opposite*, values for the two. The tension of a rope is the same throughout, and tends as much to pull *back* the horse at one end as to pull *forward* the canal-boat at the other. The earth exerts as much attractive force on the sun as the sun exerts on the earth—and the same law applies to the other attractive and repulsive forces, as those of electricity and magnetism.

But Newton goes much further than this; he shows, in fact, that action and reaction (subject to the third law) may consist in *work done by a force*, instead of the mere force or pressure itself. From this form of the third law we derive at once the principle of virtual velocities (q.v.), which in its application to machines is familiar as "*What is gained in power is lost in speed.*" But we also derive the grand principle of the indestructibility of work or energy; at all events in the case of the ordinary mechanical forces—and this must be regarded as one of the grandest discoveries which science owes to Newton. It is true that he merely *mentions* it, and then abruptly passes to another subject; yet we can hardly exaggerate the value of this single remark. Experimenters, mainly Davy and Joule, have since shown that all the physical energies, as heat, light, electricity, etc., are subject in their transformations to the third law of motion, and thus the system constructed by Newton for ordinary dynamical purposes, is now found to rule the most mysterious of the affections of matter. For a development of this, see our article on FORCE.

MOTION, ANIMAL. Motion or progression is that function by which an animal is able to transport itself from place to place. It is enjoyed exclusively by animals, there being nothing strictly analogous to it in the vegetable kingdom. The organs employed in locomotion are of two kinds, the *passive* and the *active;* the former including all those textures which form the skeleton, and by which its segments are united, as fibrous and areolar tissue, synovial membrane, cartilage, fibro-cartilage, and bone, while the latter includes the muscles with the nerves, which convey to them the mandates of the will.

Before proceeding to notice the different modes of progression of men and animals, it may be expedient to say a few words on *standing*, or the natural attitude of an animal. This attitude depends upon the form and functions of the limbs. Most of the terrestrial mammals and the reptiles (excepting the serpents), both of which use four feet in walking, have the backbone (the vertebral column) nearly horizontal (being only slightly concave downwards), and resting, at the same time, both on the fore and hind legs. Birds, whose anterior extremities are intended for flight, stand upon the posterior limbs only, although in their case, too, the backbone is generally nearly horizontal when the animal is at rest. Man alone stands erect with his head supported on the summit of the nearly vertical vertebral column. Some other animals (monkeys, hares, kangaroos, etc.) can rise more or less erect, but in their case the attitude is obviously not the natural one.

In standing it is requisite that the limbs should be so arranged that the center of gravity may fall within the space included by the feet. If the center of gravity does

not fall within this space the animal cannot stand, but must fall to that side to which the center of gravity inclines. On this account certain aquatic birds (the albatross, for example), which have their feet placed very far back, cannot use them for walking. If an animal has four legs, it is not necessary that they should have the broad base, which is essential in bipeds. We see that most quadrupeds have comparatively small feet, while birds are furnished with long toes, which, when spread out, form large bases of support. Moreover, the flexor muscles of the toes are so arranged that the weight of the body causes them to contract firmly, and hence birds are enabled to sleep standing without any effort.

Walking is the most common form of progression. When it is accomplished by two legs only, as in man, the body is inclined forward, carrying the center of gravity in that direction; and while one leg supports the body the other is thrown forward to prevent it from falling, and to sustain it in turn. Hence, walking has been defined to be a continual falling forward, interrupted by the projection of the leg. Those writers who have especially studied the theory of walking (Borelli, the brothers Weber, and Bishop) have divided the time of a step into two portions—i.e., that in which one leg only rests on the ground, and that in which both legs rest on the ground. The period in which both feet are on the ground is shorter than that in which the body is supported by one leg only. During the time the body is supported by one leg, the other leg swings from behind forward, without the active intervention of its muscles, but by the mere force of gravity—in short, like the pendulum of a clock. When this leg is again placed on the ground the first interval ends, and the other—i.e., that in which the body is supported by both legs—begins, and, of couse, terminates with the raising of the other leg. The time that the body is supported by both legs diminishes as the velocity increases, and vanishes as the walk merges into a run; while, on the other hand, it attains its maximum in extremely slow walking, when it is found by experiment to amount to half the time in which only one leg supports the body. The greatest velocity of walking is attained when the time of a step is equal to half the duration of the motion of the swinging leg, and the velocity in walking of any given person depends on the time taken in making each step, and on the length of the steps; and both of these are, again, dependent on the height at which the center of gravity of the body or the heads of the thigh-bones are carried above the ground; for as the height of the latter diminishes, the length of the step is increased, while its time is diminished, and *vice versa*. The best walkers are incapable of acquiring a speed of more than 7 m. an hour; and even this speed cannot be kept up for any length of time. The walking of quadrupeds is a similar process to that of bipeds, except that the body always rests on at least two legs. The limbs are raised in a determinate order, and usually in such a manner that the hind-leg of one side succeeds the fore-leg of the opposite side.

Running consists of the same succession of motions as walking; but these motions are so accelerated that there is a period between two steps when the body is not supported on either leg; and this constitutes the essential difference between the two paces. It requires a far greater expenditure of muscular force than walking, and cannot be long maintained without considerable exhaustion. First-rate runners can accomplish a mile in a few seconds under four minutes and a half, and 10 m. in an hour. (Levett in a match with Frost, which came off on Mar. 22, 1852, at Copenhagen Fields, ran 10 m. 250 yds. in 52′ 53″, and Deerfoot ran 11 m. 740 yds. at Brompton in an hour). In quadrupeds there are various paces besides walking, which are known as trotting, cantering, and galloping; and as every one is familiar with the ordinary paces of the horse, we shall take that animal as our illustration. In *trotting*, the horse moves its legs in pairs diagonally. Thus, if the left fore and right hind-leg be raised, and advanced first, the right fore and left hind-leg will be raised the instant the others reach the ground. In fact, in trotting, the first pair are actually raised before the other legs reach the ground, so that there is a minute interval when all four legs are raised above the ground at the same time. The velocity acquired by moving the legs in pairs (as in running), instead of consecutively (as in walking), depends upon the circumstance that in trotting each leg rests on the ground during a short time and swings during a long time, while in walking the swing occupies a short period, and the rest a comparatively long one. In *cantering*, the animal, after advancing the two fore-legs one after the other, brings forward the two hind-legs simultaneously; and when this movement is greatly urged, the fore-legs are raised together, as well as the hind-legs, and the pace then becomes the *gallop*.

In *leaping*, the horse raises the fore-legs from the ground, and propels the body upward and forward by the hind legs alone. This act in the horse is, however, mainly the result of education, and those animals that leap or spring upon their prey (as the members of the cat tribe) crouch before leaping, in order to throw the body forward with the greatest possible force, by first bending all the limbs, and then suddenly extending them. As the hind legs are, however, the essential agents in leaping, we observe that in those animals whose natural mode of progression is leaping—as frogs, hares, kangaroos, etc.—the hind legs are much longer, and more muscular than the fore-legs. Leaping is a common mode of progression in many short-legged birds (blackbirds, thrushes, finches, sparrows, etc.), in which the step would be extremely short if performed by moving the legs alternately. There is also a large number of insects, such as grasshoppers, fleas, etc., whose ordinary mode of progression is by leaps; and it is in this class of animals that

the leaping power is developed to its greatest extent. The common flea, for example, can leap 200 times its own length. While fleas, locusts, and grasshoppers leap by means of their long and strong hind legs, other insects, as the *poduridæ*, or spring-tails, possess a forked tail, which they bend beneath the body, and which, when suddenly extended, propels them to a considerable distance.

Climbing, is merely walking on an inclined or vertical surface. It is usually accomplished by means of sharp nails or claws, as in the cat-tribe, the lizards, etc. In many birds, as the woodpeckers, parrots, etc., the toes are arranged in two divisions, so as to grasp branches in the manner of a hand. Bears and sloths use their arms for climbing, while monkeys use their hands, and in some cases their tails. It is only in a very few cases, as in the sloth, that this is the ordinary method of progression.

The act of *flying* in the bird is accomplished by the simultaneous action of the two anterior limbs, the wings, much as leaping is by that of the two posterior limbs. See Flying: Birds. Many attempts have been made to estimate the velocity at which different birds can fly. Whether, as has been stated, the eider-duck can fly 90, and the hawk 150 m. in an hour, is very questionable; but it has been ascertained that carrier-pigeons can accomplish from 38 to 42 m. in that time.

The bats are the only mammals which possess a true power of flight. For a description of their organs and mode of flight, we must refer to the article Bat, where will also be found a notice of the false claims of some other mammals, as the so-called flying-squirrel, to the possession of true flight. Similarly, the actions of the flying lizard and of the flying-fish are not true flight. In no class of animals is the mechanism of flight so perfect as in insects. The dragon-fly, for example, can outstrip the swallow; and can do more in the air than any bird, as it can fly backwards and sidelong, to right or left, as well as forward without turning. The wings of insects, of which there may be either one or two pair, are analagous (as instruments of motion) to the feathered wings of birds, but are regarded as homologous to (or in their essential nature) branchiæ or respiratory organs. For details regarding the mechanism employed in their aërial progression by insects, see Insects.

Swimming is the mode of progression employed by most aquatic animals. It mainly differs from flying in this respect, that water being much more dense than air, and the body of the animal being nearly of the same weight as the water it displaces, very little effort is required to keep the animal from sinking, and hence almost the whole of the muscular force can be employed in progression. In fishes, the locomotive organs consist of the fins and tail, the latter being the great propelling organ. The swimming of a fish has been correctly compared to the motion of a boat propelled by a single oar or scull at the stern. In the same manner as a succession of strokes alternately right and left propels the boat straight forward, so the fish advances by striking alternately right and left with its tail, The caudal fin, in which the tail ends, is vertical in fishes, and is usually considerably forked, when there is great speed. The ventral fins are for the purpose of keeping the fish in its proper position, with the back upwards, as is shown by a well-known experiment of Borelli, who, after cutting off these fins, restored the living fish to the water, when it rolled from side to side like a drunken man. The air-bladder with which many fishes are provided, and which they can distend and contract at pleasure, facilitates their swimming by enabling them to modify their specific gravity. Most terrestial mammals, excepting man, swim at once the first time they find themselves in deep water. The reason of this is, that their limbs move in water precisely as they do on land, and no new action either as regards direction or order is required, as is the case with man, to enable them to swim. Those which frequent the water, as seals, otters, and beavers, have webbed feet like ducks and other palmiped birds, the toes being united by membranes, which, when expanded, act as paddles. A large number of invertebrate animals move chiefly by swimming. Thus lobsters move by means of a vertical motion of the tail, and many of the crabs by means of their posterior legs, which are fashioned like oars. Many insects swim with their legs, which are fringed with hairs to give additional surface. The cuttle-fish uses its long arms as oars, and darts through the water with extreme rapidity; while other mollusks erect sail-like organs, by which they are propelled along the surface of the water. Swimming, as a gymnastic exercise, is described in a separate article.

Notices of the more special modes of progression will be found under a variety of heads. See Crustacea, Serpents, Worms.

MOTION, in Plants. See Irritability and Spore.

MOTIONS, a name given to certain dramatic exhibitions, illustrating scriptural narrative, which prevailed in England in the 15th c. and later. The characters were represented by wooden puppets, while the dialogue was spoken behind the scenes.

MOTIVE, or Motivo, in a musical composition, means the principal subject on which the movement is constructed, and which, during the movement, is constantly appearing in one or other of the parts, either complete or modified. In elaborate and long compositions there are also secondary motives.

MOTLEY : co., Tex. See page 885.

MOTLEY, John Lothrop, ll.d., d.c.l., etc., American historian, was b. at Dorchester, Mass., April 15, 1814. After graduating at Harvard university, he spent a year at Göttingen, another at Berlin, and traveled in Italy and other parts of southern

Europe. Returning to America, he studied law, and was admitted to the bar in 1837; but preferring literature; he wrote a historical romance, entitled *Morton's Hope* (1839), which had little success. In 1840 he received the appointment of secretary of legation to the American embassy to Russia, but soon resigned, and in 1849 published another unsuccessful novel, entitled *Merry Mount, a Romance of the Massachusetts Colony.* He attracted attention, however, by some valuable historical essays for American reviews, among which may be mentioned one on De Tocqueville's *Democracy in America*, and another on "Peter the Great;" and having planned a history of Holland, he proceeded to Europe for materials, and after five years' labor, published in 1856 *The Rise of the Dutch Republic.* In 1860 appeared a continuation of it: *The History of the United Netherlands from the Death of William the Silent to the Synod of Dort.* Motley was appointed in 1861 U. S. minister at the court of Vienna, a post from which he was recalled in 1867. In 1869 he was sent as minister to the court of St. James, but was recalled the following year. In 1874 he published *The Life and Death of John of Barneveldt, Advocate of Holland; with a View of the Primary Causes and Movements of the Thirty Years War* (2 vols.). He died May 29, 1877.

MOTMOT. See Momotidæ.

MOTOGRAPH. See page 885.

MOTRIL', a town of Spain, in the province of Granada, and 35 m. s. of the city of that name, in a productive district 3 m. from the sea. Agriculture and fishing are the principal employments of the inhabitants. Pop. 14,000.

MOTT, Gershom: 1822–84; b. N. J.; served in the Mexican war, and in 1861 raised a regiment of volunteers from his native state. He took part in McClellan's peninsula campaign, was wounded at the second battle of Bull Run, and again at Chancellorsville, where he commanded the 2nd N. J. brigade. He was at Gettysburg, and the next year was brevetted maj.gen. In the last campaign against Richmond, he was in command of the 2nd division of the 4th corps. He was made full maj.gen. in 1865.

MOTT, Lucretia, 1793–1880; b. Mass.; married James Mott in 1811. She taught school in Philadelphia in 1817, and the next year became a preacher in the society of Friends. She made a tour through New England and the middle states, preaching, and denouncing slavery and intemperance. She helped organize the American anti-slavery society in 1833, was a delegate to the "world's anti-slavery convention" at London in 1840, and participated in the first women's rights convention in 1848. For the rest of her life she continued her advocacy of woman-suffrage and her opposition to slavery. After the division in the society of Friends in 1827, she sided with the Hicksites.

MOTT, Valentine, ll.d., 1785–1865; b. N. Y.; graduated in medicine at Columbia college in 1806, and afterwards studied in London and Edinburgh. He was appointed professor of surgery in Columbia college in 1809, which place he filled till the medical department of that institution was united with the college of physicians and surgeons in 1813, and for 13 years afterwards. He then, in 1826, with Drs. Hosack, Francis, Mitchill, and others, founded the Rutgers medical college, which, owing to difficulties in regard to its charter was disorganized four years afterwards. He was for several years professor of surgery in the medical department of the university of New York. Dr. Mott was celebrated as a skillful operator in all branches of operative surgery, but more particularly for the ligature of arteries, in which his experience and success was greater than that of any other (see Ligature). He introduced an operation for immobility of the lower jaw, and in 1821 performed the first operation for osteo-sarcoma of that member. He performed the operation of lithotomy 165 times, and amputated more than 1000 limbs. Sir Astley Cooper said of him that he had performed more of the *great* operations than any man, living or dead. He visited Europe in 1835, and traveled in England, on the continent and in the east, publishing an account of his travels in 1842. He was not a voluminous writer, the scalpel being more congenial to his hand than the pen. He, however, found time to translate Velpeau's *Operative Surgery* (4 vols. 8 vo.) and to furnish several papers or the notes of them for the transactions of the New York academy of medicine. His cliniques were reported by Samuel W. Francis in 1860.

MOTTE, Rebecca (Brewton,) 1740–1815; b. South Carolina; married Jacob Motte, a planter. At the time of the revolution she was a widow, and resided in a house on the Congaree river, which was taken as a garrison by British soldiers. Through her aid the house was set on fire, and all the garrison captured by Marion and Lee. Her biography may be found in Mrs. Ellet's *Women of the Revolution.*

MOTTE (or MOTHE) CADILLAC, Sieur Antoine de la. See Cadillac.

MOTTEVILLE, Françoise Bertaut de, Dame Langlois de, 1621–89; b. France; daughter of a gentleman of the court and the lady's maid of Anne of Austria, whom she succeeded. At the age of 18 she was made to marry de Motteville, who was 80. and died at 82. After his death she seemed never to have a desire for marriage. Brought up at court when Richelieu was its central figure, forced to leave it with Anne of Austria, when the latter was banished from it by that minister, returning at his death; during all the years of her life devoted to her patroness, and to her memory after death she seems in the midst of a court where passions and intrigues were nearly universal, to have kept herself free from all. For this reason the journal of daily events which she kept during much of her life, written with the straightforward simplicity of

a meditative character which made those quiet observations her pastime, has become one of the most valuable sources of information concerning the characteristics of the court people of her time. It was published in 1723 under the title of *Mémoires pour servàir a l'histoire d'Anne d'Autriche.*

MOTTO, in heraldry, a word or short sentence which forms an accompaniment to a coat-of-arms, crest, or household badge. Mottoes were originally attached to the badge when the family had one, or to the crest where there was no badge. In later heraldry, the practice is to place the motto in an escrol either over the crest or below the shield. A motto is sometimes a religious or moral sentiment, as "Gardez la foi," "Humanitate;" it is not unfrequently a heroic exclamation or war-cry, "Courage sans peur," "Forward." In a great many cases it bears reference to the crest, badge, or some bearing of the escutcheon; thus, Stuart, earl of Moray, has for crest a pelican wounding herself, and for motto, "Salus per Christum Redemptorem;" and not a few mottoes are punning allusions to the family name—as Scudamore, "Scuto amoris Divini;" Vernon, "Ver non semper viret;" "Fare, fac," for Fairfax; and "Time Deum, cole regem," for Coleridge. Two mottoes are sometimes used by the same family—one above the crest, the other below the shield. The motto, "Dieu et mon Droit," which accompanies the royal arms of Great Britain, is supposed to have been a war-cry, and was used in England at least as early as the time of Henry VI. Its origin has been assigned to a saying of Richard I., "Not we, but God and our right have vanquished France."

MOUFFLON, or MUSMON, *Ovis* or *caprovis musimon*, the wild-sheep of Corsica, Sardinia, Cyprus, Greece, etc. It is about the size of a small fallow-deer, covered with hair and not with wool, except that hair of a somewhat woolly character appears in winter. The upper parts are brownish, the under parts whitish; the hair of the neck is long; the tail is very short. The horns of the male are very large, approaching to those of the argali. The moufflon lives chiefly in the higher parts of mountainous regions, and is not easily approached by the hunter.

MOULD, or MOULDINESS, the common name of many minute fungi which make their appearance, often in crowded multitudes, on animal and vegetable substances, either in a decaying or in a living but morbid state, To the naked eye they often seem like patches or masses of fine cobweb, and are discovered by the microscope to consist of threads more or less distinctly jointed, sometimes branched. Some species of mold occur on many different substances; other seem to be peculiar to substances of particular kinds, as decaying pears, decaying gourds, etc. Some of the moulds belong to the suborder of fungi called *physomycetes.* See FUNGI. One of these is the COMMON MOULD (*mucor mucedo*), so plentifully found on fruit, paste, preserves, etc., in a state of incipient decay, the progress of which it hastens. It consists of cobweb-like masses of threads, from which rise many short stems, each bearing at the top a roundish membranous blackish spore-case.—A nearly allied, and also very common species, is *ascophora mucedo*, which forms a bluish mould on bread. From a spreading cobweb-like bed rise long slender branches, terminated by spore-cases, of which the vesicle collapses into the form of a little *pileus.*—An interesting species of mould, remarkable for its luxuriance and beauty of colors—at first white, then yellow, with orange spore-cases, then shining green or olive, and with threads often several inches long—grows on fatty substances.—Other species of mould are ranked among *hyphomycetes*, a suborder of fungi, having a floccose thallus and naked spores. One of these is the BLUE MOUD (*aspergillus glaucus*), which imparts to cheese a flavor so agreeable to epicures, and perhaps marks it as in a condition most suitable for promoting the digestion of other aliments, of which epicures eat too much. Advantage is often taken of the fact that a small portion of cheese affected with mould will speedily infect sound cheese into which it may be introduced. It is one of the few cases in which the propagation of these fungi is ever desired and sought after by man.—SNOW MOULD (*lanosa nivalis*) is found on grasses, and especially on barley and rye beneath snow, often destroying whole crops. It appears in white patches of a foot or more in diameter, which finally become red as if dusted with red powder.

Even living animals are liable to be injured by fungi of this kind. Silk-worms are killed in great numbers by one called MUSCARDINE (q.v.), or SILK-WORM ROT. Such fungi are sometimes developed on the mucous membrane and in internal cavities of vertebrated animals; and on the bodies of invertebrate animals, as the common house-fly, which, in the end of autumn, when it becomes languid, often dies from this cause. Even strongly-scented substances, if moist, are liable to be attacked by mould of one kind or other; nor are strong poisons, either animal or vegetable, a sufficient safeguard. *Ascophora mucedo*, springs up readily in paste full of corrosive sublimate; and the mycelium of moulds is found in strong arsenical solutions. The only sure preventive of mould is dryness. Many of the moulds vegetate is liquids, but do not attain their perfect development, only appearing as filamentous and flocculent mycelia. The *vinegar plant* (q.v.) is an instance of this kind.

Mildews and moulds are very nearly allied.

The rapidity with which these fungi are produced is marvelous. "In favorable circumstances, a plant will pass through every stage of growth to perfect maturation of its

seeds in less than two days, the threads which sustain the ripe sporangia being so long, and yet so delicate, as to make it a marvel that they can remain erect."—(*Berkeley.*)

MOULD, the model or pattern from which workmen execute mouldings, ornaments, etc. Also, the shape or bed in which metal and other castings are made.

MOULD, Jacob Wrey, b. England, 1825; educated in Cork, Ireland, for matriculation at King's college, London, which he entered in 1839, graduating with honors in 1842. He was then articled to the celebrated architect, Owen Jones, and executed with his own hands, from casts or from Mr. Jones's sketches, illustrations of the second volume of *The Alhambra*. Soon after he produced illuminated illustrations for *Gray's Elegy*, the *Book of Common Prayer*, and a considerable part of Owen Jones's *Grammar of Ornament*. In 1849 he became associated with Lewis Vuliamy a London architect, and during the illness of his patron designed and erected the beautiful mansion at Stanhope Gate, Hyde Park, London, on the site of the marquis of Hereford's *Gaunt House*. After its completion, he was again associated with Owen Jones in the construction and decoration of the Moresque-Turkish divan at Buckingham palace, and in the decoration of the exhibition building of 1851. A few years later he came to the United States and was engaged by Moses H. Grinnell to design and superintend the erection of All Souls (Unitarian) church, on 4th avenue, New York city; a building which, by its departure from previous models in that city, excited lively attention and criticism. In 1857 he was appointed assistant on the architectural staff of the Central Park commissioners, associated with Calvert Vaux, the chief architect. From that time until 1874, Mould, as assistant architect, designed many details of the bridges, terraces and architectural structures in the Central park. In 1870 Mould was made architect-in-chief of the department of public parks, and retained that place until 1874, when he was removed by a change of commissioners. The same year he was invited to Lima, Peru, to execute architectural work for Henry Meiggs, and was there working out his designs when the death of Meiggs, in 1877, and the war with Chili soon after, necessitated his return to New York in 1879. In the year 1880, Mould was appointed by the park commissioners of New York city, to design the architectural features of the new Morningside park.

MOULDING. See Founding, *ante*.

MOULDINGS, the curved and plane surfaces used as ornaments in cornices, panels, arches, etc., and in all enriched apertures in buildings. In classic architecture the mouldings are few in number, and definitely fixed in their forms. There are eight kinds of these regular mouldings, viz, the Cyma, the Ovolo (or Echinus), the Talon, the Cavetto, the Torus, the Astragal, the Scotia, and the Fillet (q.v.); and each of these mouldings has its proper place assigned to it in each order. See Column. In Gothic architecture, and all other styles, the mouldings are not reduced to a system as in the Greek and Roman styles, but may be used in every variety of form at the pleasure of the artist. Certain forms generally prevail at one period in any style. Thus, in Gothic architecture, the date of a building may in many instances be determined by the form of the mouldings. The Norman mouldings were very simple in outline, and very frequently enriched with the zigzag and billet ornaments.

In the early English style, the mouldings are also simple in outline, and are usually arranged in rectangular divisions, and consist of alternate rounds and hollows. In late examples of this style, the fillet was introduced and led to the more elaborate form of mouldings during the decorated period.

The mouldings of the perpendicular style are generally flatter and thinner than the preceding, and have large hollows separated by narrow fillets, which produce a meager effect.

Each of these styles has its peculiar ornaments and style of foliage; and when these are used along with the mouldings, there is no difficulty in determining the approximate date of a building.

MOULINS, a t. of France, capital of the department of Allier, on the right bank of the river Allier, here crossed by a handsome stone bridge of 13 arches, lies 213 m. by railway, s.e. of Paris, and 95 m. n.w. of Lyons. Moulins was formerly the capital of Bourbonnais. It is a clean, well-built town, with pretty promenades. The principal buildings are the cathedral of Notre Dame (for the enlargement of which the sum of one and a half million francs was granted in 1852), the museum, the theater, the public library containing 20,000 vols., the new town-house, the palace of Justice, and the college. Of the old castle, built by the duc de Bourbon in 1530, only a square tower remains, which is used as a prison. Moulins carries on trade in coal, wood, iron, grain, wine, oil, and cattle. Pop. '81, 20,446.

MOULMEIN', a t. in the province of Tenasserim, British Burmah, situated on the gulf of Martaban, in the e. of the bay of Bengal, at the junction of the rivers Salween, Gyne, and Attaran, in 16° 29′ n. lat., and 97° 38′ e. long. Moulmein, one of the healthiest stations in India, is a pretty specimen of an eastern town. It is divided into five districts, each of which is under a goung or native head of police. The streets are, for the most part, shaded with trees, principally of the acacia tribe, and the glossy jack is often seen half covering a native house, its great fruit, as large as a child's head, ripening in

the sun. The principal street, about 3 m. in length, runs due n. and s., and parallel with the river Salween. The native houses are constructed in the usual Burman style of bamboo, and a thatch made of the leaf of the water-palm. All are raised on piles, according to the universal custom of the country. Men walk about with the green paper chattah, or Chinese umbrella, used throughout the provinces; the *gharei*, or India cab, dashes along, the attendant imp reveling in heat and dust.

Moulmein is backed by a fine range of hills, on whose heights flash the gilded spires of innumerable pagodas; and here, too, are built many pretty residences, commanding a fine view of the town, river, and adjacent country, which for picturesque beauty and varied scenery has few equals. Moulmein boasts various churches, chapels, and missionary establishments, several charitable and educational institutions, substantial barracks, a general hospital, public library, etc. Vessels drawing 10 ft. of water can come up to Moulmein under charge of pilots from Amherst, and at spring-tide ships of any tonnage may reach the town. The rise and fall of the water is at that time from 20 to 23 feet. The population of Moulmein is steadily, if slowly, on the increase. In 1856 it was 43,683; in 1880, it had reached 53,080. Of these, divided according to their religion, about 27,000 were Buddhists, 11,000 Hindus, 6,000 Mussulmans, and 2,000 Christians. The mean temperature of Moulmein for the year 1872 was 78°—the highest being 96° in April, and the lowest 61° in Jan. As to nationality, besides the Burmans proper, the inhabitants of Moulmein include Eurasians or half-castes, Taliens, Chinese, Shans, Karens, Armenians, Jews, Malays, and natives of Hindustan.

Moulmein possesses great facilites for ship-building, and many fine vessels have lately been constructed in the building-yards of Tavoyzoo and Mopoon. The principal exports from Moulmein are teak-timber and rice; the imports consist of general merchandise, chiefly piece-goods, hardware, provisions, and sundries.

See *The Tenasserim and Martaban Directory*; Winter's *Six Months in British Burmah* (London, 1858); Marshall's *Four Years in Burmah* (London, 1860); *Blue-Books.*

MOULTING is the term applied by naturalists to the periodical exuviation, or throwing off of certain structures, which are for the most part of an epithelial or epidermic character. Thus, in a considerable number of the *articulata* the external covering is thrown off and replaced many times during life. In some of the minute entomostracous crustacea of our pools, a process of moulting, similar to that which occurs in crabs and lobsters, occurs every two or three days, even when the animals seem to have attained their full growth. In the crabs, in which the process has been carefully observed, the *exuvium*, or cast-off shell, consists not only of the entire external covering, including even the faceted membrane which forms the anterior coat of the compound eyes, but also carries with it the lining membrane of the stomach, and the plates to which the muscles are attached. During growth this moulting takes place as often as the body becomes too large for the shell; and after the animal has attained its full size it is found to occur at least once a year, at the reproductive season. During the early growth of insects, spiders, centipedes, etc., a similar moult is frequently repeated at short intervals, but after they have attained their full size no further moulting takes place. In the *vertebrata* we have examples of as complete a moulting, and replacement of new skin, among frogs and serpents as occurs in the articulata, the whole epidermis being thrown off at least once, and, in some instances, several times yearly. In birds the feathers are periodically cast off and renewed; in mammals generally the hair is regularly shed at certain periods of the year; and in the deer tribe the casting off and renewal of the antlers must be regarded as a special example of moulting. In man the continual exuviation of the outer layers of the epidermis is a process analogous to that which takes place on a more general scale in the lower animals.

MOULTON, Ellen Louise Chandler, b. Conn., 1835; married William V. Moulton, a Boston journalist, in 1855. Besides many contributions to periodicals, chiefly of fiction and poetry, she has published *This, That, and the Other*, 1854; *Juno Clifford*, 1855; *My Third Book*, 1859; *Bedtime Stories*, 1873; *Some Womens' Hearts*, 1874; *More Bedtime Stories*, 1874; *Poems*, 1877; *New Bedtime Stories*, 1880; *Random Rambles*, 1881.

MOULTON, Jeremiah, 1688–1765; b. Me.; stolen by the Indians while a child, but eventually returned on the release of some Indian prisoners. In 1724 he commanded the forces that captured the town of Norridgewock from the Indians. He was afterwards prominent in Maine as a judge of the court of common pleas.

MOULTRIE, a co. in e. Illinois, intersected by the Chicago and Paducah railroad, and the Illinois Midland, with a junction at Lovington, and the Decatur, Mattoon and Southern railroad, connecting with the Chicago and Paducah at Sullivan; 350 sq.m.; pop. '80, 13,705—13,269 of American birth, 16 colored. Its surface is generally level and well timbered, and its fertile prairies are drained by the head waters of the Kaskaskia river. Grain and live stock are the chief products, and it is a good grazing country. Co. seat, Sullivan

MOUL'TRIE, Fort, a fortress on Sullivan's island, at the mouth of Charleston harbor, S. C., celebrated for the repulse of a British squadron commanded by sir Peter Parker, Jan. 28, 1776. The fort, at that time, was hastily built of palmetto logs and sand, with 31 guns and 435 men. The spongy wood of the palmetto was found to resist the cannon

balls perfectly. The fort was afterwards rebuilt, and in April, 1861, took part in the reduction of fort Sumter, and the commencement of active hostilities in the civil war of secession.

MOULTRIE, John, d. 1773; b. Scotland; a physician who emigrated to this country about 1730, and, settling in Charleston, secured a large practice.

MOULTRIE, John, 1799–1874; b. London; educated at Eton—where he was associate editor, with Hartley Coleridge and W. M. Praed, of the *Etonian*—and at Cambridge. He took orders in the English church, and was made rector of Rugby church, where he remained for the rest of his life, He published a volume of *Sermons* in 1852, and the same year edited the *Poetical Remains* of his fellow-Etonian, W. Sidney Walker. In 1845 he edited the works of Gray, and in 1854 his own complete *Poems* were published.

MOULTRIE, William, 1731–1805; b. S. C.; son of Dr. John, a Scotch physician who settled in Charleston early in the century. He received an ordinary education, and in the Cherokee troubles of 1761 was a capt. in the militia. Though of British descent and closely connected with many tories, Moultrie was prominent in the popular movements which preceded the revolution; in 1775 was a delegate to the colonial congress, and in the same year was chosen col. of a S. C. regiment. He assisted in the seizure of the arsenals and forts, placed a battery at Haddrill's Point, which drove off two blockading vessels, and when the siege of Charleston by the fleet of sir Peter Parker and sir Henry Clinton's land forces was threatened, obtained permission to construct a fort of palmetto logs on Sullivan's island, which he began in March, 1776. (See Moultrie, Fort.) Gen. Lee, the commander-in-chief, thought the position poor and the construction faulty, but when on June 28 the fleet appeared, the terrific cannonade of the ships produced little effect on the soft palmetto wood, while Moultrie, though poorly supplied with ammunition, made every shot tell, and at night the fleet retired with a loss of 225 killed and wounded, the colonial forces having but 36 men disabled. This remarkable and gallant defense resulted in the ultimate withdrawal of the British forces from the coast of South Carolina. Moultrie received the thanks of congress, and in his honor the fort was named fort Moultrie. In September of the same year Moultrie was made a brig.gen. and put in command of the department of Georgia and South Carolina. In 1779 the British forces again appeared, and under col. Gardner were defeated by gen. Moultrie near Beaufort. When gen. Prevost was advancing upon Charleston, Moultrie obstructed him in every possible way, and thus gave the city time to prepare for its defense. In the defense of the city he again displayed military ability, was held a prisoner for two years after the surrender, and at last exchanged for gen. Burgoyne. In 1782 he was made a maj.gen.; in the years 1785 and 1794 was elected governor of his state, and then retired to private life. His *Memoirs of the Revolution* (1802) was written in part while he was a prisoner, and finished in later years.

MOUND (Lat. *mundus*), in heraldry, a representation of a globe, surmounted with a cross (generally) pattée. As a device, it is said to have been used by the emperor Justinian, and to have been intended to represent the ascendency of Christianity over the world. The royal crown of England is surmounted by a mound, which first appears on the seal of William the conqueror, though the globe without the cross was used earlier.

MOUND BIRD. See Brush Turkey.

MOUNDS, and Mound Builders. See America (American Antiquities), *ante*.

MOUNDSVILLE, county town of Marshall co., W. Va., pop. 2,000. Near it is a large mound 75 ft. high, sometimes called the largest in the country, and from which it takes its present name, having been once called Grave Creek.

MOUNT, in heraldry. When the lower part of the shield is occupied with a representation of ground slightly raised, and covered with grass, this is called a mount in base; e.g., argent, on a mount in base, a grove of trees ppr.—Walkinshaw, of that ilk, Scotland.

MOUNT, William Sidney, 1807–68; b. on Long Island; until about 17 years old worked on his father's farm. He was made apprentice to his brother, a sign painter in New York city; displayed a taste for art; entered the school of the academy of design in 1826, and in 1829 began the work of portrait painting in New York. Among his best portraits were those of gen. Jeremiah Johnson and bishop Onderdonk. His greatest success, however, was in depicting humorous scenes and especially those of negro life. His "Rustic Dance," 1830, was very popular, and in 1832 he was made a member of the national academy of design. Among his pictures are "Walking the Crack," "Husking Corn," "Nooning," "Banjo Player," etc.

MOUNTAIN, The. The popular name given by the French to that part of the assembly of deputies which assumes the most radical or progressive part in legislature; and of late years more generally known as "the left"—*La gauche*. See Left. The term "mountain" was first used when the national assembly of 1789–91 moved from Versailles to Paris and occupied the riding-hall of the Louvre prepared for it. The most radical revolutionists chose the highest seats on the outside of the circle and thus acquired the title. See Montagnards.

MOUNTAIN, George Jehoshaphat, d.d., d.c.l., 1789–1863; b. England; second son of Jacob Mountain, first Anglican bishop of Quebec; graduated at Trinity college, Cambridge, in 1810. Two years later he took orders and was nominated rector of Fredericton, New Brunswick. One preferment after another rapidly followed; and in 1850 he became bishop of Quebec. He spent the greater part of his means in founding Bishops' college, in Lennoxville, P. Q. Among his published works are *Journal of a Northwest American Mission,* and *Songs of the Wilderness.*

MOUNTAIN, Jacob, d.d., 1750–1825; b. in Norfolk, England, educated at Cambridge university; took orders and held in succession the livings of St. Andrews, Buckden, and Holbeach, and was made a canon in the Lincoln cathedral. In 1793 he was nominated to the bishopric of Quebec and was the first prelate sent to the Canadas by the English church. In the establishment of mission stations and churches he was most active, and took a prominent part in the political affairs of the province.

MOUNTAIN ASH. See Rowan.

MOUNTAIN CORK. See Asbestus, *ante.*

MOUNTAIN GREEN. See Chrysocolla, *ante.*

MOUNTAIN LIMESTONE, the basement rock of the carboniferous series in the s. of England and in Wales. It consists of a calcareous rock loaded with marine remains, the greater part of the rock being made up bodily of corals, crinoids, and shells. It has a variable thickness, sometimes reaching as much as 900 feet. In the n. of England and in Scotland, the marine limestones are not separated from, but alternate with the coal-bearing strata. See Carboniferous System.

MOUNTAIN MEADOWS MASSACRE, an atrocity committed by the Indians in 1857, in Mountain meadows, Santa Clara co., Utah; as is supposed, under the instigation and direction of the Mormon leaders. A party of 120 emigrant settlers, on their way through Utah to California, had in some way aroused the suspicions of the Mormons, and at the place named were surrounded by Indians under Mormon control, and brutally massacred; only a few children of the party survived. In 1874 an investigation into the affair was ordered by the U. S. government, and John D. Lee, a Mormon bishop, and others, were indicted, tried, and condemned. Lee was executed on Mar. 22, 1877, by being shot on the very spot where the massacre took place.

MOUNTAINS. The number and the altitude of the mountains of the globe are so great that they form almost everywhere prominent objects, and operate to a large extent in modifying the climatic condition of every country in the world. Yet the amount of solid material so raised above the ordinary level of the land is not so much as might be expected. Remembering that elevated plateaus of great extent occur in several regions, and that the general surface of the earth is considerably higher than the sea level, it has been estimated that were the whole dry land reduced to a uniform level, it would form a plain having an elevation of 1800 ft. above the sea. And were these solid materials scattered over the whole surface of the globe, so as to fill up the bed of the ocean, the resulting level would be considerably below the present surface of the sea, inasmuch as the mean height of the dry land most probably does not exceed $\frac{1}{15}$th of the mean depth of the bed of the ocean.

Mountains, and especially mountain-chains, subserve important uses in the economy of nature, especially in connection with the water system of the world. They are at once the great collectors and distributors of water. In the passage of moisture-charged winds across them, the moisture is precipitated as rain or snow. When mountain-ranges intersect the course of constant winds by thus abstracting the moisture, they produce a moist country on the windward side, and a comparatively dry and arid one on the leeward. This is exemplified in the Andes, the precipitous western surface of which has a different aspect from the sloping eastern plain; and so also the greater supply of moisture on the southern sides of the Himalayas brings the snow-line 5,000 feet lower than on the northern side. Above a certain height the moisture falls as snow, and a range of snow-clad summits would form a more effectual separation between the plains on either side than would the widest ocean, were it not that transverse valleys are of frequent occurrence, which open up a pass, or way of transit, at a level below the snow-line. But even these would not prevent the range being an impassable barrier, if the temperate regions contained as lofty mountains as the tropics. Mountain-ranges, however, decrease in height from the equator to the poles in relation to the snow-line.

The numerous attempts that have been made to generalize on the distribution of mountains on the globe have hitherto been almost unsuccessful. In America the mountains take a general direction more or less parallel to the meridian, and for a distance of 8,280 miles, from Patagonia to the Arctic ocean, form a vast and precipitous range of lofty mountains, which follow the coast-line in South America, and spread somewhat out in North America, presenting everywhere throughout their course a tendency to separate into two or more parallel ridges, and giving to the whole continent the character of a precipitous and lofty western border, gradually lowering into an immense expanse of eastern lowlands. In the old world, on the other hand, there is no single well-defined continuous chain connected with the coast-line. The principal ranges are grouped together in a Y-shaped form, the general direction of which is at right angles to the new

world chain. The center of the system in the Himalayas is the highest land in the hemisphere. From this, one arm radiates in a north-east direction, and terminates in the high land at Behring straits: the other two take a westerly course; the one a little to the north, through the Caucasus, Carpathians, and Alps to the Pyrenees; the other more to the south, through the immense chain of Central African mountains, and terminating at Sierra Leone. Most of the principal secondary ranges have generally a direction more or less at right angles to this great mountain tract.

The inquiry into the origin of mountains is one that has received not a little attention. Geologists have shown that the principal agents in altering the surface of the globe are denudation, which is always abrading and carrying to a lower level the exposed surfaces, and an internal force which is raising or depressing the existing strata, or bringing unstratified rocks to the surface. Whether the changes are the small and almost imperceptible alterations now taking place, or those recorded in the mighty mountains and deep valleys everywhere existing, denudation and internal force are the great producing causes. These give us two great classes of mountains.

1. *Mountains produced by denudation.*—The extent to which denudation has altered the surface of the globe can scarcely be imagined. All the stratified rocks are produced by its action; but these do not measure its full amount, for many of these beds have been deposited and denuded, not once or twice, but repeatedly before they reached their present state. Masses of rock more indurated, or better defended from the wasting currents than those around, serve as indices of the extent of denudation. The most remarkable case of this kind with which we are acquainted, is that of the three insulated mountains in Ross-shire—Suil Veinn, Coul Beg, and Coul More—which are about 3,000 ft. high. The strata of the mountains are horizontal like the courses of masonry in a pyramid, and their deep red color is in striking contrast with the cold bluish hue of the gneiss which forms the plain, and on whose upturned edges the mountain-beds rest. It seems very probable, as Hugh Miller suggests, that when the formation of which these are relics (at one time considered as old red sandstone, but now determined by sir Roderick Murchison as being older than Silurian), was first raised above the waves, it covered, with an amazing thickness, the whole surface of the highlands of Scotland, from Ben Lomond to the Maiden Paps of Caithness, but that subsequent denudation swept it all away, except in circumscribed districts and in detached localities like these pyramidal hills.

2. *Mountains produced by internal force.*—These are of several kinds. (*a.*) Mountains of ejection, in which the internal force is confined to a point, so to speak, having the means of exhausting itself through an opening in the surface. The lava, scoriæ, and stones ejected at this opening form a conical projection which, at least on the surface, is composed of strata sloping away from the crater. Volcanoes are mostly isolated conical hills, yet they chiefly occur in a somewhat tortuous linear series, on the mainland and islands which inclose the great Pacific ocean. Vesuvius and the other European volcanoes are unconnected with this immense volcanic tract. (*b.*) But the internal force may be diffused under a large tract or zone, which, if it obtain no relief from an opening, will be elevated in the mass. When the upheaval occurs to any extent, the strata are subjected to great tension. If they can bear it, a soft rounded mountain-chain is the result; but generally one or more series of cracks are formed, and into them igneous rocks are pushed, which, rising up into mountain-chains, elevate the stratified rocks on their flanks, and perhaps as parallel ridges. Thus, the Andes consist of the stratified rocks of various ages, lying in order on the granite and porphyry of which the mass of the range is composed. The position of the strata on such mountains supplies the means of determining, within definite limits, the period of upheaval. The newest strata that have been elevated on the sides of the mountain when it was formed, give a date antecedent to that at which the elevation took place, while the horizontal strata at the base of the mountain supply one subsequent to that event. Thus, the principal chain of the Alps was raised during the period between the deposition of the tertiary and that of the older recent deposits. (*c.*) But there is yet another way in which the upheaving internal force operates, viz., where it does not act at right angles to the surface, but rather obliquely, and, as it were, pushes the solid strata forwards, causing them to rise in huge folds, which, becoming permanent, form parallel ranges of mountains. The crust of the earth, in its present solid and brittle condition, is thus curved, in a greater or less degree, by the shock of every earthquake; it is well known that the trembling of the earth is produced by the progress of a wave of the solid crust; that the destruction of buildings is caused by the undulation; and that the wave has been so evident, that it has been described as producing a sickening feeling on the observer, as if the land were but thin ice heaving over water. This mode of mountain formation has been explained when treating of the Appalachians (q.v.), which were thus formed. Many other ranges have had a similar origin, as some in Belgium and in the southern Highlands of Scotland, as has been suggested by Mr. Carruthers.

It is evident that in the last two classes the parallel ridges were produced at the same time. Elie de Beaumont generalized this, maintaining that all parallel ridges or fissures are synchronous; and on this he based a system of mountain-structure, which is too universal and too geometrical to be true. The synchronism of parallel fissures had been noticed by Werner, and it is now received as a first principle in mining. The converse

is also held to be generally true, that fissures differing in direction differ also in age; yet divergence from a center, and consequent want of parallelism, as in the case of volcanoes, may be an essential characteristic of contemporaneity. Nevertheless, Elie de Beaumont classified the mountains of the world according to this parallelism, holding that the various groups are synchronous. The parallelism does not consist in having the same relations to the points of the compass—for these, as regards n. and s., would be far from parallel—but is estimated in its relation to some imaginary great circle, which being drawn round the globe would divide it into equal hemispheres. Such circles he called great circles of reference. But beyond this, he went a step further, and proposed a more refined classification, depending on a principle of geometrical symmetry, which he believed he had discovered among his great circles of reference. It is to be feared, however, that his geometrical speculations have little foundation in nature.

MOUNTAINS OF THE MOON, the name of a supposed range of mountains running across central Africa, from the Atlantic to the Indian ocean. The Nile was supposed by the ancient geographers to rise in them. Modern explorations have disproved the existence of any such range. Speke, in 1858, gave the name to the mountains n. of lake Tanganyika.

MOUNT AUBURN. See CAMBRIDGE, MASS.

MOUNT DESERT, an island in Maine, having Frenchman's bay and five rocky islands called the Porcupines on the e.; Mount Desert rock 20 m. s. in the open sea; and Soame's sound flowing up into its s. portion for about six m.; the island being 12 m. in width and 15 m. long; pop. '80, 1017. It is included in Hancock co., and comprises the towns of Eden, Mount Desert, and Tremont, with 11 post-offices; among them, Soamesville, Seal Cove, and East Eden. The Mount Desert post-office is at Soamesville. The island is one m. from the main land, and has 3 convenient harbors, Bar Harbor, North-east, and South-west. Great Head and Schooner Head are tall cliffs on the s.e. coast. It is crossed by 7 ridges of hills, the highest peak, mount Adam or mount Green, rising to an altitude of 1762 ft. above the level of the sea; and among the mountains are beautiful lakes of considerable size. It is celebrated for the grandeur and beauty of its scenery, and is much frequented as a summer resort. It is 30 m. s.e of Bangor and was first discovered by the French in 1608, who named it St. Sauveur, but the settlement was destroyed in 1613 by an expedition commanded by Samuel Argall, of Virginia, under the governorship of sir Thomas Dale. The first house of the future permanent settlement was built by Abraham Soames, in the center of the island, overlooking the head of the sound, in 1761. It has excellent public schools, 6 churches, and about 20 hotels. It has a prosperous community engaged in cod and mackerel fishing, the manufacture of lumber, and ship-building. A feature of peculiar attractiveness as compared with many sea-shore resorts is the combination of mountain and marine scenery.

MOUNTFORD, WILLIAM, b. England, 1816; educated at Manchester college, York; became a Unitarian minister, and was pastor of a church in Manchester from 1838-41. In 1846 he published a book entitled *Martyria*, and in 1850, *Euthanasia*, works which gave him some reputation. During 1850 he also visited the United States, and accepted the pastorate of a Unitarian church in Gloucester, Mass. He soon after retired, however, from the ministry, and has since resided at Cambridge, Mass.

MOUNT GILEAD, Va. See page 885.

MOUNT HOLLY, the seat of justice of Burlington co., N. J., on a branch of the Rancocas creek, which empties into the Delaware river; terminus of two branches of the Pennsylvania railroad, affording two ways of transit to New York city, and one way to Philadelphia; 18 m. s. of Trenton; pop. 5,500. The town is, by artificial means, furnished with gas and water, the latter from a hill 200 ft. high, from which the place takes its name. There are numerous machine shops, foundries, saw-mills, and factories. It has a jail, county buildings, 8 churches, fine schools, two newspapers, and a children's home.

MOUNT HOLYOKE FEMALE SEMINARY, at South Hadley, Mass., two m. e. of the Connecticut river, and 4 m. s. of the mountain from which it takes its name. Its founder was Miss Mary Lyon, a lady who combined, in an unusual degree, physical, intellectual, and moral strength. During ten years of successful teaching in a private school, her attention was awakened to the importance of establishing a permanent institution for the education of young women, where the expenses should be very moderate and the advantages very great. The problem was difficult. At that time many people thought that for the higher education of girls little more was needed than a superficial acquaintance with a few ornamental branches. There were private schools that promised this for the daughters of the rich, and district schools sufficed for the rest. Why should colleges be established with faculties, buildings, libraries, cabinets, and apparatus, merely to educate girls? For a long time the public could not be aroused to the importance of the subject. The rich were even more indifferent than the middle classes. But as Miss Lyon thought on the enterprise she became thoroughly absorbed in it, and was willing to spend her life in poverty and toil for its sake. In 1834 she devoted herself to the task. Little by little funds were collected for the first building. Its corner-stone was laid in October, 1836, and the school opened November, 1837. Its principal objects were: 1. To provide for young women with limited pecuniary resources

a thorough practical education. 2. To supply, not a preparatory school for younger pupils, but a college for those of maturer years, admitting none under 16 years of age. 3. To educate superior teachers. 4. To arrange the institution so that the pupils should do the household work themselves, partly in order to reduce expense, but chiefly to teach the dignity of such work and to promote health, cheerfulness, independence, and symmetry of character. These objects have been kept steadily in view, and with great and increasing success through more than 40 years. The prescribed course of study embraced three years, until 1862, when a fourth year was added. There are also optional courses in Greek, German, and French, extending through the four years, which may be pursued in addition to the prescribed studies, but not as substitutes for them. In planning the course the friends of the institution were aware that many pupils would be able to pursue only a part of it. Yet to spend two years, or even one year, in thorough study is a great advantage to those whose means or opportunities allow them no more. Of late years an increased proportion of those who enter complete the course. Latin is the only ancient language required for admission. At least three-fourths of the whole number of pupils have engaged in teaching, some as a profession for life, and the rest for transient periods. The terms for board, tuition and incidentals have always been as low as would suffice to cover the ordinary running expenses. At present the sum of $175 per annum includes all charges. The buildings, grounds, library, and apparatus have been furnished chiefly by private benefactions; with the addition of $40,000 granted by the legislature of Massachusetts in 1868, after a careful inquiry into the usefulness of the seminary during the 30 years of its existence. The annual income from payments for board and tuition is about $45,000, in addition to which a small amount is received from invested funds given for specific objects connected with the welfare of the institution. The grounds comprise over sixty acres of picturesque scenery, in which nature has, to some extent, anticipated the work of the landscape gardener. The buildings are: the original main edifice, (enlarged) four stories high, with wings at each end; the gymnasium, forming with the others a quadrangle: the library, a fire-proof edifice, well arranged and handsomely finished; the Lyman Williston hall, containing well appointed lecture and recitation rooms, a chemical laboratory, cabinets of mineralogy, botany, zoology and geology, and an art gallery, enriched with some superior original paintings by celebrated American artists, and some fine copies of works by old masters; and an admirably furnished observatory, with a fine telescope. The library contains 11,000 volumes of very carefully selected works, in English literature, in the French, German, Latin, and Greek languages, and in science and art. The instruction is given by the principal, an associate principal, and twenty-eight teachers (all ladies) and by seven gentlemen (distinguished professors in other institutions) who deliver annual courses of lectures in their respective departments. The total number of students, 1885, was 270.

MOUNTMEL'LICK, a market-town and seat of poor-law union, in Queen's co., province of Leinster, Ireland. It is situated on the river Owenass, a branch of the Barrow, 47 m. directly w.s.w. from Dublin. The pop. in 1881 was 3,126. The t. has long been a chief seat of the Society of Friends, who established a manufactory of coarse woolen friezes and tweeds, by which many poor children are employed. Mountmellick was also the seat of other manufactories, especially a foundry, a machine-factory, and a beet-root sugar factory, the results of which, however, were disappointing.

MOUNT PLEASANT, seat of justice of Henry co., Iowa, on a branch of the Skunk river, which flows into the Mississippi; on the Chicago, Burlington, and Quincy railroad, 28 m. w.n.w. of Burlington; pop. 4,410. The town contains the state hospital for the insane, the Iowa Wesleyan university, organized in 1855, to which both sexes are admitted, a female seminary, 14 churches, graded public schools, 2 national banks, 2 newspapers, gas-works, sash and blind and wagon factories, and a tannery.

MOUNT PLEASANT, Penn. See page 885.

MOUNTRAILLE, co. Dakota; See MONTRAILLE.

MOUNT SAINT ELIAS. See ALASKA.

MOUNT VERNON, a t. in s.w. Indiana, on the n. bank of the Ohio river, and on the St. Louis and Southeastern railroad; pop. '80, 3,730. It is the co. seat of Posey co., and a place of considerable trade and river commerce. It is 33 m. w. of Evansville, and 142 m. s.e. of St. Louis. It is delightfully located on table land, commanding an unobstructed view of the river for miles, and has 9 churches, 2 banks (one of them national), 3 weekly newspapers, a court-house, and planing, flour, and saw mills.

MOUNT VERNON, a village in s.e. New York, on the New York, New Haven and Hartford, and the New York and Harlem railroads; pop. '80, 4,586. It is in the township of East Chester in Westchester co., and is pleasantly situated on the Bronx river, 15 m. from New York, equidistant from the Hudson river on the w. and Long Island sound on the east. It contains 8 churches, excellent public schools, 2 banks, 3 weekly newspapers, a well-organized fire department, and 4 hotels. The leading industries are the manufacture of pens, horn and rubber jewelry, glue, and carriages.

MOUNT VERNON, a city in Knox co., e. Ohio, a junction of the Cleveland, Mt. Vernon, and Delaware railroad, and the Baltimore and Ohio; pop. '80, 5,249. It is 45 m. n.e. of Columbus, and 25 m. n.w. of Newark. It was set off in 1805, and is delight-

fully located on the sloping bank of the Vernon river to the n. of the stream. The river furnishes extensive water-power, utilized by flour and saw mills, the manufacture of woolen goods, flax, twine, etc. In the city are the railroad repair shops, and manufactories of machinery, steam engines and boilers, furniture, leather, linseed oil, sashes and doors. It is the center of a considerable trade from the fertile agricultural region in its vicinity. It is lighted with gas, and has 12 churches, excellent public schools, an elegant court-house, a variety of stores, 3 banks (2 of them national), 2 newspapers, and many elegant private residences.

MOUNT VER'NON, the seat and tomb of George Washington, first president of the United States of America, on the right bank of the river Potomac, in Virginia, 15 m. below Washington. The residence of Washington, finely situated on the rising bank of the river, and his tomb, with an estate of 200 acres, have been purchased by a patriotic society of ladies, to be kept as a place of public resort, and a memorial of the "Father of his country."

MOUNT VERNON (*ante*), the home of George Washington, in Fairfax co., Virginia, on the right bank of the Potomac, 17 m. s. of Washington. The Washington mansion is of wood, 2 stories high, 96 ft. long, and 30 ft. deep. It was built in 1743, by Washington's elder brother, Lawrence, who called it Mount Vernon, after admiral Vernon, under whom he had served in the British navy. It is on a wooded hill from which there is a beautiful view of the Potomac, down to which a lawn of 5 or 6 acres slopes. A high piazza runs along the front of the house, which has 6 rooms of moderate size on the ground floor. They contain many objects of historical interest. The library was designed by Washington himself, but at present contains little of the original furniture. Most of Washington's books are in the possession of the Boston Athenæum. The tomb of Washington is a few hundred yards from the house, near a wooded ravine. The body of Washington was removed thither from the old family vault in 1831. An effort was made in 1832 to secure the removal of the body to the crypt of the capitol at Washington, but the representatives of the family refused. Mount Vernon, which had been much enlarged by Washington, was by him bequeathed to Bushrod Washington, upon whose death it came into the hands of his nephew, John A. Washington, who sold it in 1858 to the Ladies' Mount Vernon association for $200,000, of which $68,494.59 was the contribution of Edward Everett. The association hold the place in trust, as a place of public interest; and upon the dissolution of the association, or its failure to perform the objects for which it was formed, Mount Vernon will revert to the state of Virginia.

MOURNE MOUNTAINS. See DOWN, COUNTY OF.

MOURNING, a particular habit worn to express grief, especially for the decease of friends. The usages regarding mourning have varied much at different times and in different countries. Among the Jews, the duration of mourning for the dead was generally 7, but sometimes protracted to 30 days; and the external indications of sorrow consisted in weeping, tearing the clothes, smiting the breast, cutting off the hair and beard, lying on the ground, walking barefoot, and abstaining from washing and anointing themselves. Among the Greeks, the period was 30 days, except in Sparta, where it was limited to 10. The relatives of the deceased secluded themselves from the public eye, wore a coarse black dress, and in ancient times cut off their hair as a sign of grief. Among the Romans, the color of mourning for both sexes was black or dark-blue under the republic. Under the empire, the women wore white, black continuing to be the color for men, who did not cut off the hair or beard as in Greece. Men wore their mourning only a few days; women a year, when for a husband or parent. The time of mourning was often shortened by a victory or other happy public event, the birth of a child, or the occurrence of a family festival. A public calamity, such as a defeat, or the death of an emperor or person of note, occasioned a public mourning, which involved a total cessation of business, called Justitium. In modern Europe, the ordinary color for mourning is black; in Turkey, violet; in China, white; in Egypt, yellow; in Ethiopia, brown. It was white in Spain until 1498. Mourning is worn of different depth, and for different periods of time, according to the nearness of relationship of the deceased. On the death of a sovereign or member of the reigning house, a court mourning is ordered; and in this country, it is usual at the same time to recommend the adoption of a general mourning.

In Scotch law, if a husband die, whether solvent or insolvent, the widow will be entitled to a preferable payment out of the assets for mournings suitable to his rank. And the same privilege applies to mournings for such of the children as are to assist at the funeral. In England, there is no such privilege or distinction.

MOU'SA, an island of Shetland, remarkable for an object of antiquity styled Burgh-*Mousa,* which consists of a round tower of the class known in the north of Scotland as Pictish towers. Burgh-Mousa occupies a knoll close upon the rocky sea-beach, from which materials for its construction had been taken. The whole fabric is composed of flat slabs of clay-slate, which have been easily piled together in a compact mass without the aid of mortar. In exterior figure, the tower is round, inclining inward about halfway up, and then bulging out near the top. Near the foundation its circumference is 158 ft., and it measures about 40 ft. in height. On the side next the sea, there is a door-

way, and that is the only exterior aperture. If there were ever any door-posts, they have disappeared; it is feasibly conjectured, however, that instead of employing a door, the inmates had, on emergencies, built up the opening, for which there is an abundance of loose materials at hand. Entering the doorway, we find the wall 16 ft. thick, and looking upward, feel as if we were at the bottom of a well, for the circular interior has no flooring, and the top is open to the sky. Opposite the doorway, there is an entrance to a passage and stair which wind upward, within the thickness of the wall, to the summit of the building. At different places there are recesses, or galleries, leading off from the stair, lighted by apertures to the interior; such dismal holes being all that we find in the way of apartments. It is customary to speak of an outer and inner wall; but the two walls, if we so distinguish them, are so firmly bound together by the stair and otherwise, as to afford a united resistance to assault. Obviously, the structure was used as a retreat in case of attack from foreign enemies, against whom missiles could be showered down from the species of battlement formed by the top of the well-knit walls. According to tradition, the tower of Mousa was occupied by Erland, a Norwegian jarl, about 1154, when it successfully endured a siege that was undertaken to recover a runaway lady; but how any lady could have found accommodation in such miserable quarters, it is difficult to conjecture. The Society of Scottish antiquaries deserves thanks for having repaired this fine memorial of a former state of society in Shetland. From its comparatively complete state, Burgh-Mousa is considered a good specimen of the Pictish towers, so called.

MOUSE, *Mus*, a genus of rodent mammalia of the family *Muridæ* (q.v.), having three simple molar teeth in each jaw, with tuberculated summits, the upper incisors wedge-shaped, the lower compressed and pointed, the forefeet with 4 toes and a rudimentary thumb, the hind feet five-toed; the tail long, nearly destitute of hair, and scaly. This genus includes rats (q.v.) and mice; the smaller species bearing the latter name.—The Common Mouse (*M. musculus*) is perhaps not originally British, although now so abundant everywhere. It accompanies man wherever he goes, and readily colonizes every region, arctic, temperate, or tropical; its great fecundity, common also to most of its congeners, causing means to be employed everywhere for the prevention of its excessive multiplication. Aristotle made the experiment of placing a pregnant female mouse in a closed vessel filled with grain, and found in a short time no fewer than 120 mice in the vessel. Of cats and mouse-traps it seems unnecessary here to speak, and equally unnecessary to give a description of the common mouse. There are several varieties of this species. That generally found in houses is smaller, and not so dark in color, as that common in barns and farm-yards. A white variety sometime occurs, and has been perpetuated in a half-domesticated state. The common brown kind is, however, at least as easily tamed, and readily becomes familiar enough. A pied variety is not uncommon in India.—Much has been written about the singing powers of the mouse; it being asserted, on the one hand, that mice not unfrequently show a strong love for music, and a power of imitating the song of birds; whilst, on the other hand, it is alleged that the singing of mice is merely the consequence of throat disease.—The mouse makes a nest like that of a bird in the wainscot of a wall, among the chaff or feathers of a bed, or in any similar situation. The litter is generally from 6 to 10 in number.—The Wood Mouse, or Long-tailed Field Mouse (*M. sylvaticus*), is a little larger than the common mouse. Its tail is longer; its ears are also longer; its muzzle rather longer; its under parts lighter in color than in the common mouse. It is abundant throughout Britain and the temperate parts of Europe, and is a grievous pest in gardens and fields. It lays up stores of grain and other food, either in thick tufts of grass, or just under the surface of the earth. The quantity of food laid up in such stores is often wonderfully large. The field mouse is timid, gentle, and easily tamed.—The smallest British mouse, and the smallest British quadruped, is the Harvest Mouse (*M. messorius*), of which the head and body are only 2½ in. in length, the tail being almost equally long, and to some degree prehensile; the general form elongated and slender, the head narrow, the ears not large. This species is not uncommon in some parts of the south of England; it is also found in the south of Scotland, although less frequently. It makes its nest among the stalks of wheat, reeds, or other grasses, weaving together the leaves and panicles of grasses, the leaves being for this purpose cut into shreds by its teeth. The nest is a very curious structure formed by mere intertwining, without cement of any kind. It is generally suspended among the stalks. It is globular, or nearly so, and entrance to it is through an opening, which almost completely closes up again.—A still smaller species of mouse (*M. pumilus*) is found in the south of Europe.—An American species, the White-footed Mouse (*M. leucopus*), common in most parts of North America, and intermediate in its habits between the common mouse and the field mouse, is said to depart from houses whenever either the cat or the brown rat appears in them.—The Barbary mouse (*M. Barbarus*) approaches in size to the rats, and is distinguished by its longitudinally striped fur.

The name mouse is often popularly given to animals considerably different from the true mice, as the *voles* (q.v.).

MOUSE-EAR CHICKWEED, *Cerastium*, a genus of plants of the natural order *caryophyllaceæ*, having 5 sepals, 5 bifid petals, 10 stamens, 5 styles, and a capsule bursting at the top with 10 teeth. The species are numerous, natives of temperate and cold coun-

tries in all parts of the world. Some of them are among the most common weeds in Britain; others, having larger flowers, are occasionally planted in flower-borders and on rock-works. The form and hairiness of the leaves of some of the British species have given rise to the popular name.

MOUSSELINE. See MUSLIN, *ante.*

MOUTH, DISEASES OF THE, occur in different forms, but usually begin with inflammation of the mucous membrane. The inflammation may be equally diffused, or may be chiefly or entirely confined to the mucous follicles. When diffused, it may either present no peculiar secreted product, or the surface may be covered with a curd-like secretion, or with patches of false membrane. It may further be attended with eruption, ulceration, or gangrene, any one of which may impress a special character on the disease, or it may present peculiarities from the nature of its exciting cause, as when it accompanies scurvy, or is the result of mercurial action.

The following are the principal forms of inflammation of the mouth, or *stomatitis* (Gr. *stoma*, the mouth), as it is termed by nosologists. 1. *Common diffused inflammation*, which appears in reddened, somewhat elevated patches, and sometimes occupies large portions of the surface of the mouth. It is more commonly a complication of other diseases than an original affection. When of the latter character, it is generally caused by the direct action of irritants, as by scalding drinks, corrosive substances introduced into the mouth, accumulated tartar on the necks of the teeth, etc. In ordinary cases cooling and demulcent liquids (such as cream or almond oil) applied locally, an occasional saline cathartic, with a soft and chiefly farinaceous diet, constitute the whole of the necessary treatment.

2. *Diffused inflammation, with curd-like exudation*, is almost entirely confined to infants, and is described under its popular name of THRUSH.

3. *Inflammation of the follicles*, and *eruption or vesicular inflammation*, are described in the article apthæ (q.v.).

4. In *ulcerative inflammation, cancrum oris*, or *canker*, an ulceration often of considerable size, with a grayish surface and an inflamed edge, appears on the gums, or inside of the cheeks or lips. The swelling of the adjacent parts is often so considerable as to be apparent externally. There is a copious flow of saliva, and the breath is very offensive. The disease generally occurs in children from 2 to 6 years of age. The ulcer may continue for weeks, or even months, but always yields to treatment. The febrile symptoms and the constipation which are usually present must be combated in the ordinary way. Perhaps the best general method of treating the disease is by the administration of chlorate of potash (4 or 5 grains in sweetened water every 4 hours), and by frequently washing the mouth with a weak tepid solution of chlorinated soda.

5. The preceding affection is sometimes the first stage of a much more serious affection, viz., *gangrene of the mouth*, which usually occurs in children between the first and second dentition. A sloughing ulcer forms upon the gums, or some other part of the mouth. This slough spreads, the breath becomes extremely fetid, the disease extends to the alveolar processes, and the teeth are loosened and fall out. Inability to take food is followed by exhausting diarrhœa, and death is the usual termination. Unless taken in the early stage, when tonics and the local application of caustics may be serviceable, the disease is generally fatal.

Other affections of the mouth are noticed in the articles SALIVATION and SCURVY.

MOVABLE FEASTS. See EASTER; FESTIVALS, *ante.*

MOVABLES, in Scotch law, is the technical term to denote personal as contradistinguished from heritable property, one of the main distinctions of property being between these two classes. Heritage goes to the heir-at-law in case of intestacy, or what is equivalent to it, and movables go to the next of kin. See KIN. The term movables is thus not confined to corporeal things, as furniture, cattle, goods, etc., but includes debts, bills of exchange, rights of action, etc.

MOVEMENT CURE, a hygienic and therapeutic system for the preservation as well as the recovery of health, introduced by Peter Henry Ling, a native of Smaland, in Sweden, b. 1766. It is a modified form of gymnastics, and being systematized and specially adapted to the treatment of invalids in a reduced condition, possesses, in many respects, additional advantages to those afforded by ordinary gymnastics. The ancient Greeks and Romans, particularly the former, brought the science of gymnastics, in its purely hygienic relations and as adapted to the development of great strength and agility in healthy constitutions, to a great degree of perfection, as is attested by the power they possessed of performing wonderful feats of strength, endurance, and agility. But their Spartan-like processes would, if practiced upon invalids, particularly of the modern type, promote death rather than recovery. It is probable that the ordinary bodily exertions practiced by a normally educated man employed in active business pursuits are, in general terms, sufficient aids to the stimulation of the other functions of the body; but it must be confessed that normally developed and healthy men are exceptional. Civilization, with its competitions, strifes, and various requirements, has imposed restraints which interfere with and prevent normal development. The practice of ordinary gymnastics, or of the ordinary recreations, such as walking, rowing, boxing, horseback

riding, etc., would probably be sufficient for the restoration of functional equilibrium in a person simply jaded by over-work, and this method, because it employs unconscious exertion and perfect relaxation of mind, or essays to do so, is preferable; but, at the same time, it must be acknowledged that in very many cases an individual has formed habits of movement which are more or less abnormal. Many of his muscles, and groups of muscles, from habits formed in the prosecution of his business, have had but very little exercise; they are consequently sluggishly nourished, and do not eliminate effete matter in a manner suited to the requirements of the nerves which enter them, or of the general nervous system with which they are connected. Under such circumstances exercise requires to be systematized more than it is in the rapid and successive movements which take place in ordinary exercise or labor. The man is like a machine out of order: the mere setting in motion of which, if its parts are not completely deranged, will not produce repair. In some instances a patient who might be benefited by partial exercise, would be injured by bringing into action the whole body. These premises being admitted, it will be seen that what is called movement cure can, in many cases where ordinarily healthy persons are undergoing training, be advantageously conjoined with ordinary gymnastics. Ling started a genuine reformation; and he had the approbation of his sovereign in his efforts—a royal ordinance for the establishment of an institution being issued in 1814, and the Swedish government to-day acknowledges the advantages it derives from a governmental institution and from other private establishments of the kind. The natural exercise which is obtained by walking or riding, or moderate gymnastics, ought not to be too readily laid aside for problematic advantages of exercising distinct groups of muscles, unless such a course is very clearly indicated; but, at the same time, it must be borne in mind that many persons have been injured by over-exertion at the gymnasium. Although, as a general rule, unconscious exercise, such as is taken in genuine recreations, is preferable to that which is forced, it is claimed by those who have practiced the movement cure that there are cases in which conscious and directed movements are more beneficial than those which are unconscious; and this is not an unreasonable conclusion, if such movements are performed so as to render the exercise a diversion. One of the principles of the movement cure is that a muscle or a group of muscles shall not be exercised continuously for a long time, but that there shall be an interval or intervals of rest, during which assimilative nutrition takes place better than when the action is prolonged. Blood is drawn to the part, and during the succeeding resting spell the muscles grow, instead of wasting by continued exertion. Those who have an unbalanced muscular development, no doubt, in walking and riding, often over-work the weaker muscles, from the effects of which they afterward suffer discomfort, and miss the securing of the desired harmonious results. When, therefore, it is sought to restore weakened or disused muscles, great care ought to be taken not to overtax them, but to stop short of fatigue; but this is often incompatible with the taking of a walk or a ride of much length. The more correct physiological plan is, in certain cases, to let the general muscular system remain comparatively quiet, while intermittent and moderate movements are made with the special muscles under treatment. This will tend, after a while, to bring them up to a standard sufficient to enable them to take a fair share with the stronger muscles in the general movement of the body, so that by using the latter rather below their capabilities, and the former just enough for theirs, an equilibrium will at last be brought about. To secure this result various devices are practiced, one of the chief principles being that the patient may teach himself, or be taught, how to exercise particular muscles, or sets of muscles, without the aid of any apparatus, but while he is in a natural standing, sitting, or recumbent position. The muscles of the thighs, or of the legs, may be brought into action—and into strong action if it should be desirable—by an effort of the will, and that with scarcely any alteration in the posture. The gluteal muscles are readily brought into action during any position of the body. While lying upon the back, or upon the side, they are readily contracted, and may be held in such a state for any desirable length of time, and at any moment allowed a period of repose for the natural operation of assimilation. This is certainly philosophical practice, and that good results will follow it cannot be denied. The abdominal muscles can very advantageously be set in motion while one is lying upon the back by raising the head from the pillow, and repeating the operation as often as may be thought beneficial. But this exercise is not confined to the abdominal muscles, the pectoral muscles take a certain share, and also the diaphragm; but one peculiar benefit is derived from the stimulus given by the contracted abdomen walls to the involuntary muscles of the alimentary canal, which are usually, in cases calling for this mode of treatment, in a weakened and more or less torpid condition. It is frequently asked why physicians do not more often recommend such practice to their patients. A great part of a physician's duty lies in the treatment of acute diseases, which, as a rule, are not susceptible of cure by movements of the muscular system, and will not, in most cases, admit of such practice without hurtful results. When the body is poisoned by disease germs, as in many of the contagious fevers, there is an unnatural performance of functions which is incompatible with much voluntary motion. Sometimes, indeed, passive motion may be made with benefit, such as gently kneading the bowels, but, as a rule, rest, often absolute rest, is required; and, as the conditions of the disease usually involve the loss of some of the mineral constituents of the body, medicines judiciously adminis-

tered are of great importance. There is no doubt of the efficacy of quinine in the treatment of that poisoned condition engendered by miasm, nor of the beneficial effects attending the use of alkaline medicines in many febrile and inflammatory conditions. Many patients would die of gout and rheumatism but for the action of alkalies, and the almost sovereign power, in many cases of gout, of the plant called colchicum. There are conditions of the system in robust as well as delicate persons, when attacked by acute disease, in which the relief afforded by morphine, or some constituent of opium, would appear to be the only means of saving life. The principal occupation, therefore, of the general practitioner is in prescribing the ordinary therapeutic remedies and attending to those directions which concern the immediate necessities of the patient, such as diet, ventilation of the sick-room, rest and quiet; and there is a temptation to fall into routine habits, but this temptation is not as often yielded to as is supposed, or alleged. Indeed, it is a matter well understood among medical practitioners that, as a rule, it is impossible to prevail upon patients to follow hygienic prescriptions. They are told to ride on horse-back, to walk, to use dumb-bells and Indian-clubs, to go to the gymnasium, or to the movement cure; but they do not obey directions; they have no time. The merchant must attend to his business; his presence is needed on change, and not at the gymnasium, or at the movement cure, or anywhere, dressed in the attire of an athlete, or of an invalid. A lady has a multitude of domestic duties, or, if they are neglected, it is for society and its gayeties, or for pressing demands made upon her for benevolent or charitable work, or for the necessary attentions due to her neighbors and friends. A thousand counter-attractions cause the doctor's injunctions to be disregarded; and is it any wonder that his youthful enthusiasm becomes somewhat modified, and that, after a while, he submits to the necessity of employing such means only as he can carry out to the best advantage? The practice of movement cure is, however, attended with difficulties. There will be an unavoidable tendency to carry speculations and theories to an unwarrantable extent, and to give an indefinite multiplication of movements under an exaggerated idea of their importance, which often results in a want of confidence on the part of the patient in well-established but older methods, and leads him to neglect timely consultation with the general practitioner, or surgeon, in cases requiring active medical or operative surgical interference. On the other hand, there is probably not enough attention paid by many of the medical profession to movement methods of cure in cases of deformities, particularly to those of the spinal column. It would be unjust, however, to infer that such neglect is very prevalent. There are a great many surgeons, who, without calling public attention to their methods of treating deformities, are in the constant practice of deriving aid from muscular and passive movements of all kinds applicable to each particular case. Indeed, such practice furnishes the basis for the brilliant results which attend the practice of modern surgery, many of which are detailed in the history of cases published in numerous medical journals for the special benefit of the profession, and which are seldom seen by the public.

MOVERS, Franz Karl, 1806–56; b. Westphalia; received his theological education at Münster, where he also pursued the study of the Semitic languages. After being settled for six years over a church in Berkum, he was appointed professor of theology in the university of Breslau, where he remained till his death. His exhaustive work on the Phenicians, *Die Phönizier*, appeared in 4 vols. between 1840 and 1856, and is the standard authority upon its subject.

MOVILLE', a small market t. of Ireland, in the county of Donegal, on lough Foyle, 18 m. n.n.e. of Londonderry. It is a calling-station of the transatlantic steam-packets of the Anchor and Allan lines. Pop. '71, 1208.

MOVING PLANT, *Desmodium gyrans*, a plant of the natural order *leguminosæ*, suborder *papilionaceæ*, a native of India, remarkable, as are also some other species of the same genus, for the spontaneous motion of the leaves. The leaves are ternate, the lateral leaflets much smaller than the terminal one. These lateral leaflets are in constant motion, being elevated by a succession of little jerks till they meet above the terminal leaflet, and then moving downwards by similar rapid jerks to the leaf-stalk. Sometimes one leaflet is in motion and the other at rest. Sometimes a few may be seen moving, whilst there is a partial cessation in the other leaves of the plant. A high wind causes this cessation more than anything else; the movements are more languid in a very hot dry day, and are to be seen in their perfection in warm moist weather. The terminal leaflet does not remain absolutely at rest, although its movements are not like those of the lateral ones, but oscillates slowly from one side to the other. Concerning these remarkable movements, nothing more than the fact that they take place can yet be said to be known.

MOWATT, Anna Cora. See Ritchie.

MOWER, a co. in s.e. Minnesota, adjoining Iowa; drained by the Red Cedar, Upper Iowa, and Root rivers; traversed by the Southern Minnesota and Milwaukee and St. Paul railroads; 720 sq.m.; pop. '80, 16,799—11,864 of American birth. The surface is mostly prairie land, and wheat is produced in large quantities. Co. seat, Austin.

MOWER, Joseph A., 1830–70; b. Vt.; received a common education, and learned the trade of a carpenter. He entered the Mexican war as a private in a corps of engineers, and was commissioned as lieut. of 1st infantry in 1857; appointed capt. in 1861.

He fought in the early battles of the rebellion in Kentucky and Tennessee; received his appointment as col. of 11th Missouri vols. in May, 1862; was conspicuous in the capture of Island No. 10; severely wounded at the battle of Corinth, Oct. 4, and for a time in the hands of the enemy; promoted to be brig.gen. in Nov., 1862, and commanded a brigade at Vicksburg, where he displayed great bravery. He rose to the rank of maj.gen. in 1864, and commanded a division in Louisiana under gen. Banks; was called to assist Sherman in the Atlanta campaign, and, at the close of the war, was in command of the 20th corps. In 1866 he was appointed col. of 25th infantry, and placed in command in Louisiana, where he remained until his death in New Orleans.

MOWING AND REAPING MACHINES. See REAPING, *ante*.

MOX'A is a peculiar form of counter-irritation which was early practiced in the east, particularly by the Chinese and Japanese, from whom it was learned by the Portuguese. One or more small cones, formed of the downy covering of the leaves of *artemisia moxa* (as used by the Chinese), or of the pith of various plants (as of the common sunflower), or of linen steeped in niter, are placed on the skin over the affected part, and the ends remote from the skin are ignited. The combustion gradually proceeds through the cone and forms a superficial eschar on the skin. The surrounding parts must be protected by a pad of wet rag, with a hole in it for the moxa.

It may be employed with advantage in certain forms of neuralgia (especially obstinate sciatica) and in paralysis, and in chronic diseases of the joints. It is not much used in consequence of its apparent severity, but the pain is not so great as might be expected, and, according to some of its advocates, is less than often attends blisters.

MOXOS, or MOJOS, a nation of Indians in eastern Bolivia; civilized by the missionary fathers, but now much reduced in numbers and property. They have strong features, intelligent faces, and an independent manner; honest and religious; boatmen on the Mamore, the Madeira, and even to the Amazon. Their language was in contact with the Quichua and Aymara, both of which it resembles. Their early customs show a trace of Guarani influence, and it is probable that they were the farthest tribe in this direction under the control of the Incas.

MOYLAN, STEPHEN, 1734–1811; b. Ireland; emigrated to Philadelphia. Soon after the outbreak of the revolutionary war he went to Cambridge, Mass., where the American camp then was, and was selected by Washington as one of his aids-de-camp. He shortly resigned this office and entered the army as a volunteer. He led the 4th regiment of light dragoons in 1777, taking part in the battle of Germantown. He was attached to Wayne's expedition to Bull's ferry in 1780, and was with Greene in the south next year. In 1783 he was brevetted brig.gen. In 1792 and 1793 he was register and recorder of Chester co., Penn., and was afterwards commissioner of the district of Pennsylvania.

MOZAMBIQUE', a territory on the e. coast of South Africa, nominally belonging to Portugal, and placed under a governor-general, although the actual possessions of Portugal consist only of a few stations, and her authority in the country is inconsiderable. It extends from cape Delgado, in lat. 10° 41′ s., to Delagoa bay, 26° south. The chief river, the Zambesi, divides it into two portions—Mozambique proper on the n., and Sofala on the south. Area estimated at 283,500 sq.m.; pop. 300,000. These figures, however, are only to be considered approximative, as the country has no definite boundary to the west. The coasts, which comprise large tracts of cultivated soil, yielding rich harvests in rice, are fringed with reefs, islands, and shoals; and between Delagoa bay and cape Corrientes, and from Mozambique, the principal station, to cape Delgado, the shores are high and steep. The forests yield valuable ornamental woods; ivory is obtained from the hippopotami that haunt the marshes; and gold and copper are found and worked. The elephant, deer, and lion inhabit the jungle; crocodiles are found in the rivers, and numerous flamingoes on the coasts. The rainy season lasts from November to March. The summer heat is very great, and the climate, which is fine in the elevated tracts, is unhealthy on the low shores and the swampy districts. Besides numerous fruits and vegetables, the grains are rice, millet, maize, and wheat. The government is in a most inefficient state, being, in most places, more in the hands of native chiefs than of the Portuguese. In former times the slave-trade was carried on here extensively; and from 1846 to 1857 four governors-general were removed by their government for countenancing, if not actively engaging in it. The colony is divided into six districts, and is ruled by the governor-general and his secretary, assisted by a *junta*. Religion and education are supervised by about 12 Roman Catholic priests, but seem to be at the lowest ebb. Fish and turtle are caught in great quantities on the islands and reefs; pearl-fishing is a source of considerable profit; cattle, sheep, and goats are numerous, and the principal exports are grain, gold-dust, honey, tortoise-shell, cowries, gums, and amber. The Portuguese arrived here in 1497, attracted by rumors of the wealth of the country and the excellence of its ports. The principal settlements are Mozambique, Quilimane, Sena, and Tete.

MOZAMBIQUE, the capital of the Portuguese territory of the same name, is situated on a small coral island, on the eastern coast of Africa, close to the shore, in lat. 15° 2′ south. It is defended by three forts, is well built, and contains a large square in which

the palace of the governor and the custom-house are the chief buildings. Pop. 8,500, of whom 7,000 are slaves, 270 Christians, 102 Banyians from Hindustan, and 1150 Arabs. In former times all the markets of the world were supplied with slaves from Mozambique. Its commerce, now inconsiderable, is chiefly with India, and is carried on by Arabs.

MOZAMBIQUE CHANNEL, between the island of Madagascar and the south-eastern coast of Africa, is about 1000 m. in length, and about 450 in average breadth. At its northern extremity are the Comoro islands. Over the northern portion the monsoons blow. Black whales, yielding spermaceti, abound.

MOZARA'BIAN LITURGY, a liturgy—traced back by some to the apostles, but by the majority of writers to St. Isidore of Seville, who redacted it, in co-operation with the fathers of the 4th council of Toledo, 633—originally in use among those Christian inhabitants of Spain (Muzarabians, Mostarabians, Mustarabians) who remained faithful to their religion after the Arabic conquest. It is also called the Gothic liturgy, and differs in some respects from the Roman. Gregory VII. first compelled most of the Spanish churches and convents to adopt the common uniform liturgy of the Romish church. Six Mozarabic congregations alone, chiefly in Leon and Toledo, were allowed to retain their ancient ritual, but it soon fell into disuse even among these. Archbishop Ximenes of Toledo expressly founded a chapel at Toledo, in 1500, in which mass was to be said according to the Mozarabian manner, lest it might entirely fall into oblivion. He further caused a number of learned priests, Alfonso Ortiz among them, to collate all the different Mozarabian liturgical MSS. to be found in the different churches, chapels, and convents, and finally there was edited, under his auspices, the *Missale Mistum secundum Regulam Beati Isidori Dictum Mozarabicum* (1500–2), which has, however, by some unfortunate accident, remained incomplete. A whole third of the church-year is left out entirely. The peculiar affinity of this liturgy with the Gallican on the one, and the Greek on the other hand, makes its study extremely important for the history of the ancient church.

MOZART, Johann Chrysostom Wolfgang Gottlieb, one of the greatest of musical composers, was b. Jan. 27, 1756, at Salzburg, where his father was sub-director of the archiepiscopal chapel. His extraordinary musical talents were cultivated to the utmost by his father. At the age of four he played the clavichord, and composed a number of minuets and other pieces still extant. When only six years of age his performances were so remarkable that his father took him and his sister, who possessed similar gifts, to Munich and Vienna, where they obtained every kind of encouragement from the elector of Bavaria and the emperor Francis I. In 1763 and 1764 the Mozart family visited Paris and London. At the age of seven young Mozart surprised a party of musicians, including his father, by taking part, at sight, in a trio for stringed instruments. Symphonies of his own composition were produced in a public concert in London; and whilst there he composed and published six sonatas, and made acquaintance with the works of Handel, recently deceased. Two years later, when but 12 years of age, he composed the music for the religious service, and for a trumpet concert at the dedication of the orphan-house church in Vienna, and conducted it in presence of the imperial court. In 1769, at the age of 13 he was appointed director of the prince archbishop of Salzburg's concerts; and in the same year traveled with his father to Italy, where he created an unheard-of enthusiasm by his performances and compositions. He composed the opera of *Mithridates* at Milan, in Oct., 1770, and it was publicly performed there in December of that year. At the age of 16 he was the first claveçinist in the world; he had produced two requiems and a stabat mater, numerous offertories, hymns, and motetts, four operas, two cantatas, 13 symphonies, 24 pianoforte sonatas, not to speak of a vast number of concertos for different instruments, trios, quartets, marches, and other minor pieces. In 1779 he was appointed composer to the imperial court at Vienna, where he then fixed his residence, and there the musical works were composed upon which his great fame chiefly depends. His office in Vienna, however, was rather honorary than lucrative, and he lived by concerts, musical tours, teaching of music, and the small profits derived from the sale of his published works, till an offer of a large salary made to him by the king of Prussia led the emperor to give him 800 florins a year. His great opera of *Idomeneo* was composed in 1780, with a view to induce the family of mademoiselle Constance Weber, afterwards his wife, to consent to the marriage, which they had declined on the ground of his reputation not being sufficiently established. This opera forms an epoch not in the composer's life only, but in the history of music. In construction, detail, instrumentation, and every imaginable respect, it was an enormous advance on all previous works of the kind, and established his repute as the greatest musician whom the world had seen. *Die Entführung aus dem Serail* followed. His six quartets, dedicated to Haydn, appeared in 1785, and in 1786 *Le Nozze di Figaro*. In 1787 he produced his *chef-d'œuvre*, *Don Giovanni*, which, though received with enthusiasm at Prague, was at first beyond the comprehension of the Viennese. *Cosi fan Tutti* appeared in 1790. To 1791, the last year of his short life, we owe *Zauberflöte*, *La Clemenza di Tito*, and the sublime requiem composed in anticipation of death, and finished only a few days before his decease. He died Dec. 5, 1791, aged 35.

In the intervals of his greater works, Mozart composed the majority of the orchestral symphonies, quartets, and quintets, which are an almost indispensable part of the pro-

gramme of every concert in the present day, besides masses as familiar in England as in Catholic Europe, innumerable pianoforte concertos and sonatas, and detached vocal compositions, all of the most perfectly finished description. To Haydn, Mozart always acknowledged his obligations; but Haydn's obligations to Mozart are at least as great. Haydn, though born 24 years earlier, survived Mozart 18 years, and all his greatest works, written after Mozart's death, bear manifold traces of Mozart's influence. Mozart is the first composer in whose works all traces of the old tonality disappear; he is the father of the modern school. "No composer has ever combined genius and learning in such perfect proportions; none has ever been able to dignify the lightest and tritest forms by such profound scholarship, or, at the moment when he was drawing most largely on the resources of musical science, to appear so natural, so spontaneous, and so thoroughly at his ease." See the Lives by Holmes (Lond. 1845) and Jahn (Leip. 1856). The Life by Nohl (2d. ed. 1877) and the Letters have been translated by lady Wallace.

MOZDOK', a t. and fortress of South Russia, in the government of Caucasus, about 142 m. n. of Tiflis. Pop. '82, 11,000, chiefly Armenians.

MOZIER, Joseph, 1812–70; b. Vt.; removed to New York at 19 years of age, where he engaged in mercantile pursuits from 1831 to 1845, when he abandoned trade, and passed the rest of his life in Italy, where he studied art and became a sculptor. His principal works are: "Esther;" "The Wept of Wish-ton-Wish;" "Jephthah's Daughter;" "Pocahontas;" "Rebecca at the Well;" and "Rizpah."

MOZLEY, James Bowlingan, D.D.; 1813–78, b. Lincolnshire, Eng.; graduated at Oriel coll., Oxford, in 1834; elected fellow of Magdalen college, and became vicar of Shoreham, Sussex, in 1856; was appointed Bampton lecturer in 1865; canon of Worcester in 1869; regius professor of divinity, Oxford, in 1871. He is the author of *A Treatise on the Augustinian Doctrine of Predestination; Primitive Doctrine of Baptismal Regeneration; Review of the Baptismal Controversy; On Subscription to the Articles;* eight lectures on the *Miracles, being the Bampton Lectures for* 1865; *Essays, Historical and Theological, with an Introduction and Memoir of the Author; Ruling Ideas in Early Ages; Sermons, Parochial and Occasional; Theory of Development;* a Criticism of Dr. Newman's Essay on the Development of Christian Doctrine; *University Sermons,* preached before the university of Oxford, and on various occasions. Canon M.'s works are very highly esteemed.

MOZOOMDAR, Protap Chunder. See page 885.

MOZYR', a t. in the government of Minsk, in Russia, 150 m. s.s.e. of Minsk. It is a town of considerable antiquity, and played a rather important part in the wars between the various Russian princes, previous to the Tartar invasion. It was unsuccessfully besieged by the Tartars in 1240. Under the Polish rule it was the chief town of a district, and remained so after its annexation to Russia in 1795. 150 barges and 200 rafts are annually freighted here with goods to the amount of 500,000 rubles. Pop. '67, 5,250.

MSKET, also written Mtschetha, and otherwise, one of the most ancient Georgian towns in the present government of Tiflis, and about 10 m. n.n.w. of the town of that name. It is said to have been the seat of the Georgian kings down to the 5th c., and contained the first Christian church of Georgia, built during the first half of the 4th century. In this church the Georgian kings were crowned and buried. The site of Msket is now marked by a few huts.

MTESA, Emperor of Uganda, Africa. See page 885.

MTZENSK, a t. of Russia, in the government of Orel, 646 m. s.s.e. of St. Petersburg. It is situated on the Zusha, which communicates through the Oka with the Volga. The old cathedral, built on a steep rock, gives picturesqueness to the town. Mtzensk receives historical mention as far back as 1147. Its trade, chiefly with St. Petersburg and Moscow, amounts in value to upwards of 1,000,000 rubles. Pop. '80, 14,159.

MUCH WOOL'TON (i. e. *Great Woolton*), a t. of Lancashire, England, 6 m. from Liverpool. The town is rapidly increasing in size on account of the proximity of a branch of the North-western railway, which runs within two miles. Much Woolton has long been noted for a stone obtained from a neighboring quarry, which gives employment to a considerable number of men. Pop. '80, 4,539. Near Much Woolton is the village of Little Woolton, with a pop. of about 1000.

MUCILAGE, or Bassorin ($C_{12}H_{10}O_{10}$). is a modification of gum which is insoluble in water, but when moistened with it, swells up into a gelatinous mass. It is contained abundantly in gum tragacanth; and many seeds, such as linseed, quince seed, etc., and certain roots, such as those of the marsh-mallow, furnish it in large quantity. Alkalies render it soluble in water, and convert it into true gum; and prolonged boiling in water produces the same effect. Nitric acid converts it into mucic and oxalic acids.

MUCIUS, or Mutius, Scævola, the name and cognomen of an ancient Roman family, the founder of which was supposed to be the legendary Caius Mucius Scævola, about 600 B.C.; who after the expulsion of the Tarquins entered the camp of Lars Porsena, their ally, and attempted the assassination of the king; failing in his purpose, and brought before Porsena, to show his contempt for torture he thrust his right hand in the flames and held it there until consumed. The monarch, moved by his courage, released him, and in return Mucius (named Scævola, left-handed, from this deed) warned him that he was but one of 300 young men sworn to take his life. The result was that Por-

sena, in fear of death, offered favorable terms of peace to Rome. Several of the Mucii were distinguished in Roman history, attaining the positions of prætor, tribune, and consul. Quintus Mucius, the augur, was Cicero's teacher, and an eminent expounder of the Roman law. He was consul in 117 B.C. Quintus Mucius, the pontifex, was consul in 95 B.C., and was slain in 82 B.C. by the adherents of Marius; he also was a jurist and wrote a treatise on the *Jus Civile*, and a book on legal definitions.

MUCK'ERS, the popular name of an extraordinary sect, which sprung up at Königsberg, in Germany, in 1835. The movement seems to have originated in the dualistic and Gnostic views of John Henry Schönherr (who was born at Memel in 1771, and died at Königsberg in 1826) concerning the origination of the universe by the combination of two spiritual and sensual principles. His followers carried out his system much more completely than himself. The most notable of them were two clergymen, Ebel and Diestel, the former an archdeacon. By them, sexual connection would seem to have been elevated into an act of worship, and the chief means of the sanctification of the flesh; by which the paradisiac state was to be restored. Ebel and Diestel founded a society, to which women—some of noble birth—attached themselves. Three ladies lived in Ebel's house, who were popularly regarded as his three wives; and Mr. Hepworth Dixon, in his work entitled *Spiritual Wives* (1868), tells us that one of them, a young widowed countess, whose beloved husband had fallen on the field of Lützen, and whom he enticed from the seclusion and deep melancholy in which she lived, was described by him as representing to him the principle of light (*Licht-natur*); another of the ladies represented the principle of darkness (*Finsterniss-natur*); and the third represented the principle of union (*Umfassung*). The last was his legal wife, but held the most subordinate place in his extraordinary household. Ere long public feeling was excited against the Muckers, who were said to be guilty, under forms of piety, of the most odious licentiousness in their meetings. The scandal became great in Königsberg, and a garden there acquired the name of the Seraph's grove. The subject was brought before the courts (1839–1842), and the result was that Ebel and Diestel were degraded from their offices, and the latter was further punished by imprisonment. It is alleged, however, by some who have examined the whole evidence produced, that the decisions did not proceed upon a calm judicial inquiry, but were dictated by strong prejudice against the accused, on account of their religious views and peculiar eccentricities; and, in particular, that the evidence gives no support whatever to the charge of licentiousness. Mr. Hepworth Dixon has directed attention to the similarity of the Mucker movement with that of the Princeites (see AGAPEMONE) in England and that of the Bible Communists or Perfectionists (q.v.) in America, all of which took place about the same time, and in connection with revival excitement, although it may almost be regarded as certain that the originators of these movements had not even heard of each other.

MU'COUS MEMBRANES AND MUCUS. Under the term MUCOUS SYSTEM, anatomists include the skin, mucous membranes, and true glands, all of which are continuous with one another, and are essentially composed of similar parts. As the skin and the glands are described in special articles, it only remains to speak of the great internal mucous tracts. These are the alimentary mucous membrane, the respiratory mucous membrane, and the genito-urinary mucous membrane.

The *alimentary mucous membrane* commences at the lips, and not only forms the inner coat of the intestinal canal from the mouth to the anus, but gives off prolongations which after lining the ducts of the various glands (the salivary glands, the liver, and the pancreas) whose products are discharged into this canal, penetrate into the innermost recesses of these glands, and constitute their true secreting element. Besides these larger offsets we find in the stomach and small intestine an infinite series of minute tubular prolongations, the anatomical arrangement and function of which are described in the article DIGESTION.

The *respiratory mucous membrane* begins at the nostrils, and under the name of *schneiderian* or *pituitary membrane*, lines the nasal cavities, from whence it sends on either side an upward prolongation through the lachrymal duct to form the *conjunctiva* of the eye; backwards, through the posterior nares (the communication between the nose and the throat), it sends a prolongation through the Eustachian tube to the middle ear (the cavity of the tympanum), and is continuous with the pharyngeal mucous membrane (which is a portion of the alimentary tract); it then, instead of passing down the œsophagus, enters and forms a lining to the larynx, trachea, and bronchial tubes to their terminations. From the continuity of these two tracts, some writers describe them as a single one, under the name of the gastro-pulmonary tract.

The *genito-urinary mucous membrane* commences at the genito-urinary orifices, lines the excretory passages from the generative and urinary organs, and is the essential constituent of the glands of both. See KIDNEY, for example.

We thus see that mucous membranes line all those passages by which internal parts communicate with the surface, and by which matters are either admitted into or eliminated from the body. As a general rule, they are soft and velvety, and of a more or less red color, from their great vascularity, but they present certain structural peculiarities according to the functions which they are required to discharge. In all the principal parts of the mucous tracts we find the mucous membrane to present an external layer of

epithelium (q.v.) resting on a thin, transparent, homogenous membrane, which from its position is termed the *basement membrane*, and beneath this a stratum of vascular tissue of variable thickness, which usually presents either outgrowths in the form of papillæ and villi, or depressions or inversions in the form of follicles or glands, or both. The follicles are almost invariably present, but the papillæ and villi are limited to the alimentary or gastro-intestinal mucous membrane. "The mucous membranes," says Dr. Carpenter, "constitute the medium through which nearly all the material changes are effected that take place between the living organism and the external world. Thus, in the gastro-intestinal mucous membrane we find a provision for reducing the food by means of a solvent fluid poured out from its follicles: whilst the villi, or root-like filaments, which are closely set upon its surface towards its upper part, are specially adapted to absorb the nutrient materials thus reduced to the liquid state. The same membrane, at its lower part, constitutes an outlet through which are cast out not merely the indigestible residuum of the food, but also the excretions from numerous minute glandulæ in the intestinal wall, which result from the decomposition of the tissues, and which must be separated from them to prevent further decay. Again, the bronchio-pulmonary, or respiratory mucous membrane, serves for the introduction of oxygen from the air, and for the exhalation of water and carbonic acid. And, lastly, the mucous membranes are continuous with the cell-lined vesicles or tubes of the various glands, which are the instruments whereby their respective products are eliminated from the blood." Although the various kinds of epithelial cells discharge a special office in relation to the peculiar function of the mucous membrane upon which each kind occurs, yet they all serve one general purpose—namely, that of protecting the surfaces on which they are placed. This protecting power is increased by the presence of the secretion known as *mucus*, which ordinarily forms an extremely thin layer on these membranes, but when they are irritated or inflamed, is secreted in very considerable quantity. The exact mode of its formation is still a disputed question, but it is generally believed to be the product of the gradual solution of the uppermost epithelial cells. Besides acting both mechanically and chemically as a shield to highly sensitive membranes, it has other uses, amongst which two may be especially mentioned.—1. It communicates to the salivary, and probably to other glands, properties which are not possessed either by itself or by the pure glandular secretions: and 2. It serves to eliminate a considerable quantity of nitrogen from the system. This nitrogen is contained in the *mucin*, which forms from 2.4 to 9 per cent of nasal and bronchial mucus. This mucin contains 12.64 per cent of nitrogen, and is the substance which gives to mucus its viscid and tenacious character. Normal mucus is devoid of smell and taste, and almost, if not quite, neutral; and hence its constant presence in the mouth gives rise to no disagreeable sensation.

MUCORINI, an order of fungi very widely distributed, comprising chiefly what are known as the common moulds, which are found on decaying bread and other articles of food, or vegetable or animal matter generally. One species, *phycomyces nitens*, grows on greasy substances, a habitat not usual with most fungi. Most members of the order are very small, many of them microscopic. The *mucor mucedo* is one of the most common species and was particularly described by Dr. Brefeld in 1872. Fresh horse-dung kept in a moist place soon becomes covered with white glistening fibers, the mycelium of the *mucor mucedo*. They appear to flourish in decaying matter rich in nitrogen, and evolving ammonia. From the coating there project slight white threads, whose tips soon become black. These are the spore-bearing stalks, or *conidia*, and they manifest a strong tendency to turn toward the light which is not the case with the spore stalks of the common bread mould, they appearing to be indifferent to light. If the mycelium of *mucor mucedo* is kept moist it changes in form, and certain cross partitions increase in number, the cells produced in this way swelling into a spherical form. The protoplasm of the cells becomes developed into round bodies resembling spores, which have the power of germination. If the *mucor mucedo* is grown in a decoction of horse dung it bears only conidia. The principal genera are mucor, circinella, helicostylum, thamnidium, chætostylum, chætocladium, mortierella, piptocephalis, syncephalis, kickxella, cœmansia, martensella, and plobolus.

MUDAR, *Calotropis*, a genus of shrubs of the natural order *asclepiadaceæ*, distinguished by a coronet of fine blunt processes adhering to the base of the filaments. They are natives of the East Indies, and the bark of the root, and the inspissated milky juice of some of them, are much used there as an alterative, purgative, emetic, and sudorific medicine. The medicinal properties of mudar have been well known in India for many centuries, and have begun to attract the attention of European physicians. It is found of great value in elephantiasis, and in leprosy and other obstinate cutaneous diseases, as well in some spasmodic affections, and in syphilis.—The species most common in the south of India is *C. gigantea;* in the north, *C. Hamiltonii;* whilst *C. procera*, said to have an extremely acrid juice, extends into Persia, and even into Syria. Mudar is very common in India, springing up in uncultivated ground, and often troublesome in that which is cultivated. It is a large shrub, with stems often thicker than a man's leg; and broad fleshy leaves. It grows where almost nothing else will, on very dry sands, and rapidly attains a large size. The silky down of the pods is used for making a soft, cotton-like thread; but is short, and not easily spun. The inner bark also yields a strong

and useful fiber, which makes excellent cordage and fishing-lines; but the mode of preparation hitherto used makes it costly.—The inspissated milky juice of mudar collected by making incisions in the bark, is used as a substitute for caoutchouc and gutta-percha. It becomes flexible when heated.—The mudar of medicine contains a principle called *mudarine*, on which its medicinal virtues are supposed to depend, and which possesses the rare property of gelatinizing when heated, and becoming fluid when again cooled.

MUD EEL. See SIREN, *ante.*

MUD-FISH, *amia*, a very curious genus of fishes, forming the family *amiidæ* of the order *ganoidei* of Müller, although its position among the *ganoidei* is determined only by anatomical characters, in which it agrees with sturgeons and the rest of that order, for the scales are not ganoid, and are not osseous plates, but are flexible and rounded, and destitute of enamel. Similar scales, however, are found in fossil genera regarded by Agassiz as ganoid. In habit the mud-fish resembles osseous fishes rather than ganoids. Except in the absence of teeth on the tongue, the mouth resembles that of a trout. The body is long and flexible, with a bony vertebral column; there are two nasal cirri; the head is flat, covered with a very thin mucous skin, immediately under which the bones appear as sculptured plates. More than ten species are known, natives of the fresh waters of America. The WESTERN Mud-fish (*A. calva*) is from a foot and a half to three feet long, bluish-black above, white below. It inhabits the great northern lakes or North America, and is found as far s. as Carolina. It feeds chiefly on crawfish and other crustaceans. It is not esteemed as an article of food, although sometimes used by the Indians.

MUDGE, BENJAMIN FRANKLIN, b. Me., 1817; graduated at Wesleyan university, 1840; afterwards studied law and practiced in Lynn, Mass., for several years. He became interested in the coal-oil and petroleum trade in Kentucky; was state geologist of Kansas in 1864–65; and the professor of natural sciences in the Kansas agricultural college. He has made several paleontological discoveries.

MUDGE, ENOCH, 1776–1850; b. Mass., one of the pioneers of Methodism in New England. He entered the church at the age of fifteen, the Methodist ministry in 1793; traveled and preached in Maine in 1796; resided in Orrington, Me., and was twice chosen state representative. Subsequently he re-entered the itineracy, and was stationed in Boston. In 1832 he was appointed chaplain to the Seamen's Bethel, New Bedford, where he labored with great success until 1844 when on account of ill-health he retired from the ministry. He was highly esteemed as a preacher, fertile in thought, and rich in illustration. He published a vol. of sermons for mariners.

MUD-HEN. See COOT, *ante.*

MUD'KI, usually spelled MOODKEE, a small t. of n.w. Hindustan, 28 m. s.e. of the Sutlej, and 70 m. s.e. of the city of Lahore, on the Ravi. It has a pop. of about 6,000. Here the first battle in the Sikh war of 1845–46 was fought (Dec. 18, 1845), when the British under sir Hugh Gough repulsed the Sikhs, and sir Robert Henry Sale, "Fighting Bob," was killed.

MUËD'DIN (*Muëzzin*), the Arabic name of the Mohammedan official attached to a mosque, whose duty it is to announce the different times of prayer. His chant (adan) consists of these words, repeated at intervals: "Allah is most great. I testify that there is no God but Allah. I testify that Mohammed is the apostle of Allah. Come to prayer. Come to security." ["Prayer is better than sleep" is added in the morning, at the subh or fegr. See MOHAMMEDANISM.] "Allah is most great. There is no deity but Allah!" Besides these regular calls, two more are chanted during the night for those pious persons who wish to perform special nightly devotions. The first (ula) continues, after the usual adan, in this manner: "There is no deity but Allah! He hath no companion—to him belongeth the dominion—to him belongeth praise. He giveth life, and causeth death. And he is living, and shall never die. In his hand is blessing, and he is almighty," etc. The second of these night-calls (ebed) takes place an hour before daybreak, and begins as follows: "I extol the perfection of Allah, the existing for ever and ever: the perfection of Allah, the desired, the existing, the single, the supreme," etc. The office of a muëddin is generally entrusted to blind men only, lest they might, from their elevation, have too free a view over the surrounding terraces and harems. The harmonious and sonorous voices of the singers, together with the simplicity and solemnity of the melody, make a strikingly poetical impression upon the mind of the hearer in daytime; much more, however, is this the case whenever the sacred chant resounds from the height of the mosque through the moonlit stillness of an eastern night.

MUEZZIN. See MUËDDIN, *ante.*

MUFTI (Arabic, *expounder of the law*). The Turkish grand mufti is the supreme head of the ulemas (servants of religion and laws), and has, together with the grand vizier (vizier azim), the supreme guidance of the state, nominally ruled by the sultan. His is the chief spiritual authority, and in this capacity he is also denominated sheikh-al-Islam (lord of the faith). The imams (priests), however, chosen from the body of the ulemas, are, from the moment of their official appointment, under the authority of the kislaraga, or chief of the black eunuchs. The better class of the ulemas are the teachers and

expounders of the law, from among whom the mollahs and cadis are elected. The Turkish laws have their basis in the Koran; the mufti thus, as head of the judges, acquires a spiritual authority. His also is generally the office of girding the sultan with the sword at his ascension to the throne, a ceremony which takes place at the mosque of Eyub, and which is equal to our ceremony of coronation. The mufti is elected and may be deposed by the sultan, and his position has in modern days lost much of its former dignity and importance. His fetwa, or decision, although attached to the imperial decrees, imparts to it but little additional weight. Nor is his own dictum in things spiritual always considered as finally binding. The only prerogative of muftis and ulemas which has hitherto remained untouched is their being exempt from bodily or otherwise degrading punishments; nor can their property ever be confiscated, but descends to their successors.

MÜGGE, Theodor, 1806–61, b; Berlin. After devoting himself in early life to mercantile pursuits, at the age of nineteen he started for Peru to serve as a soldier with Bolivar. The news of the expulsion of the Spaniards reached him in London, and he returned to Berlin, where he studied history, philosophy, and the sciences, but lost his chances for a university professorship by the publication in 1831 of *France and the Last of the Bourbons* and *England and Reform*. His ultra-liberal sentiments, expressed in various newspapers and in his pamphlet *Die Censurverdältnisse in Preussen*, led in several instances to his arrest and political prosecution. He was associated with the staff of the *Zeitung für die Elegante Welt*, and for some time edited the *Nationalzeitung*, the only liberal journal of Prussia. In 1850 he began the publication of an annual, entitled *Vielliebchen*. During the twenty years preceding his death he poured forth a constant succession of sketches, tales, novels, and romances. His collected works amount to thirty-three volumes. The best-known of his later writings are *The Provost of Sylt*, *Christmas Eve*, *The Oldest Son of the Family*, and the posthumous romance *The Prophet*. He died in his native city of Berlin, where he occupied a prominent position.

MUGGLETO'NIANS, a sect that arose in England about the year 1651, and of which the founders were John Reeve and Ludovic Muggleton (b. 1607, died 1697), obscure men, but who claimed to have the spirit of prophecy. Muggleton was a journeyman tailor. He professed to be the "mouth" of Reeve, as Aaron was of Moses. They affirmed themselves to be the *two witnesses* of Rev. xi. They asserted a right to curse all who opposed them, and did not hesitate to declare eternal damnation against their adversaries. They favored the world with a number of publications, one of which—particularly directed to the parliament and commonwealth of England, and to his excellency the lord gen. Cromwell—was entitled a *Remonstrance from the Eternal God*. The prophets were at that time imprisoned as nuisances "in old Bridewell." Another publication was a *General Epistle from the Holy Spirit*, dated from "Great Trinity lane, at a chandler's shop, over against one Mr. Millis, a brown baker, near Bow Lane end, London." [The first complete edition of Muggleton's works was published in 1756; another edition appeared in 1832.] The Muggletonians denied the doctrine of the trinity; they held anthropomorphist opinions; and to all this they added many strange doctrines of their own, as that the devil became incarnate in Eve, etc. The Muggletonians existed in England as a sect till more than one-fourth of the 19 c. had passed away; but the census of 1851 showed no trace of them, and they are supposed to be now completely extinct.

MUGIL'IDÆ. See Mullet, *ante*.

MUHALITCH', or Mualich, a t. of Asia Minor, in Anatolia, 13 m. s. of the sea of Marmora, and 37 m. w. of Brusa, picturesquely situated on low hills. It is large and straggling, contains about 1500 houses and three or four khans, and is the seat of a considerable trade, chiefly in exporting silks, wool, and fruits to Constantinople. Pop. 11,000.

MUHESUR', a t. of India, in the territory of Indore (q.v.), on the right bank of the Nerbudda, 280 m. n.e. of Bombay. The fort contains many houses within its inclosure, but is in bad repair. There is a new palace, built of gray basalt, and overcharged with sculptures of human beings, and of elephants, tigers, and other animals. There are also numerous and costly Hindu temples, erected by Ahalya Bai, relict of Kunda Rao, son of Maharajah Mulhar Rao. The river, which is here about 2000 ft. wide, has a rapid stream of blue water, rushing over a rocky bottom; the banks are 60 or 80 ft. high in the dry season. Access to the water is gained by a ghât, or vast flight of stone stairs, which extends below the water at its lowest level. Pop. about 17,000.

MÜHLBACH, Luise. See Mundt, Klara (Müller).

MUHL'BERG, a t. of Prussian Saxony, situated on the Elbe, 36 m. s.e. of Wittenberg. Pop. '80, 3,461. Here on April 24, 1547, a battle was fought between Johann-Friedrich, elector of Saxony, and the emperor Charles V.—a battle fraught with the most important results to the cause of Protestantism in Germany. The battle was soon decided in favor of the emperor, Johann-Friedrich was taken prisoner, and his territories were handed over to Maurice, the representative of the ducal family of Saxony. From this time till 1552 the Catholics were triumphant in Germany.

MÜHLENBERG, Frederick Augustus, 1750–1801; b. Penn,; was the son of the rev. H. M. Muhlenberg; educated at the university of Halle; and afterwards

became a Lutheran minister in New York city. In 1779–80 and 1789–97 he was a member of congress from Pennsylvania. He was twice elected speaker of the house.

MUHLENBERG, Gotthelf Heinrich Ernst, D.D., 1753–1815; b. Penn.; entered the university of Halle at ten years of age, where he remained seven years; afterwards traveled in Germany and England; then returned to America, was ordained a Lutheran minister and became assistant pastor of a Lutheran church in Philadelphia, of which his father, Henry Melchior Muhlenberg, the founder of the German Lutheran church in America, was pastor. In 1777, during the occupation of Philadelphia by the British, he retired to the country, where he devoted himself to the study of botany; and it is as a botanist that he is best known. His chief works are, *Catalogue Plantarum, Americæ Septentrionalis*, and *Descriptis Uberior Gramineom.*

MUHLENBERG, Heinrich Melchior, D.D. 1711–1787; b. Einbeck, Hanover, then a free city of Germany. His parents were Saxon, but having suffered greatly in the thirty Years' war removed to Einbeck. His father was a member of the city council, and held a judicial appointment. His mother was the daughter of a retired officer, and a woman of sense, energy, and piety. By them the son was religiously trained. The death of his father occasioned an interruption of his studies. His early life was one of privation and toil. From his 12th to his 21st year he toiled incessantly to assist in the support of the family, yet improved every leisure hour for mental culture and the acquisition of knowledge. At the age of 21 he became tutor in the school of Raphelius at Zelleafeld. In 1735 he entered the university of Göttingen, where he remained three years. The influence of Dr. Oporin, who received him into his family, and employed him as an amanuensis, was excellent, and from that time he became an active Christian. Graduating at Göttingen he went to Halle, where, besides studying he taught in the orphan house. He associated intimately with Francke, Cellarius, and Fabricius. By their advice he decided to prepare for the missionary work, and Bengal was selected as the field of his operations. Soon after his ordination, and while making arrangements for his departure to India, application came from Pennsylvania to Germany for some one to be sent to labor among the destitute of that colony. The faculty immediately selected Muhlenberg, who was then in his 31st year. He reached America in 1742, to the great joy of the German Christians. He found the church in a deplorable condition, the Lutheran population having been much neglected. His arrival marked a new era in the history of the Lutheran church in the United States, its condition gradually improved, and frequent accessions were made to the ranks of the ministry, of men educated at Halle, and thoroughly devoted to their work. He took the pastoral care of the associated churches of Philadelphia, New Hanover, and Providence, which had united in calling a minister, and these three congregations were the principal scenes of his ministerial labors, though he preached in all the Lutheran churches of his day, and his aid was often requested from neighboring churches whose differences he seldom failed to reconcile. He often made long journeys to gather the scattered flock, preach the word, administer the sacraments, introduce salutary discipline, and perform other kind services. His influence was unbounded. The first three years of his ministry he resided in Philadelphia, the next 16 in Providence. In 1776 he resumed his charge in the country. During the war of the revolution his sympathy with the colonists excited great opposition, and his life was often in peril. Though advised to remove into the interior from the scene of hostilities, he refused. He was extensively known, and his views were well understood. Many of all classes, taking advantage of his position resorted to his house. "His home," says a contemporary, "was constantly filled with fugitives, acquaintances, and strangers, with the poor and hungry, noble and common beggars. The hungry never went away unsatisfied, nor the suffering uncomforted." At his death there was deep and widespread sorrow. In many places the bells were tolled, the churches shrouded in mourning, and funeral sermons delivered. Dr. Muhlenberg was a man of rare excellence. He possessed a combination of qualities which eminently fitted him for the duties to which he was called. Gifted by nature with great mental powers which were highly cultivated, he devoted himself fully to the fulfillment of his mission. His society was sought by the learned men of the day. The university of Pennsylvania conferred upon him the doctorate in divinity, rarely conferred in those days, and only upon those of unquestioned distinction.

MÜHLENBERG, Henry Augustus, 1782–1854; b. Penn.; pastor of a Lutheran church 1802–08. He was a member of congress 1829–38, serving on a number of the principal committees. In 1835 he was an unsuccessful candidate for governor on the democratic ticket. He was offered by president Van Buren the Russian mission, and the post of the secretary of the navy, both of which he refused. In 1838 he accepted the Austrian mission which he held until 1840.

MUHLENBERG, John Peter Gabriel, 1746–1807; b. Penn.; son of Dr. Henry M. He was educated at the university of Halle, from which he ran away, and passed a year as a private in the dragoons. He studied for the Lutheran ministry under his father, and was ordained in 1772. He was for a time settled over a church in Woodstock, Va. Soon after the beginning of the revolutionary war, he told his congregation in his last sermon that there was "a time for all things—a time to preach and a time to fight, and that now was the time to fight." At the close of the services, he tore off his gown,

showing himself in full uniform, and read from the pulpit his commission as col. He had the drummers strike up for volunteers, and many of his congregation volunteered and joined his regiment, the 8th Virginia, popularly known as the German regiment, afterwards noted for its courage and good discipline. In 1774 he was a member of the house of burgesses, and served on the committee of safety, and two years later he sat in the state convention. He participated in the fighting at Charleston in 1776, and was made brig.gen. the following year, and placed in command of the Virginia line. He took part in the battles of Brandywine, Germantown, and Monmouth, and in the capture of Stony Point. He defended Virginia against the expeditions of Leslie and Arnold, and was commander-in-chief there till the arrival of Steuben. Upon the invasion of Virginia by Cornwallis, he was next in command to Lafayette, and at the siege of Yorktown he was in command of the 1st brigade of light infantry. He retired at the close of the war with the rank of maj. gen. Soon after he settled in Pennsylvania, to whose executive council he was at once elected, and of which he was elected vice-president in 1785. He served in Congress in 1789–91, 1793–95, and 1799–1801. In the latter year he was elected U. S. senator, and in 1803 he was appointed collector of the port of Philadelphia.

MUHLENBERG, William Augustus, D.D., 1796–1877; b. Philadelphia; graduated at the university of Pennsylvania, 1814; ordained a minister of the Protestant Episcopal church in 1817; in 1817–21 assistant rector of Christ's church, Philadelphia, under bishop White; was rector of St. James's church, in Lancaster, Penn., 1821–28. Here he took an active part in establishing the first public school in the state out of Philadelphia. In 1828 he founded at Flushing, L. I., a school, afterwards called St. Paul's, and of which he was the principal until 1846. In 1846–58 he was rector of the church of the Holy Communion in New York, the earliest free Episcopal church. In 1858 he became superintendent and pastor of St. Luke's hospital, in New York, of which he was the founder. He had organized in 1845 the first Protestant sisterhood in the United States, which afterwards was in charge of this hospital. In the latter years of his life he was instrumental in founding an industrial Christian settlement at St. Johnland, L. I., near New York. He was an earnest advocate of Christian union. He was the author of the popular hymns, "I would not live alway," "Like Noah's weary dove," "Shout the glad tidings," and "Savior who Thy flock art feeding." He published *Church Poetry, being portions of the Psalms in verse, and hymns suited to the festivals and fasts, from various authors; Music of the Church,* in connection with bishop Wainwright; and the *People's Psalter.* He was a bright example of the mingling of earnest practical philanthropy with fervid devotion, and is held in honor by Christians of every name.

MUHLENBURG, a co. in w. Kentucky, intersected by the Paducah and Southwestern railroad; 570 sq.m.; pop. '80, 15,098—14,976 of American birth, 2,078 colored. In the n. portion the Owensboro' and Nashville railroad terminates at Owensboro' junction, or Stroud City, forming a junction with the Paducah and Southwestern railway. The Green river forms its n.e. boundary, the Muddy river its c., and a branch of the Green river its w. boundary. Its surface is hilly and well wooded, containing beds of bituminous coal and iron ore, which are extensively mined. Its soil is very productive, and adapted to tobacco, cotton, every kind of grain, and the raising of live stock. It has saw and grist mills, and tobacco factories. County seat, Greenville.

MÜHLHAUSEN, in Alsace-Lorraine. See Mülhausen, *ante.*

MÜHLHAU'SEN, an ancient city of Prussia, in the principality of Eichsfeld, on the Unstrut, 30 m. n.w. of Erfurt. It ranked in the middle ages as an important imperial free city, and is still an active center of commerce. It has manufactories for linen and woolen goods, starch, anise, and saffron works, and carpet and leather factories. Pop. '80, 23,748. Mühlhausen was deprived of its municipal independence in 1803, and made over to Prussia, with which it has since remained incorporated, excepting for a short period during the predominance of French influence in Germany, when, at the suggestion of Napoleon, it was included in the kingdom of Westphalia, but it was restored to Prussia in 1813.

MÜHL'HEIM, the name of two manufacturing towns of Rhenish Prussia, distinguished from each other as *M. an der Ruhr* and *M. am Rhein.* The former, situated on the river Ruhr, 16 m. n. of Düsseldorf, is a flourishing town, chiefly important on account of its trade in Ruhr coal. Excellent river-steamers are built here. Sandstone is extensively quarried, and iron-works and machine-factories are in operation. Cotton-spinning, weaving, printing, tanning, and paper-making are carried on. Pop. '75, 15,286. *M. am Rhein,* nearly opposite Cologne, carries on extensive manufactures of silk goods (employing 500 looms); there are dye works and paper and oil mills in operation, and considerable trade and commerce. Pop. '80, 20,420.

MUIR, John, b. Glasgow, 1810; educated in the university of Glasgow, and at the East India school at Haileybury, and engaged in the civil service in British India in 1828–53. He devoted himself to the study of Indian languages, history, and antiquities, and wrote religious tracts in Sanskrit verse. In 1853 he retired from the service and since that time has devoted his time and fortune to the advancement of oriental litera-

ture, especially in its bearing upon Christianity. Having, in 1846, offered to the university of Cambridge a prize of £500 for the best treatise on the errors of the Hindu systems of philosophy, and expounding the principles of Christianity to learned natives of India, he gave, in 1862, £5,000 to the university of Edinburgh for the endowment of a professorship of Sanskrit and comparative philology. He has done much to help the spread of Christianity among the Hindus. He has not only contributed to the transactions of Asiatic and other learned societies, but has published *Original Sanskrit Texts on the Origin and History of India, their Religion and Institutions*, 5 vols., a work of much learning and very useful to the students of Sanskrit and Indian literature.

MUIR, Sir WILLIAM. See page 886.

MUIRBURN, in Scotch law, is the crime of setting fire to heather. Neither owners nor tenants, except in high and wet lands, are entitled to set fire to heather betweem April 11 and Nov. 1, though at other times they may. And persons who willfully fire heather are liable to be fined and imprisoned. In England, maliciously setting fire to heaths is one of the heads of the generic offense of arson (q. v.).

MUKDEN', or MOUKDEN, in lat. 41° 50′ 30″ n., long. 123° 37′ e., the capital of Shêng-king, the chief province of Manchuria. Its Chinese name is Tungtien-foo, signifying *affluent capital*, a translation of the Manchu Moukden, meaning *flourishing*. It lies on a branch of the river Liao, about 500 m. n.e. of Peking. The town is surrounded by a wall about 10 m. in circumference, including an inner wall 3 m. in circuit, inclosing the emperor's summer residence. Great pains have been taken by the emperors to enlarge and beautify this the metropolis of the Manchu race, but with only partial success. The family residence and place of sepulture of the founders of the reigning dynasty is Hing-king, about 60 m. e. of Mukden. It is pleasantly situated in a mountain valley near the palisade which separates the province from Kirin. The emperor Kienlung rendered himself celebrated among his subjects, and the city of Mukden better known abroad by a poetical eulogy upon the city and province, which was printed in 64 different forms of Chinese writing. In 1631 Mukden became the seat of government of the Manchu emperors, and is now the seat of several superior tribunals of a Chinese viceroy of the first rank. Nineteen leagues from Mukden is its port, Niuchwang, or Newchwang (more correctly known as Ying-tz, i.e., "camp" or "military station"), which has been opened recently to foreign commerce. It is shallow, difficult of access, and during many months of the year closed by ice. Pulse, cattle, and drugs are its chief exports. The trade with Great Britain is steadily developing, and forms already about one-third of the whole. According to the consular reports for 1875, the total value of the exports for that year amounted to £895,900 (only £13,300 for foreign ports); the total value of imports was £941,500 (£580,000 from foreign countries). Coal and iron are worked in the province, and find a market in Newchwang. Total value trade, 1880, £1,960,000.

MUKHTAR PASHA, b. in Turkey 1837, and generally believed to have been a natural son of the sultan, Abdul Medjid. He was educated at the Constantinople military school; was rapidly promoted and became successively professor and governor of the school. In 1862 he served as a staff officer in the Montenegrin campaign, and subsequently in minor troubles with the Arabs. At the breaking out of the Bosnian insurrection he was made governor-general of Bosnia and Herzegovina, where he had some success, but incurred a severe defeat at Duja Pass, and in the Montenegrin campaigns of 1876 had, on the whole, but small success. In 1877 Mukhtar had charge of the campaign against Russia in Asiatic Turkey, and on April 29 was defeated and driven from Kars; but in a number of severely contested battles during the next two months, his troops displayed great courage and regained the position. On Oct. 11, the Russians gained an important victory over Mukhtar, driving him back to Kars, and soon afterwards to Erzeroom. The fall of Kars practically decided the war, and before the end of the year Mukhtar was recalled, and replaced by Ismail Kurd pasha.

MULATTO. See MIXED RACES.

MULBERRY, *Morus*, a genus of trees of the natural order *moraceæ*, natives of temperate and warm climates, with deciduous leaves, unisexual flowers in short, thick spikes, a 4-parted perianth, containing either four stamens or one pistil with two styles, the perianth of the female flowers becoming succulent and closing over the small pericarp, the whole spike coalescing into an aggregate fruit.—The COMMON MULBERRY, or BLACK MULBERRY (*M. nigra*), is a native of the middle parts of Asia, but was introduced into the s. of Europe more than a thousand years ago, and is now almost naturalized there. It is a low tree, much branched, with thick rough bark and broad heart-shaped leaves, which are unequally serrated and very rough. It is cultivated in the middle parts of Europe, and succeeds well in the s. of England, but in the northern parts of Britain it requires a wall. The perianth and stigmas are roughly ciliated, and the fruit is of a purplish-black color, with dark red juice, fine aromatic flavor, and subacid sweet taste. The fruit is much esteemed for dessert; an excellent preserve and a pleasant light wine are made of it. The tree often produces its fruit in prodigious quantity. The wood is employed in cabinet-work, but is not of much value. The leaves are sometimes used for feeding silk-worms The black mulberry lives long; trees still existing in England are known to be more than 300 years old. It is propagated by seed, by suckers, by layers, or by cuttings. It succeeds best in a rich light soil.—The WHITE MULBERRY (*M. alba*)

is a native of China, and has been there planted from time immemorial for the sake of its leaves, which are the best food for silk-worms; on which account also it has been cultivated in the s. of Europe since about 1540. In North America it does not succeed further n. than lat. 43°, being somewhat more impatient of frost than the black mulberry. The perianth and stigmas are smooth; the fruit is almost white, and is much less palatable than that of the black mulberry, although in this respect there is great difference among the many varieties. A rob made of it is useful in sore throat. The best variety for feeding silk-worms, on account of its rapid growth and abundant leaves, is that called the PHILIPPINE MULBERRY. In India the white mulberry is treated as a bush, and cut down twice a year; the shoots, stripped of their leaves, being thrown away, although the bark has long been used in China and Japan for making paper. It grows readily from cuttings. The root has a considerable reputation as a vermifuge.—The RED MULBERRY (*M. rubra*), a native of North America, abounding particularly on the lower parts of the Missouri, endures severe frosts much better than either of the preceding, and is therefore preferred for cultivation in some parts of Europe. Its fruit is deep red, and almost as pleasant as the black mulberry. The wood is much more valuable; being fine-grained, strong, and adapted even for ship-building. The tree attains a height of 60 ft. or more.—The INDIAN MULBERRY (*M. Indica*) has black fruit of a delicate flavor, and the leaves are extensively used for feeding silk-worms in China, Cochin-China, and Bengal.—*M. atro-purpurea* has been introduced into India from China for feeding silk-worms. *M. Mauritiana*, a native of Madagascar and Mauritius; *M. celtidifolia* and *M. corylifolia*, Peruvian species; *M. Tatarica*, a native of Central Asia; *M. lævigata*, the species most common in the n. of India; and *M. Cashmeriana*, a native of Cashmere, produce pleasant fruit; M. *dulcis*, a native of the n. of India, is said to be superior in flavor to all others.

The PAPER MULBERRY (*Broussonetia papyrifera*) differs from the true mulberries in having the female flowers collected in a globular mass. The tree is of moderate size, or, in cultivation, a bush of 6–12 ft. high; with leaves either simple or lobed, a native of India, Japan, and the islands of the Pacific ocean, but now not uncommon in pleasure-grounds in Europe and North America. The islanders of the Pacific cultivate the paper mulberries with great care. They make a kind of clothing from the bark, using for this purpose the bark of small branches about an inch in diameter, which they macerate in water, and then, scraping off the epidermis, press and beat the moist slips together. The paper also, which is used in Japan and many parts of the east, is in great part made from the bark of the young shoots of this plant, which for this purpose is boiled to a pulp, and treated somewhat in the same way as the pulp of rags in Europe. When the shoots are cut, new ones spring up very rapidly.—Silk-worms eat the leaves of the paper mulberry.—The fruit is oblong, of a dark-scarlet color, sweetish, but insipid.

MULDER, GERARD JOHANNES, a distinguished living chemist, was b. in 1802 at Utrecht, where his father was practicing as a physician. After obtaining the degree of doctor of medicine at the university of his native town in 1825, he commenced the practice of his profession at Amsterdam, where he was appointed to teach botany, and subsequently chemistry, in the newly-established medical school of that city. In 1841 he was elected professor of chemistry at the university of Utrecht, in consequence of the ability he had displayed in various memoirs published in the Dutch scientific journals. He is best known to the general reader as the discoverer of proteine (q.v.), which he maintains to be the main ingredient of albumen, fibrin, casein, etc.; but the existence of which as an independent chemical compound is at the present day not generally admitted. He is the author of numerous excellent works on physiological and agricultural chemistry, on the chemistry of wine and beer, on diet and nutrition, etc., which, in consequence of their being written in Dutch, are far less known in this country than they deserve. His *Chemistry of Vegetable and Animal Physiology* has been translated into English by Dr. Fromberg, and his *Chemistry of Wine* by Dr. Bence Jones.

MULE (Lat. *mulus*, supposed to be connected with Gr. *molos*, labor, and with Eng. *moil*), a hybrid animal, the offspring of the male ass and the mare, much used and valued in many parts of the world as a beast of burden. The ears are long; the head, croup, and tail resemble those of the ass rather than those of the horse; but in bulk and stature the mule approaches more nearly to the horse. The mule seems to excel both the ass and the horse in intelligence; it is remarkable for its powers of muscular endurance; and its sure-footedness particularly adapts it to mountainous countries. It has been common from very ancient times in many parts of the east; and is much used also in most of the countries around the Mediterranean sea, and in the mountainous parts of South America. Great care is bestowed on the breeding of mules in Spain and Italy, and those of particular districts are highly esteemed. In ancient times the sons of kings rode on mules, and they were yoked in chariots. They are still used to draw the carriages of Italian cardinals and other ecclesiastical dignitaries. Both in Spain and in South America mules employed to carry burdens are driven in troops, each preceded by an animal—in South America usually an old mare—called the *madrina*, or godmother, to the neck of which a little bell is attached, and the mules follow with the greatest docility. When troops mingle in their halting-places or elsewhere, they are readily separated, as they recognize at once the sound of their own bell. Mules are comparatively little used in Britain,

although it is alleged that work is done at less expense by the employment of mules than by the employment of horses.

As in other hybrid animals generally, males are more numerous among mules than females, in the proportion, it is said, of two or three to one. There is no instance on record of offspring produced by two mules; but instances occur, although rarely, of their producing offspring with the horse and with the ass. The mule is very superior in size, strength, and beauty to the hinny, the offspring of the male horse and the female ass.

MULE. See SPINNING.

MULEY-HASSAN, SIDI. See page 886.

MULFORD, ELISHA, D.D., LL.D. See page 886.

MULGRAVE, CONSTANTINE JOHN PHIPPS, Lord, 1744–92; b. England; son of baron Mulgrave, an Irish peer. He entered the British navy at an early age, and was made post-captain in 1765. He was returned to parliament as member for Lincoln in 1768, and distinguished himself in the debates on libels and on the Westminster election; on the latter subject he published a pamphlet. In 1773 he started, with two ships, on an exploring expedition towards the n.e. Arctic regions, and was stopped by ice at 80° 48′ n. lat. He gave an account of this voyage in his *Journal of a Voyage towards the North Pole*, 1774. He was appointed commissioner of the admiralty, and in 1790 raised to the British peerage as baron Mulgrave.

MULGRAVE, HENRY PHIPPS, first earl of, viscount Normanby, 1755–1831; b. England: served in the British army through the revolutionary war. He afterwards became a member of Pitt's cabinet, was conspicuous for his opposition to Roman Catholic emancipation, was appointed first lord of the admiralty in 1807, and five years later was made earl of Mulgrave and viscount Normanby.

MULGRAVE, JOHN SHEFFIELD, Earl of. See BUCKINGHAM, or BUCKINGHAMSHIRE, DUKE OF.

MULGRAVE ISLANDS, an archipelago in the Pacific ocean, lying between lat. 3° s. and 12° n. and long. 160° and 177° e.; composed of the groups of Brown, Raiick, Radack, Scarborough, and Kingsmill. The name is also applied, in a more limited sense, to the small group of the Radack chain, which was examined by lieut. Percival in 1825. The group forms a circular chain of narrow strips of land, about half a mile wide, inclosing an inland sea 140 m. in circumference. The islands are low and of a coral formation.

MULHAUSEN (Fr. *Mulhouse*), a town of Germany, in the imperial territory of Alsace-Lorraine. Pop. '80, 63,629. Mülhausen is built on a small island between the Ill and the Rhone and Rhine canal, and is an important station on the Strasburg and Basel line of railway. It lies in a fertile, well-watered district, and ranks as one of the most active centers of trade in Alsace; while it is also the seat of a tribunal of commerce, and of various mercantile and trade unions, which have exercised a beneficial influence on the industrial activity of the country, Its numerous manufactories produce superior woolen and fine cambric goods, excellent leather, morocco, and carpets; in addition to which, its printing and dye works for cotton, muslin, wool, and silk fabrics are almost unrivaled in regard to the delicacy of the colors and elegance of the patterns employed. Mülhausen has extensive bleaching-works, and is noted for its cotton and woolen stocking manufactories, its breweries and distilleries, starch and straw works, and for its iron-works, in which locomotives and various forms of steam-engines are extensively manufactured. These manufactures, together with corn, wine, and brandy, form the staple articles of its very extensive trade.

Mülhausen early acquired commercial importance, having been erected into a free imperial city by Rudolph of Hapsburg in 1273. By siding with some of the Swiss cantons in the 14th c., it was enabled to maintain a certain degree of neutrality in the feuds between the empire and France. In 1523 Mülhausen adopted the reformed faith. It remained a part of the circle of the upper Rhine till 1798, when it was incorporated with France. It became a town of the German empire after the war of 1870–71.

MULL, after the isle of Skye, the largest of the inner Hebrides, belongs to the county of Argyle, and is washed on the w. and s. by the Atlantic, and bounded on the n.e. by the sound of Mull. It is triangular in shape, hollowed on the w. side by an inlet of the Atlantic, and is deeply indented by sea-lochs, of which the principal are Loch-na-Keal and Loch Screidan. Area about 237,000 statute acres, of which 12,470 are arable; pop. '71, exclusive of the neighboring islets, 5,947. Its surface is for the most part occupied by mountains, generally rounded in outline, and rising in Ben More 3,185 ft. high. Of its fresh-water lakes, Loch Erisa and Loch Ba are the chief. Wood abounds in the north; but owing to the generally tame character of the mountains, the great stretches of moorland, and the absence of well-defined valleys, the scenery, with the exception of that on the coast, is uninteresting. The land under cultivation occurs chiefly on the shores and at the heads of the several lochs. The soil is unusually fertile; but the great humidity of the climate, and the frequency and violence of the gales, render it almost wholly unfit for agriculture. The land is principally laid out in stock-farms, and great numbers of cattle, sheep, and horses are reared and exported. Chief town, Tobermory (pop. 1344), in the north. The harbor of Tobermory is one of the best and safest in the Hebrides. A low-water pier was completed here in Mar., 1864. It enables steamers to land in any state of the tide. The sound of Mull, 20 m. long, by 2

m. in average breadth, separates the island from the mainland of Argyleshire on the north-east.

MULLA'NY, J. R. M., b. N. Y., 1818; entered the navy in 1832, and was made lieut. in 1844. In the Mexican war, he was stationed on the coast of Mexico. He was appointed commander in 1861, and was captain of the *Oneida* at the battle of Mobile bay, Aug. 5, 1864, was severely wounded, and lost his right arm. He became commodore in 1870, and rear-admiral in 1874.

MULLEIN, a genus of plants (*verbascum*) of the natural order scrophulariaceæ, consisting of tall, more or less woolly, biennial or perennial herbs with flowers in dense spikes or terminal racemes. Calyx five-parted, corolla somewhat unequally five-lobed, wheel-shaped, five woolly stamens, and a two-celled, two-valved, many-seeded capsule. Three European species, *V. blattaria*, *V. lychnitis*, and *V. thapsus*, have been naturalized in North America, and in Europe the leaves and flowers of two allied species, *V. thapsiforme*, and *V. phlomoides*, are also collected. The only species growing in North America which is used in medicine is *V. thapsus*, the common mullein, so often met in pasture-fields and on roadsides. It has leaves from 8 to 12 in. long, the upper ones sessile, and all decurrent, varying in shape from elliptic to oblong and oval-lanceolate; more or less crenate on the margin, and thickly covered with soft white hairs. They have but little smell, are mucilaginous, and have a faintly bitter taste. The corolla and the adhering stamens are the only part of the flower which is collected for the shops generally. The corolla is about 1½ in. broad, the three upper stamens having filaments covered with white wool; the two lower ones longer and smooth, with elongated decurrent anthers. The flowers are thoroughly dried and kept in dry, well-stoppered bottles, which preserves their delicate color; dampness causes them to turn dark. Morin obtained from them a trace of a yellowish volatile oil, a fatty substance, sugar, and coloring matter, which is insoluble in ether and cold water, but yields an alcoholic solution which gives a yellow precipitate when treated with a solution of acetate of lead. The leaves (*folia verbasci*) furnish the principal medicinal properties of the plant, but the flowers are used to make poultices, and the whole flower, with the peduncle, is often used by the Germans to make a gargle for ulcerated sore throat. An infusion of the leaves is used in catarrhal affections of the respiratory organs and the bowels, and in cystitis oil impregnated with the volatile oil of the flowers is used in Germany for frost bite and hemorrhoids.

MULLEN, Tobias, D.D. See page 886.

MULLENS, Joseph, D.D., 1820–79; b. London, entered Coward college in 1837; took the degree of B.A. in 1841 at the university of London; was ordained in 1843, and the same year embarked for Calcutta as a missionary of the London missionary society. He prepared statistics of the missions in India and Ceylon, and visited the mission. In 1858 he visited England. In 1865, being invited to be assistant secretary with Dr. Tidman, he returned to England after visiting the missions in India and China. At Dr. Tidman's death he became sole foreign secretary. In 1870 he was sent as a delegate of the London society to the American board. After an absence of 15 months under commission to visit the Madagascar mission, he published *Twelve Months in Madagascar*. The directors having accepted from Mr. Arthington, of Leeds, in 1875 a liberal offer of help for a new mission on lake Tanganyika, central Africa, Dr. Mullens accompanied the party, to direct the organization of the new mission. Arriving at Zanzibar, he concluded to go into the interior. The exposure and fatigue prostrated him, and he died of peritonitis, July 10. Dr. Mullens received the degree of D.D. from Williams college, Mass., in 1861, and from the university of Edinburgh in 1868. Besides the work on Madagascar, he published *A Brief Review of Ten Years' Missionary Labor in India, between* 1852 and 1863; *London and Calcutta compared in their Heathenism, Privileges, and Prospects.*

MÜLLER, Charles Louis, b. Paris, 1815; studied art at the school of fine arts, and with Gros and Cogniet. He was director of the Gobelin tapestry factories 1850–53, and became Flandrin's successor at the school of fine arts in 1864. His first exhibited picture was "Christmas Morning" (1837). His greatest work is "The Appeal of the Victims of the Terror." Among his other works may be mentioned "The Martrydom of St. Bartholomew," "Desdemona," and "Lanjuinais at the Tribune" (1869).

MÜLLER, Ferdinand von, Baron, b. Germany, 1825; educated at Kiel. He went to Australia in 1847, and for the next 5 years was engaged in botanical explorations. In the latter year he was appointed government botanist of the colony of Victoria. He was director of the Melbourne public garden 1857–73. He is the author of *Fragmenta Phytographiæ Australiæ; Plants of Victoria; Flora Australiensis*, 6 vols.; and other works. The king of Würtemberg ennobled him, in 1871.

MÜLLER, Friedrich, a German philologist; b. at Jennik, Bohemia, 1834; studied in Vienna in 1853–57: was librarian there in 1858–66; became in 1869 professor of comparative philology and Sanskrit at the university, and a member of the academy of sciences. He is considered one of the highest authorities in comparative philology and ethnology, and has contributed largely on these subjects to periodicals. His principal works are *Reise der oesterreichischen Fregatte Novarra; Linguistischer Theilr; Ethnographischer Theil; Allgemeine Ethnographie.*

MÜLLER, Friedrich Max (Maximilian), one of the most eminent living orientalists, was born at Dessau, in the duchy of Anhalt-Dessau, Dec. 6, 1823. His father,

Wilhelm Müller, distinguished not only for his worth as a man, and his extensive and thorough scholarship, but as one of the first German lyric poets, was librarian of the ducal library, but died prematurely, Oct., 1827. Müller received the elements of his education at Dessau, and then went to Leipsic, where, under prof. Hermann Brockhaus, he began the study of Sanscrit. This he soon chose as his special pursuit; and the first fruits of his labors appeared in a translation of the *Hitopadesa* (Leip. 1844). In 1844 he went to Berlin to study under Bopp and Shelling, and consult the Sanscrit MSS. to be found there. In Paris, whither he repaired in 1845, be began, at the instigation of Burnouf, to prepare for an edition of the Rig-Veda, with the commentary of Sâyanâcârya. With this view he came to England, June, 1846, to examine the MSS. in the East India house, London, and the Bodleian library at Oxford; and, on the recommendation of the late prof. H. H. Wilson, the East India company commissioned him (1847) to edit the Rig-Veda at their expense. The first volume of this great undertaking, printed at the Oxford university press, appeared in 1849; and the sixth and concluding volume was published in 1874. In 1850 Müller was appointed deputy Taylorian professor of modern languages at Oxford; in 1854 he succeeded to the professorship; and in 1858, was elected a fellow of All Souls. While pursuing his labors connected with the Rig-Veda, Müller has published treatises on a variety of philological topics, which have done more to awaken in England a taste for the science of language in its modern sense (see GRAMMAR) than the labors of any other single scholar. Inheriting the poetic imagination and fire of his father, Müller has at command such a felicity of illustration, that subjects dry under ordinary treatment, become in his hands attractive. He has published a translation into German of Kâlidâsa's *Megha-dûta* (König. 1847); *The Languages of the Seat of War in the East* (2d ed. Lond. 1855); *Comparative Mythology* (in the Oxford Essays for 1856); *History of Ancient Sanscrit Literature* (2d ed. Lond. 1860); lectures on *The Science of Language* (1861–63) lectures on *The Science of Religion* (1870). *Chips from a German Workshop*, in 4 vols., was published 1868–75; the Hibbert lectures on *The Origin and Growth of Religion*, in 1878; *Selected Essays*, in 1881. He is author of a romance, *German Love*, originally issued in Germany. He is editor of the important series *The Sacred Books of the East*, is one of the 8 foreign members of the institute of France, and has received the degree of LL.D. from Cambridge and Edinburgh.

MÜLLER, GEORGE, b. Kroppenstädt, Prussia, in 1805; was sent between the ages of 10 and 11 to the cathedral classical school at Halberstadt to prepare for the university. At the age of 15 he left the school and read the classics with Dr. Nagel. After spending $2\frac{1}{2}$ years at the gymnasium of Nordhausen, he entered the university of Halle, and obtained permission to preach in the Lutheran church. In 1826 he began preaching, fired with a missionary zeal, "living for two months in free lodgings provided for poor students in divinity." He wrote to a titled lady of Frankfort of known liberality for a temporary loan; no answer came; but he received the amount asked from some one who had heard of his application, with an anonymous letter written in a very Christian tone. In June, 1828, he was invited to London by the society for promoting Christianity among the Jews, to engage in its service for six months; but, as the Prussian law required from him three years military duty, he was unable to accept. But a severe illness rendering him unfit for military service, he was exempted, and in Mar., 1829, reached London. He studied Hebrew and Chaldee, Becoming ill he went to Teignmouth for medical aid. Unable to conform to the discipline of the Jews' society, he ceased to be one of its students in 1830. He then settled as pastor of Ebenezer chapel, laboring also in Bristol. He gave up pew rents, and depended on voluntary gifts, for which a box was placed in the chapel. Often reduced to a few shillings he made known his wants "to the Lord only," and they were supplied. In 1834 he and his co-laborers established the scriptural knowledge institution for home and abroad, "to assist day schools, Sunday-schools, and adult schools, to supply cheap Bibles, and aid missionary societies." In Dec., 1835, after a visit to the continent, he published a proposal for the establishment of an orphan house for destitute children bereft of both parents. In a second statement, dated Jan. 16, 1836, he said: "It is intended to receive the children from the 7th to the 12th year, and to let them stay in the house till they are able to go to service. Spontaneous offers of money and service were received, and the opening of the home was announced May 18, 1836. By May, 1837, there were 64 children in the two houses, and at the end of that year Mr. Müller published the first part of his narrative. At the end of 1838, there were 86 orphans in three houses; at the end of 1856, there were 297. He wrote: "Without any one having been personally applied to for anything by me the sum of £84,441 6s. $3\frac{1}{4}$d. had been given to me for the orphans, as the result of prayer to God." He states how this has been expended, and he acknowledges the gifts sent to him for his own use. The number of orphans increased, and the buildings were multiplied until in 1875, "2,000 children were lodged, fed, and educated, without a shilling of endowment, without a committee, without organization, by funds drawn from all parts of the world." In addition to the support of his orphans, Mr. Müller through his institution sustains "numerous foreign and home missionaries and schools, and provides for the circulation of vast numbers of the Scriptures and religious tracts," refusing to make any appeal, or hold any meetings, relying on the efficacy of faith and prayer. Believing that he is an instrument in God's hand, working by faith and prayer, he says he issues no advertise-

ments or handbills of any of his services. His *Narrative* and other books and pamphlets have a large sale, and are among the means for giving information of his work. He is rightly held in high esteem for sincerity of character and grand usefulness: his work is its own testimonial both as to its Christian sources and its practical results. It is suggested by some that his advertised abstinence from all advertisement and solicitation is itself the most moving solicitation to the public heart; and that while his success is to be surely counted an answer to prayer, the prayer in this case, no less than in others, is answered in the use of the adequate instrumentalities.

MÜLLER, Gerhard Friedrich, 1705–83; b. Germany; educated at Leipsic. Entering the newly established St. Petersburg academy, he gave instruction in history, geography, and Latin, and was soon appointed professor of history. In 1740 he went to Siberia, where he remained 10 years engaged in the study of its antiquities and geography. On his return, he became historiographer to the empire, and, in 1766, keeper of the national archives. He drew up for the government a collection of its treaties, and wrote a number of works on Russian history, whereon he was the first authority. His most important book, a *Collection for the History of Russia,* appeared at St. Petersburg, in 9 vols., from 1722 to 1764.

MÜLLER, Johann, historian of Switzerland, was b. Jan. 3, 1752, at Schaffhausen, where his father was clergyman and rector of the gymnasium. He studied at Göttingen under Heyne, Schlözer, Walch, and others. In 1772 he was appointed professor of Greek at Schaffhausen, and in the same year published his first work, *Bellum Cimbricum* (Zür. 1772). Already he had commenced to devote his leisure hours to the investigation of Swiss chronicles and documents. By the advice of his friend Bonstetten, he went to Geneva in 1774, where he became a private tutor; and also (1778) delivered a series of lectures on "Universal History," afterwards published in 24 volumes. In 1781 he was called to the Collegium Carolinum at Cassel, as professor of statistics, and a little earlier published the first volume of his great work, *Geschichte der Schweizer.* In 1786 he was appointed librarian and councilor of state to the elector of Mainz; here he finished the 2d volume of his Swiss history; his *Darstellung des Fürstenbundes* (Leip. 1787); and *Briefe zweier Domherren* (Frankfürt, 1787). In 1792 he went to Vienna, where the emperor Leopold gave him a situation in the privy council, and, in 1800, appointed him first imperial librarian. In 1804 he left Vienna for Berlin, where he wrote *Ueber die Geschichte Friedrich's I., Ueber den Untergang der Freiheit der Alten Völker, Versuch über die Zeitrechnungen der Vorwelt,* and an additional volume of his Swiss history. Introduced to Napoleon after the battle of Jena, he was appointed by him (1807), having been previously dismissed from the Prussian service, secretary of state in the new kingdom of Westphalia; but died at Cassel, May 29, 1809. Müller's *Sämmtliche Werke* were published, 27 vols. Stuttgart, 1810–19; new edit., 40 vols., 1831–35.

MÜLLER, Johann, one of the most eminent physiologists of the present century, was b. at Coblenz on July 14, 1801. He began to study with a view to orders in the Roman Catholic church; but in 1819 he abandoned his theological studies and devoted himself to medicine, taking, in 1822, the degree of doctor of medicine at Bonn. Whilst yet a student, he wrote for a prize the treatise *De Respiratione Fœtus* (Leip. 1823). He became, in 1824, a tutor; in 1826, an extraordinary, and in 1830, an ordinary professor of physiology and anatomy at Bonn; and in 1833 succeeded Rudolphi as professor of anatomy at Berlin. His physiological researches were most industriously prosecuted, and were rewarded by many discoveries, which obtained for him a high reputation in the scientific world. He died of apoplexy at Berlin, April 28, 1858. His works are numerous, and many of them occupied with particular topics in zoology and comparative anatomy. Among the most important are—*Zur vergleichenden Physiologie des Gesichtssinns des Menschen und der Thiere* (Leip. 1826); *Grundriss der Vorlesungen über die Physiologie* (Bonn, 1827); *Grundriss der Vorlesungen über allgemeine Pathologie* (Bonn, 1829; *De Glandularum Secernetium Structura Penitiori earumque prima Formatione in Homine atque Animalibus* (Leip. 1830); *Ueber die organischen Nerven der erectilen männlichen Geschlechtsorgane,* etc. (Berlin, 1835); and *Handbuch der Physiologie des Menschen* (2 vols. 4th ed. Coblenz, 1851). "Manual of the Physiology of Man," which has been translated into French and English. He was also the author of a large number of dissertions on a variety of subjects connected with physiology, the most important of which have been separately published. His latest investigations, on infusoria, were published in 1860. The most eminent living physiologists of Germany received their training in his school.

MÜLLER, Johann, early German mathematician. See Regiomontanus, *ante.*

MÜLLER, Johann Friedrich Wilhelm, 1782–1816; b. Germany; studied engraving under his father, Johann Gotthard, at Stuttgart, and at the academy and the Louvre in Paris. In 1808 his engraving of "St. John about to write his Revelation," after Domenichino, won him a high reputation, which was maintained by his "Adam and Eve under the Tree of Life," after Raphael. In 1814 he was appointed professor of engraving in the Dresden academy, and the rest of his life was devoted to the execution of the plate of his greatest work, the "Madonna di San Sisto," after Raphael's picture of that name, in the Dresden gallery. His engravings are only 18 in number, mostly portraits,

including Schiller, Jerome Bonaparte, the king of Würtemberg, the poet Jacoby, and a medallion of Napoleon I.

MÜLLER, Johann Gotthard von, 1747–1830; b. Würtemberg; educated at the Stuttgart art academy, where he showed such a talent for design that he was allowed to give up his studies for the church, for which he had been intended, and make art his profession. He at first studied under the court painter Guibal, but, developing a talent for engraving, went to Paris in 1770, where, for six years, he studied under the engraver Wille. There he won a number of prizes, and was elected a member of the French academy. In 1776 duke Karl recalled him to Stuttgart, where he taught for 9 years, when he was summoned to Paris to engrave a portrait of Louis XVI., by Duplessis. Next in importance to this is his engraving of Trumbull's "Battle of Bunker Hill." He became professor of engraving on his return to Stuttgart, where his son Johann Friedrich was his most proficient pupil. He was elected a member of the principal European academies, and was knighted in 1818. Besides those mentioned, his best works are a "Madonna della Leggiola;" a "St. Catherine with two Angels," after Leonardo da Vinci; and a "Schiller," after the portrait by Graf.

MÜLLER, Julius, a German theologian, was b. at Brieg, April 10, 1801, and was a brother of Charles Otfried Müller (q.v.), the antiquary. He studied at Breslau and Göttingen, at first devoting himself to law, but afterwards to theology. After much mental struggle he adopted religious views opposed to those of the rationalists. In 1825 he was appointed pastor at Schönbrunn and Rosen, near Strehlen, where he remained 7 years. Having acquired a high reputation for theological learning, he was appointed in 1831 second university preacher in Göttingen, and there lectured on practical theology and pedagogics. The spirit in which he labored there may be seen from his sermons, entitled *Das Christliche Leben, seine Kämpfe und seine Vollendung* (The Christian Life, its Struggles and its perfection; Bresl. 1834; 3d ed. 1847). In 1834 he became extraordinary professor of theology in Göttingen, and soon after ordinary professor in Marburg, from which he went in 1839 to occupy a similar chair in Halle. The work on which his reputation as a theologian chiefly rests is that on sin, *Die Christliche Lehre von der Sünde* (Bresl. 1839; 4th ed., revised and much altered, 2 vols., 1858), which has been translated into English. He afterwards published pamphlets on subjects of temporary interest, particularly in vindication of the cause of evangelical union against the attacks of the rigid Lutherans. He died Sept. 27, 1878. It was he who, in 1850, in conjunction with Neander and Nitzsch, edited a periodical entitled *Deutsche Zeitschrift für Christliche Wissenschaft und Christliches Leben.* He also contributed to the *Theol. Studien und Kritiken.* His work *Die Evangelische Union* appeared in 1854. He died in Oct., 1878.

MÜLLER, Karl Otfried, one of the most genial, richly erudite, and industrious classical archæologists of modern times, was b. Aug. 28, 1797, at Brieg, in Silesia. He was the son of a clergyman, and received a careful education. He studied at Breslau and Berlin. His taste for philological and archæological studies was early developed. The first fruit of his learning was the publication of the *Aegineticorum Liber* (Berl. 1817), after which he soon received an appointment to the *Magdalenum* in Breslau, where his leisure hours were devoted to a grand attempt to analyze the whole circle of Greek myths. In 1819 he obtained an archæological chair in Göttingen; and to thoroughly prepare himself for it, visited the collections in Germany, France, and England. His great design was to embrace the whole life of ancient Greece, its art, politics, industry, religion, in one warm and vivid conception—in a word, to cover the skeletons of antiquity with flesh, and to make the dry bones live. With this view he lectured and wrote with a fine earnest animation, until the political troubles in Hanover made his position uncomfortable. He obtained permission to travel, and made tours in Greece and Italy, but unfortunately died of an intermittent fever at Athens Aug. 1, 1840. Müller's literary and scholarly activity stretched over the whole field of Greek antiquity. We are indebted to him for many new and striking elucidations of the geography and topography, literature, grammar, mythology, manners, and customs of the ancients. His work on the Dorians (*Die Dorier*, translated into English by sir George Cornwall Lewis and Henry Tuffnell) forms the 2d and 3d vols. of his *Geschichte Hellen, Stämme und Staaten* (new and improved ed. 3 vols. Bresl. 1844); his treatise *Ueber die Wohnsitze, Abstammung und ältere Geschichte des Macedon. Volks* (Berl. 1825); his *Etrusker* (2 vols. Bresl. 1828); and his maps of Greece, are works of the highest importance in the departments of ancient history and ethnology. His *Handbuch der Archäologie der Kunst* (Bresl. 1830, 3d ed. 1846; English by Leitch, London, 1850) is full of learning and of acute original observations. His *Prolegomenen zueiner wissenschaftlichen Mythologie* (Gött., 1825) led the way to a strictly historical explanation of the ancient myths. The work by which he is probably best known in England is his *History of the Literature of Ancient Greece* (Lond. 1840), undertaken at the request of the British "society for the diffusion of useful knowledge." Müller died before finishing it; what he had finished was translated into English by sir George Cornwall Lewis and Dr. Donaldson, the latter of whom continued the work from where it left off—at the age of Alexander—down to the taking of Constantinople. The German original was published by Müller's brother (Bresl. 1841). He showed himself also an acute and judicious critic in his editions of Varro, *De Linguâ Latinâ*, Festus, *De Significatione Verborum*, etc. His contributions to periodicals, encyclopedias, etc., were

likewise numerous and valuable.—MÜLLER, JULIUS, brother of the preceding, was born at Brieg, Apr. 10, 1801, educated at Breslau, Göttingen, and Berlin, and after holding several offices, finally became a professor of theology at Halle. His best known work, *Die Christliche Lehre von der Sünde* (The Christian Doctrine of Sin; English, Edin. 1856), is considered by theological critics the most acute and profound treatise written in modern times on this mysterious subject.

MÜLLER, OTHON FREDERICK, 1730–84: b. Copenhagen; became tutor to a young nobleman, with whom he traveled over Europe, studying natural history. In 1763 he published a work on fungi, which was followed by two works on the insects and plants of the district where he lived. The titles of these works were: *Fauna Insectorum Friedrichsdaliana*, 1764; and *Flora Friedrichsdaliana*, 1767. He was then appointed by Frederic V. of Denmark, to continue the *Flora* of Denmark, of which work Oeder had published 3 vols. to which Müller added two. In 1771 he published in German a treatise *On Certain Worms Inhabiting Fresh and Salt Water*. In this work he gives an account of the structure and habits of annulose animals. His *Vermium Terrestrium et Fluviatilium seu Animalium Infusoriorum, Helminthecorum, et Testaceorum non Marinorum, succincta Historia*, which appeared between 1773 and 1774, describes the infusory animalcules, of which he discovered many new species, and which he was the first to divide into genera and species. It also contains a classification of the testaceous mollusca. In his *Hydrachnæ in Aquis Daniæ Palustribus Detectæ et Descriptæ*, 1785, he describes a large number of minute animals hitherto unknown. In 1777, he published a catalogue of the animals of Denmark, under the title of *Zoologicæ Danicæ Prodromus*. In 1779 he began the publication of his *Zoologia Danica*, which was intended to correspond in the animal kingdom, with his *Flora* in the vegetable; but only two parts were ever published. In 1786 was published, edited by his friend Otho Fabricius, a posthumous work on the infusory animalcules.

MÜLLER, PEDER ERASMUS, 1777–1834; b. Copenhagen; studied at the university there, passing his theological examination 1791. After spending 18 months at some of the German universities he visited France and England. Returning he wrote numerous works, was appointed professor of theology in 1801; bishop in 1822; in 1830 bishop of Zealand, the highest ecclesiastical position in Denmark. He was an eminent theologian, and his theological works on *The Christian Moral System; Grounds for Belief in the Divinity of Christianity; Creeds of the Christian Church*, all in Danish, are very highly valued; but his literary reputation rests upon his essays on Danish and Norse antiquities. Of these the most valuable are, *On the Importance of the Iceland Language; On the Rise and Decline of Icelandic Histonography; On the Author of the Edda of Snórro; Critical Examination of the Last Seven Books of Saxo Grammaticus; Critical Examination of the Traditional History of Denmark and Norway;* and above all his *Sagabibliothek*, or *Library of the Sagas*, 3 vols. In this he gives an analysis of the contents of all the Icelandic *sagas* or *stories* now existing. He was the editor in 1805–30 of the *Danish Literary Gazette*, the oldest literary journal in Denmark, and one of the only three in Europe, which have been continued for a century without interruption.

MÜLLER, SOPHIE, 1803–30; b. Mannheim; a distinguished German actress. She made her first appearance on the stage in her 15th year. She acted at Vienna, Dresden, and Berlin, where her performances were highly applandad. She was also reader to the empress of Austria.

MÜLLER, WILHELM, 1795–1827; b. Germany; educated at the university of Berlin, where he cultivated philology and early German literature. After serving in the Prussian army through the campaign of 1813, he devoted himself to the study of literature, and especially of early German poetry; as a result of the latter study, his *Blumenlese aus den Minnesänger* appeared in 1816. It was followed, two years later, by a translation of Marlowe's *Doctor Faustus*. After spending some time in Vienna, where he learned modern Greek, he made an Italian tour, of which he gave an account in his *Rom, Römer, and Römerinnen*. Returning to Germany, he was appointed teacher of classics in the Dessau school, and librarian of the ducal library. His literary reputation was raised to a high pitch by the publication of his *Gedichte aus den Hinterlassenen Papier en Eines Reisen den Waldhornisten*, in 1824, and his *Lieder der Griechen* the next year. He particularly excelled in the composition of what are called by the Germans *Reiselieder* or *Wanderlieder*, lyrics of travel and out-door life. He contributed to *Urania*, and other periodicals, and to encyclopædias. He was the father of Max Müller.

MULLER, WILLIAM JOHN, 1812–45, b. England; studied landscape under the painter J. B. Pyne, and made a sketching tour through Germany, Switzerland, and Italy. His first exhibited picture of "Peasants on the Rhine" was not successful, and to improve himself in his art he made a long tour through Greece and Egypt, studying the remains of ancient architecture. In 1840 he exhibited at the academy pictures of "Athens" and "Memnon," which showed great progress. Two years afterwards his "Picturesque Sketches of the Age of Francis I." gave him a high reputation. In 1843 he joined sir Charles Fellows in the expedition to bring the Xanthian marbles to London. As a result of this journey he exhibited in the academy of 1845 five pictures: "Head of a Cingari;" "Tent Scene;" "Turkish Merchants;" "The Burial Ground at Smyrna," and

"Cannon of the Knights Templars." These pictures were hung to such a disadvantage as to escape the attention of most of the spectators; and Muller is said to have died from chagrin in consequence. He exhibited at the British institution, the year of his death, a "Dance at Xanthus," and a "View of Rhodes." Of his other works, some of his earlier landscapes, and his later "Sphinx" and "Prayers in the Desert," deserve mention. His pictures have commanded high prices since his death.

MULLET, *Mugil*, a genus of acanthopterous fishes, the type of the family *mugilidæ*. In this family, the body is nearly cylindrical, the scales are large; there are two widely separated dorsal fins the first of which has only four stiff, sharp spines; the teeth are extremely fine; the gullet is closed by an extraordinary development of the pharyngeal bones, so that only soft and thin food can pass down it; a branch of the stomach forms a kind of gizzard. The best-known of this family belong to the genus *mugil*, of which there are many species. They have a small mouth, with a fold or crest in the under lip, which fits into a corresponding notch in the upper one. The Common Mullet, or Gray Mullet (*M. capito*), is found in the Mediterranean, and along the western shores of Europe, as far as the southern and south-eastern shores of England, but becomes rare further north. The common mullet is usually about 15 in. in length, but sometimes two feet. The color is steel gray on the back, with bluish and yellowish reflections; the belly silvery white; the flanks with six or eight longitudinal lines of rosy brown. It often ascends rivers, generally selecting soft or fat substances for food, and often seeking food by thrusting its mouth into the soft mud. It is most readily taken by a bait of the boiled entrails of fish, or cabbage boiled in broth. It is easily reared in ponds, and readily answers the call which usually summons it to be fed. It is highly esteemed for the table.—A very nearly allied species, also called Gray Mullet (*M. cephalus*), a native of the Mediterranean, is distinguished by having the eyes half covered with an adipose membrane, and by a large triangular scale pointing backwards, just over the origin of each pectoral fin. It attains a larger size than the former species, sometimes 10 or 12 lbs. weight. It enters the mouths of rivers at certain seasons, and ascends into the fresh water. It is the most esteemed of all the mullets, and was in great request among the ancients. Enormous prices were given by the Romans for unusually large mullets, the price increasing, like that of diamonds, far more rapidly than the size. Mullets are used fresh, salted, and smoke-dried. A preparation of their roe, called *botarcha*, is in great esteem as a condiment in Italy and the s. of France. Mullets are often caught in the Mediterranean by angling from a rock, with a bait paste, when they have been previously attracted to the spot by macaroni thrown into the water. A third species of Gray Mullet (*M. chelo*) is not unfrequent on the coasts of England, and even of Scotland. It is remarkable for its large fleshy lips. It swims in great shoals. In the Mediterranean it sometimes attains the weight of 8 lbs. The American Mullet (*M. albula*) is very like the common mullet, but more slender, the tail large and forked. It abounds about the Bahama islands, and extends far northwards. It is highly esteemed for the table.

The name mullet is also given to the genus *mullus* of the family *percidæ*. See Surmullet

MULLET, or Mollet, in heraldry, is a charge in the form of a star, generally with five points, intended to represent a spur-rowel, and of frequent occurrence from the earliest beginnings of coat-armor. Gwillim, sir George Mackenzie, and Nisbet lay it down that mullets should always oe pierced to represent the round hole in which the spur-rowel turns, but this has been by no means uniformly attended to in practice. Much confusion exists in blazonry between mullets and stars; in England the rule most generally adopted is that the mullet has five points, whereas the star has six, unless any other number be specified. Nisbet lays down a canon nearly the converse of this, which has never been adhered to; and in Scottish heraldry the same figure seems to be often blazoned as a mullet or a star, according as it accompanies military or celestial figures. The mullet is the mark of cadency assigned to the third son, "to incite him to chivalry." The word mullet is occasionally used in heraldry for the fish so called.

MULLIDÆ. See Surmullet, *ante*.

MULLINGAR', chief t. of the co. of Westmeath, in Ireland, is situated on the great western road from Dublin to Galway, distant from the former, with which it is connected by the Royal canal and the Midland Western railway, 50 m. n.n.w. Its pop., in 1871, was 5,103, of whom 4,090 were Roman catholics, 886 Protestants of the Episcopal church, the rest members of other denominations. It is the center of a poor-law union of forty-eight divisions, comprising an area of 208,401 acres. Mullingar is a place of little historical interest, although its immunities date from the reign of Elizabeth. Its public buildings are in no way remarkable, but it possesses several schools; among the number, one recently endowed for general educational purposes. It is without manufactures, but has considerable celebrity as the site of several of the most important horse and cattle fairs in Ireland.

MULLION, the upright division between the lights of windows, screens, etc., in Gothic architecture. Mullions are rarely met with in Norman architecture, but they become more frequent in the early English style, and in the decorated and perpendicular are very common. They have sometimes small shafts attached to them, which carry the

tracery of the upper part of the windows. In late domestic architecture they are usually plain.

MULLINS, William, 1575–1621; b. in England, adopted the principles of the Puritans, and with them took refuge first in Holland and then in America. He was a man of wealth, had much influence in deciding upon the movements of the colonists, and was one of the signers of the celebrated compact drawn up on the *Mayflower*. The severe New England winter proved too much for his health and he died about six months after the landing at Plymouth rock; his wife and children soon followed him, with the exception of a daughter, Priscilla, the heroine of Longfellow's *Courtship of Miles Standish*; and from the marriage of John Alden and Priscilla Mullins are descended a number of eminent men of our own day.

MÜLLNER, Amadeus Gottfried Adolf, 1774-1829, b. in Saxony, took a degree in jurisprudence at Leipsic, and practiced law. He wrote a number of works on legal topics, and also novels and dramas. Two of his dramas, *Der Neunundzwanzigste Februar* and *Die Schuld*, were once very popular, but are now forgotten.

MULOCK, Dinah Maria. See Craik.

MULREADY, William, r. a., was b. at Ennis, in Ireland, about the year 1786. When a boy he went to London with his parents; at the age of fifteen entered as a student in the royal academy, and made good progress, aiming at first at the classic style, or what, according to the notions of the day, was called high art. Following the bent of his genius, however, he soon relinquished this course, and devoted himself to the study of nature and the works of those artists who attained high reputation in a less pretentious walk of art. His first pictures were landscapes of limited dimension and subject, views in Kensington gravel-pits, old houses at Lambeth, and interiors of cottages. He next essayed figure-subjects of incidents in every-day life, such as "A Roadside Inn," "Horses Baiting," the "Barber's Shop," and "Punch" (painted in 1812), "Boys Fishing" (1813), "Idle Boys" (1815). Mulready was elected an associate of the royal academy in Nov., 1815, and an academician in Feb., 1816; a strong proof of the high estimation in which his talents were held by his brethren, for the higher dignity is rarely conferred till after a probation of several years as associate. Even in his earliest time his works were characterized by much elaboration; but those he executed about the middle period of his career exhibit an extraordinary amount of finish and greater brilliancy of coloring, qualities that he carried further and further as he advanced in years; and though he lived to a great age (he died on July 7, 1863), he continued to work with undiminished powers till within a day of his death. A great number of Mulready's best works now belong to the public, as portions of the Vernon and Sheepshanks's collections. In the first-named there are four pictures, one of these, "The Last in, or Truant Boy," exhibited in 1835, being one of the most elaborate works of his middle period; while in the Sheepshanks' collection there are no fewer than twenty-eight of his works, among which, "First Love," exhibited in 1840, is a remarkable example of refinement in drawing, and delicacy of feeling and expression. "The Sonnet," exhibited in 1839, is perhaps his highest effort in point of style; and by "The Butt—Shooting a Cherry," exhibited in 1848, is best exemplified the remarkable minuteness of his finish and richness of his coloring. An edition of the *Vicar of Wakefield*, published in 1840, by Van Voorst, embellished with twenty wood-cuts from Mulready's drawings, is a very fine work. "Women Bathing" was exibited in 1849; and, in 1852, "Blackheath Park." "The Toy Seller," a large picture exhibited the year before he died, was unfinished, and not at all equal to earlier and smaller ones, but remarkable as the work of a man whose artistic efforts had been lauded sixty years before.

MULTAN', or *Mooltan*, an ancient and important city of India, in the Punjab, on a mound consisting of the ruins of ancient cities that occupied the same site, three miles from the left bank of the Chenab—the inundations of which sometimes reach Multan—and 200 m. s.w. of Lahore. It has railway communication with all the principal towns of India—Calcutta, Bombay, Madras, Peshawar, etc. The city is surrounded by a dilapidated wall, from forty to fifty ft. in height. The vicinity abounds in mosques, tombs, shrines, etc., attesting alike the antiquity and magnificence of the former cities; and the country around is remarkable for its fertility. Multan is a military station, with a small redoubt in the rear of the cantonment. Its bazaars are numerous, extensive, and well stocked; and its shops, 6,000 in number, are well supplied with European and Asiatic commodities. Manufactures of silks, cottons, shawls, scarfs, brocades, tissues, etc., are carried on, and there is an extensive banking trade. The merchants of Multan are proverbially esteemed extremely rich. Steamers ply between this city and Hyderabad, a distance of 570 m.; and the Indus Valley railway opens up a commercial outlet from central Asia, the Punjab, and the North-West provinces, to the Arabian sea by Hyderabad and Karachi. In 1849 Multan was taken by the British troops under gen. Whish, and annexed with its territory to the British possessions. The pop. of Multan in 1881 was 68,674.

MULTIPLE-POINDING is a well-known form of action in Scotland, by which competing claims to one and the same fund are set at rest. It means double poinding or double distress, suggesting that a person who has funds in his possession is liable to be

harassed by double distress; and hence he commences a suit called the action of multiple-poinding, by which he alleges that he ought not to be made to pay the sum more than once; and as he does not know who is really entitled to payment, he cites all the parties claiming it, so that they may fight out their claims among themselves. The suit corresponds to what is known in England as a bill or order of interpleader.

MULTIPLICA'TION, the third and most important of the four principal processes of arithmetic, is a compendious mode of addition, when a number is to added to itself a given number of times. The three terms of a multiplication are the *multiplicand*, or number to be multiplied; the *multiplier*, or number by which it is to be multiplied; and the *product*, giving the amount which would be obtained if the multiplicand were added to itself the number of times denoted by the multiplier. The symbol of multiplication is $\times$; and in arithmetic the numbers are placed above each other as in addition, with a line drawn under them; in algebra the quantities are merely placed side by side, with or without a dot between them—e.g., the multiplication of 2 by 4 may be written 2×4, and of a by b, $a \times b$, $a.b$, or ab. For multiplication of fractions, see FRACTIONS.

The operation of multiplication has been much abbreviated by the use of logarithms (q.v.), and has been rendered a mere mechanical process, by the invention of Napier's bones, the sliding rule, Gunter's scale, etc.

MULTIVALVE SHELLS, or MULTIVALVES, are those shelly coverings of mollusks which are formed of more than two distinct pieces. In systems of conchology (q.v.) the term is one of primary importance; but since the study of the living animals has led to arrangements very different from those founded on their mere shells, a very subordinate place has been assigned to it, as indicating a distinction much less important than was at first supposed. Thus chitons (q.v.), which have multivalve shells, are now placed in the same order of gasteropods with limpets (q.v.) of which the shells are univalve; and *pholas* (q.v.) and *teredo* (q.v.), which have two principal valves and some small accessory valves, the latter also a long shelly tube, are placed among lamellibranchiate mollusks, along with most of the bivalves of conchologists. In conchological systems, barnacles and acorn-shells were also generally included, and ranked among multivalves; but these are now no longer referred even to the same division of the animal kingdom. See CIRRHOPODA.

MULTNOMAH, a co. in n.w. Oregon; drained by the Willamette and Columbia rivers, the latter being its n. boundary; traversed by the Oregon Central and Oregon and California railroads; about 400 sq.m.; pop. '80, 25,201—17,269 of American birth. The surface is nearly level and is covered by forests, lumber being the chief product. Co. seat, Portland.

MUL'TURES, in Scotch law, mean a quantity of grain either manufactured or in kind deliverable to the proprietor or tacksman of a mill for grinding the corn sent there. Some persons living in the neighborhood are bound to send their corn to be ground at a particular mill, in which case the lands are said to be astricted to the mill, and form the thirl or suken, and the tenants or proprietors of the lands are called insucken multurers. Those who are not bound to go to the mill are called outsucken multurers. Thirlage is thus classed among servitudes, being a kind of burden on the lands. Such a right is unknown in England, except sometimes in old manors.

MUM, a peculiar kind of beer, formerly used in this country, and still used in Germany, especially in Brunswick, where it may be almost regarded as the national drink. Instead of only malt being used, it is made of malt and wheat, to which some brewers add oats and bean-meal. It is neither so wholesome nor so agreeable as the common ale or beer.

MUMMIUS, LUCIUS, about B.C. 185–130; a Roman of plebeian birth; first spoken of as a prætor in the province of farther Spain, where he met with some, but not very great military success. In 146 he was elected consul and placed in command of the Achæan war. The first battle was decisive. It was fought near Corinth and resulted in the complete defeat of the Grecian allies. The surname of Achaiacus was given to Mummius, and a triumph was decreed a second time. The cities of Corinth, Thebes, and Chalcis were plundered and then destroyed by the Roman troops. As trophies of his victory, Mummius caused many of the most valuable works of art to be sent to Rome; and it is related of him, as illustrating his dense ignorance in everything not pertaining to military matters, that he insisted that, if those who were to convey the pictures and statues should break or lose any, they should *replace them by new ones*. Cicero speaks of him as a blunt and plain but honest man, and says that, of all his enormous plunder, none was reserved for his own use. In 141 he was again elected consul, and it was then that the capitol was gilded for the first time. Nothing is known certainly about his later life and his death, some writers saying that he died in exile at Delos, and others that his death occurred in Rome, and that his daughter received a dowry from the senate.

MUMMY. See EMBALMING.

MUMMY-WHEAT is said to be a variety of wheat produced from grains found in an Egyptian mummy. But no good evidence of this origin has been adduced—in fact it is as good as proved to be impossible; and the same variety has long been in general cultivation in Egypt and neighboring countries. The spike is compound—a distinguishing

character, by which it is readily known, but which is not altogether permanent. It is occasionally cultivated in Britain, but seems more suitable to warmer regions.

MUMPS, The, is a popular name of a specific inflammation of the salivary glands described by nosologists as *cynanche parotidæaor* or *parotitis*. In Scotland it is frequentiy termed *the branks*.

The disorder usually begins with a feeling of stiffness about the jaws, which is followed by pains, heat, and swelling beneath the ear. The swelling begins in the parotid, but the other salivary glands (q.v.) usually soon become implicated, so that the swelling extends along the neck toward the chin, thus giving the patient a deformed and somewhat grotesque appearance. One or both sides may be affected, and, in general, the disease appears first on one side and then on the other. There is seldom much fever. The inflammation is usually at its highest point in three or four days, after which it begins to decline, suppuration of the glands scarcely ever occurring. In most cases no treatment further than antiphlogistic regimen, due attention to the bowels, and protection of the parts from cold, by the application of flannel or cotton-wool, is required, and the patient completely recovers in eight or ten days.

The disease often originates from epidemic or endemic influences, but there can be no doubt that it spreads by contagion; and, like most contagious diseases, it seldom affects the same person twice. It chiefly attacks children and young persons.

A singular circumstance connected with the disease is, that in many cases the subsidence of the swelling is immediately followed by swelling and pain in the *testes* in the male sex, and in the *mammæ* in the female. The inflammation in these glands is seldom very painful or long continued, but occasionally the inflammation is transferred from these organs to the brain, when a comparatively trifling disorder is converted into a most perilous disease.

MÜNCHHAUSEN, Karl Friedrich Hieronymus, Baron von, a member of an ancient and noble German family, who attained a remarkable celebrity by false and ridiculously exaggerated tales of his exploits and adventures so that his name has become proverbial. He was b. in 1720 at the family estate of Bodenwerder, in Hanover, served as a cavalry officer in the Russian campaigns against the Turks in 1737–39, and died in 1797. A collection of his marvelous stories was first published in England under the title of *Baron Münchhausen's Narrative of his Marvelous Travels and Campaigns in Russia* (Lond. 1785). The compiler was one Rudolf Erich Raspe, an expatriated countryman of the baron's. A second edition appeared at Oxford (1786) under the title of *The Singular Travels, Campaigns, Voyages, and Sporting Adventures of Baron Munnikhousen, commonly pronounced Munchausen; as he relates them over a bottle when surrounded by his friends.* Several other editions rapidly followed. In the same year (1786) appeared the first German edition, edited by the poet Bürger; the latest—entitled *Des Freiherrn von Münchhausen wunderbares Reisen und Abenteuer* (1849 and 1855)—is enriched by an admirable introduction by Adolf Ellisen, on the origin and sources of the famousbook, and on the kind of literary fiction to which it belongs. Ellisen's father knew the splendid old braggart in his latter days, and used to visit him. Nevertheless, although Raspe may have derived many of his narratives from Münchhausen himself, he appears to have drawn pretty largely from other sources. Several of the adventures ascribed to the baron are to be found in older books, particularly in Bebel's *Facetiæ* (Strasb. 1508); others in Castiglione's *Cortegiano*, and Bildermann's *Utopia*, which are included in Lange's *Deliciæ Academicæ* (Heilbronn, 1765). Münchhausen's stories still retain their popularity, especially with the young.

MUNCH, Andreas, b. Norway, 1810; studied jurisprudence at Christiania, in the library of whose university he was employed as an amanuensis from 1830 to 1860. He published *Poems, Old and New*, in 1848, and *New Poems* in 1850. His dramas, *Salomon de Caus*, 1845, and *Lord William Russell*, 1857, were well received. He was pensioned by the government in 1860. He d. 1884.

MUNCH, Peder Andreas, 1810–63; b. Norway, educated at Skien and at the university of Christiania, where he took a degree in jurisprudence. Preferring the study of languages and history to law, he became professor of history at Christiania. In 186[illegible] he was appointed historiographer and archivist of Norway. His favorite studies were the ancient history and languages of Scandinavia, on which he propounded some novel theories. He maintained that three distinct dialects prevailed in the kingdoms of Norway, Sweden, and Denmark, and that the so-called Icelandic literature was really the production of ancient Norway. He held that the modern Icelanders keep one dialect and the inhabitants of the Färoe islands another of the ancient Norwegian. He rejected the term "Icelandic," for which he substituted "old Norwegian." He was a bitter opponent of "Scandinavism," or the union of Norway, Sweden, and Denmark in one kingdom. He published an *Old Norwegian Grammar*, an *Old Norwegian Reading Book*, and a *History of Norway, Sweden, and Denmark*, and edited a number of Icelandic works, including the elder *Edda* and the *Royal Mirror*.

MÜNCH-BELLINGHAUSEN, Eligius Franz Joseph von, Baron, 1806–71; b. Cracow; studied jurisprudence, and held a number of government offices in Austria. His first play, *Griseldis*, was produced at the Burg theater in Vienna, of which he was afterward director, in 1834, and was well received. It was followed by *The Adept*, 1836;

Camoens, 1837; *Imelda Lamberdazzi*, 1838; and the *Son of the Wilderness*, 1843, well known on the American stage under the name of *Ingomar*. *Maria de Molina* appeared in 1847, and *The Gladiator from Ravenna*, his greatest work, in 1854. He published also a vol ume of verses. He wrote under the pseudonym of "Friedrich Halm."

MÜNCHEN-GLADBACK, a t. in Rhenish Prussia, 16 m. by rail, w. by s. of Düsseldorf. It has large manufactures of linen and damask cloths. Pop. 31,970.

MUNDT, Klara (Müller,) 1814–73; her father, aulic councilor of Neubrandenburg, gave her an excellent education which rapidly developed the powers of her mind and turned her attention to the study of serious subjects. She was married in 1839 to the radical writer Theodor Mundt, whose advanced opinions in regard to the emancipation of women, etc., she adopted. She began her literary career under the pseudonym of Louise Mühlbach, and published a large number of romances abounding in startling situations, in which poison and the stiletto play a principal part. She is best known by her historical novels, which have all been translated into English, and are distinguished rather for their brilliancy than for their accuracy. Among them are *Joseph II. and his Court; Frederick the Great and his family; Marie Antoinette and her son; Queen Hortense; Goethe and Schiller;* and *Napoleon and Blucher.*

MUNCIE, co. seat of Delaware co., Ind.; on the w. fork of the White river, at the junction of the Cleveland, Columbus, Cincinnati, and Indianapolis, and the Fort Wayne, Muncie, and Cincinnati railroads; 54 m. n.e. of Indianapolis by rail; pop. 5,219. It has a good local business. The town has 9 churches, a court house, a city hall, banks, newspapers, good schools, a public library, and two or three foundries and factories.

MUNDT Theodor, 1808–61; b. Germany; educated at the universities of Berlin and Leipsic. He took an active interest in public affairs, and identified himself with that party of rising authors, journalists, and politicians, known as "Young Germany." His political views brought him into disfavor with the government, and he left Germany, and made a European tour. On his return he was permitted to become a member of the teaching body of the university of Berlin, and in 1848, he was appointed to the chair of history at Breslau. Two years later he was made director of the Berlin university library. The first of his works to attract attention, was *Madonna, or Conversations with a Saint*, a powerful but unwholesome book, which is said to have induced Charlotte Stieglitz to kill herself out of affection for her husband. Her works were collected and published by Mundt in 1835. After the publication of a number of books of travel, he wrote a series of historical or romantic novels, of which the most successful were: *Carmola, or the Anabaptists*, 1844; *Mendoza, or the Arch-scoundrel*, 1847; and *The Matadores*, 1850. He edited in conjunction with Varnhagen von Ense, the posthumous works of Knebel, and prepared an edition of the political writings of Luther. He also wrote a *History of Society*, *History of Contemporary Literature*, and a universal literary *History*. He married the novelist, Klara Muller.

MUN'DANE EGG. In many heathen cosmogonies, the world (Lat. *mundus*) is represented as evolved from an egg. The production of a young animal from what neither resembles it in form nor in properties, seems to have been regarded as affording a good figure of the production of a well-ordered world out of chaos. Thus, in the Egyptian, Hindu, and Japanese systems, the Creator is represented as producing an egg, from which the world was produced. The same notion is found, in variously modified forms, in the religions of many of the ruder heathen nations. Sometimes a bird is represented as depositing the egg on the primordial waters. There are other modifications of this notion or belief in the classical and other mythologies, according to which the inhabitants of the world, or some of the gods, or the powers of good and evil, are represented as produced from eggs. The egg appears also in some mythological systems as the symbol of reproduction or renovation, as well as of creation. The Mundane Egg belonged to the ancient Phœnician system, and an egg is said to have been an object of worship.

MUNFORDVILLE : magisterial dist. No. 1, Hart Co., Ky. Pop. '80, 4,226.

MUNGER, Theodore Thornton, d.d. See page 886.

MUNGO, Saint, the popular name of St. Kentigern, one of the three great missionaries of the Christian faith in Scotland. St. Ninian (q.v.) converted the tribes of the s.; St. Columba (q.v.) was the apostle of the w. and the n.; St. Kentigern restored or established the religion of the Welsh or British people, who held the country between the Clyde on the n., and the furthest boundaries of Cumberland on the s. (see Bretts and Scots). He is said to have been the son of a British prince, Owen ab Urien Rheged, and of a British princess, Dwynwen or Thenaw, the daughter of Llewddyn Lueddog of Dinas Eiddyn, or Edinburgh. He was born about the year 514, it is believed at Culross, on the Forth, the site of a monastery then ruled by St. Serf, of whom St. Kentigern became the favorite disciple. It is said, indeed, that he was so generally beloved by the monastic brethren, that his baptismal name of Kentigern or Cyndeyrn, signifying "chief lord," was exchanged in common speech for Mungo, signifying "loveable" or "dear friend." Leaving Culross, he planted a monastery at a place then called Cathures, now known as Glasgow, and became the bishop of the kingdom of Cumbria (q.v.). The nation would seem to have been only partially converted, and the accession of a new king drove St. Kentigern from the realm. He found refuge among the kindred people of Wales, and there, upon the banks of another Clyde, he founded another monastery and bishopric, which still bears the name of his disciple, St. Asaph. Recalled to Glasgow by a new

king, Rydderech or Roderick the bountiful, Kentigern renewed his missionary labors, in which he was cheered by a visit from St. Columba, and dying about the year 601, was buried where the cathedral of Glasgow now stands. His life has been often written. A fragment of a memoir, composed at the desire of Herbert, bishop of Glasgow, between 1147 and 1164, has been printed by Mr. Cosmo Innes in the *Registrum Episcopatus Glasguensis*. The longer life by Joceline of Furness, written about 1180, was published by Pinkerton in his *Vitæ Antiquæ Sanctorum Scotiæ*. It appeals to two still older lives. The fame of St. Kentigern is attested by the many churches which still bear his name, as well in Scotland as in the n. of England. The church of Crosthwaite, where Southey is buried, is dedicated to him. The miracles which he was believed to have wrought were so deeply rooted in the popular mind, that some of them sprung up again in the 18th c. to grace the legends of the Cameronian martyrs. Others are still commemorated by the armorial ensigns of the city of Glasgow—a hazel-tree whose frozen branches he kindled into a flame, a tame robin which he restored to life, a hand-bell which he brought from Rome, a salmon which rescued from the depths of the Clyde the lost ring of the frail queen of Cadyow. Nor is it St. Mungo only whose memory survives at Glasgow; the parish church of "St. Enoch" commemorates his mother, St. Thenaw; and it is not many years since a neighboring spring, which still bears her name, ceased to be an object of occasional pilgrimage.

MUNI, a Sanskrit title, denoting a holy sage, and applied to a great number of distinguished personages, supposed to have acquired, by dint of austerities, more or less divine faculties.

MUNICH (Ger. *München*), the capital of Bavaria, is situated in 48° 8′ n. lat., and 11° 35′ e. long., in the midst of a barren and flat elevated plain, at a height of about 1700 ft. above the level of the sea. Pop. '81, 230,023, about 90 per cent. being Roman Catholics, 9 per cent. Protestants, and 1 per cent Jews; '75, 193,024. Munich lies on the left bank of the Iser, and consists, in addition to the old town, of five surburbs, and of the three contiguous districts of Au, Haidhausen, and Obergiesing. By the efforts of king Ludwig I., who spent nearly 7,000,000 thalers on the improvements of the city, Munich has been decorated with buildings of almost every style of architecture, and enriched with a larger and more valuable collection of art-treasures than any other city of Germany. It possesses 42 churches, of which all but two or three are Catholic, and of these, the most worthy of note are: the cathedral, which is the see for the archbishopric of Munich-Freising, built between 1468–94, and remarkable for its two square towers, with their octagonal upper stories, capped by cupolas, and its 30 lofty and highly-decorated windows; the church of the Jesuits, or St. Michael's, which contains a monument by Thorwaldsen to Eugene Beauharnais; the Theatiner Kirche, completed in 1767, and containing the burying-vaults of the royal family; the beautiful modern church of St. Mariahilf, with its gorgeous painted glass and exquisite wood-carvings; the round church, or Basilica of St. Boniface, with its dome resting on 64 monoliths of grey Tyrolean marble, and resplendent with gold, frescoes, and noble works of art; the cruciform-shaped Ludwig Kirche, embellished with Cornelius's fresco of the Last Judgment; and lastly, the Court Chapel of All Saints, a perfect casket of art-treasures. Among the other numerous public buildings, a description of which would fill a volume, we can only briefly refer to a few of the more notable; as the theater, the largest in Germany, and capable of accommodating 2,400 spectators; the post-office; the Ruhmes-halle; the new palace, including the older royal residence, the treasury and chapel, antiquarian collections, etc.; and the Königsbau, designed by Klenze in imitation of the Pitti palace, and built at a cost of 1,250,000 thalers, containing J. Schnorr's frescoes of the Nibelungen; the banqueting halls, rich in sculpture by Schwanthaler, and in grand fresco and other paintings. In the still incomplete suburb of Maximilian are situated the old Pinakothek, or picture-gallery, erected in 1836 by Klenze, containing 300,000 engravings, 9,000 drawings, a collection of Etruscan remains, etc.; and immediately opposite to it, the new Pinakothek, completed in 1853, and devoted to the works of recent artists; the Glyptothek, with its 12 galleries of ancient sculpture, and its noble collection of the works of the great modern sculptors, as Canova, Thorwaldsen, Schadow, etc. Among the gates of Munich, the most beautiful are the Siegesthor ("The Gate of Victory"), designed after Constantine's triumphal arch in the Forum, and the Isarthor with its elaborate frescoes. In addition to these and many other buildings intended either solely for the adornment of the city, or to serve as depositories for works of art, Munich possesses numerous scientific, literary, and benevolent institutions, alike remarkable for the architectural and artistic beauty of their external appearance, and the liberal spirit which characterizes their internal organization. The library, which is enriched by the biblical treasures of numerous suppressed monasteries, contains about 800,000 volumes, of which 1300 are incunabula, with nearly 22,000 MSS. The university, with which that of Landshut was incorporated in 1826, and now known as the Ludwig-Maximilian university, comprises 5 faculties, with a staff of 116 professors and teachers. In 1876 the number of matriculated students attending the university was 1203. In association with it are numerous medical and other schools, a library containing 200,000 volumes, and various museums and cabinets. The well known *Allgemeine Zeitung* is now published here.

Munich has an ably-conducted observatory, supplied with first-rate instruments by

Fraunhofer and Reichenbach; 3 gymnasia, 4 Latin, 1 normal, various military, professional, polytechnic, and parish schools, of which the majority are Catholic; institutions for the blind, deaf and dumb, and crippled, and for female orphans, besides numerous hospitals, asylums, infant schools, etc.; an academy of sciences; royal academies of painting, sculpture, music, etc.; a botanic garden, parks, public walks, and gardens adorned with historic, patriotic, and other monuments, and designed for the celebration of annual and other national fairs and festivals; spacious cemeteries, etc. Munich is mainly indebted to Ludwig I. for its celebrity as a seat of the fine arts, as the greater number of the buildings for which it is now famed were erected between 1820 and 1850, although, under his successors, Maximilian II., and Ludwig II. (ascended the throne in 1864), the progress of the embellishments of the city has been continued on an equally liberal scale. Munich is somewhat behind many lesser towns of Germany in regard to literary advancement and freedom of speculation, while its industrial activity is also inferior to its state of high artistic development. It has, however, some eminently good iron, bronze, and bell foundries, and is famed for its lithographers and engravers, and its optical, mathematical, and mechanical instrument-makers, amongst whom Utzschneider, Fraunhofer, and Ertl have acquired a world-wide renown. Munich is noted for its enormous breweries of *Bavarian beer;* and has some good manufactories for cotton, wool, and damask goods, wax-cloth, leather, paper-hangings, carriages, pianos, gold, silver, and steel wares, etc.

The present name of this city cannot be traced further than the 12th c., when Henry the lion raised the *Ville Munichen* from its previous obscurity by establishing a mint within its precincts, and making it the chief emporium for the salt which was obtained from Halle and the neighboring districts. In the 13th c. the dukes of the Wittelsbach dynasty selected Munich for their residence, built the Ludwigsburg, some parts of whose original structure still exist, and surrounded the town with walls and other fortified defenses. In 1327 the old town was nearly destroyed by fire, and rebuilt by the emperor Ludwig of Bavaria, very much on the plan which it still exhibits; but it was not till the close of last century, when the fortifications were razed to the ground, that the limits of the town were enlarged to any extent. The last fifty years, indeed, comprise the true history of Munich, since within that period all its finest buildings have been erected, its character as a focus of artistic activity has been developed, its population has been more than doubled, and its material prosperity augmented in a proportionate degree.

MUNICIPAL ARCHITECTURE, the style of the buildings used for municipal purposes, such as town-halls, guild-halls, etc. These were first used when the towns of the middle ages rose in importance, and asserted their freedom. Those of north Italy and Belgium were the first to move, and consequently we find in these countries the earliest and most important specimens of municipal architecture during the middle ages. It is only in the "free cities" of that epoch that town-halls are found. We therefore look for them in vain in France or England till the development of industry and knowledge had made the citizens of the large towns so wealthy and important as to enable them to raise the municipal power into an institution. When this became the case, in the 15th and 16th centuries, we find in these countries abundant instances of buildings erected for the use of the guilds and corporations and the municipal courts. Many of these still exist along with the corporate bodies they belong to, especially in London, where the halls are frequently of great magnificence. Many of these corporation halls have recently been rebuilt by the wealthy bodies they belong to, such as the fish-mongers, merchant tailors, goldsmiths, and other companies. Municipal buildings on a large scale for the use of the town councils and magistrates have also been recently erected in many of our large towns, which had quite out-grown their original modest buildings; and now no town of importance is complete without a great town-hall for the use of the inhabitants.

Municipal buildings always partake of the character of the architecture of the period when they are erected; thus we find in Italy that they are in the Italian-Gothic style in Como, Padua, Vicenza, Venice, Florence, etc., during the 13th, 14th, and 15th centuries. In Belgium, during the same period, they are of the northern Gothic style, and are almost the only really fine specimens of the civil architecture of the middle ages we possess. The cloth-hall at Ypres, and the town-halls of Brussels, Louvain, Bruges, Oudenarde, etc., the exchange at Antwerp, and many other markets, lodges, halls, etc., testify to the early importance of the municipal institutions in Belgium.

It is a curious fact that in France, where the towns became of considerable importance during the middle ages, so few municipal buildings remain. This arises from the circumstance that the resources of the early municipalities of France were devoted to aid the bishops in the erection of the great French cathedrals, and the townspeople used these cathedrals as their halls of assembly, and even for such purposes as masques and amusement.

Of the English corporation halls, those which remain are nearly all subsequent to the 14th c., from which time to the present there are very many examples. The guild-hall of London is one of the earliest. The present building was begun in 1411, and was built chiefly by contributions from the trades "companies" of London. Of the town-halls recently erected, those of Manchester, Liverpool, and Leeds are amongst the most important.

MUNICIPALITY, MUNICIPAL CORPORATION (from Lat. *municeps*, from *munus* and *capio*, one who enjoys the rights of a free citizen), a town or city possessed of certain privileges of local self-government; the governing body in such a town. Municipal institutions originated in the times of the Roman empire. The provincial towns of Italy, which were from the first Roman colonies, as also those which, after having an independent existence, became members of the Roman state, though subjected to the rule of an imperial governor, were allowed to enjoy the right of regulating their internal affairs. A class of the inhabitants called the *curia*, or *decuriones*, elected two officers called *duumviri*, whose functions were supposed to be analogous to those of the consuls of the imperial city, and who exercised a limited jurisdiction, civil and criminal. There was an important functionary in every municipality called the *defensor civitatis*, or advocate for the city, the protector of the citizens against arbitrary acts on the part of the imperial governor. In the later ages of the empire, the decuriones were subject to heavy burdens; not compensated by the honor of the position, which led many to endeavor to shun the office. The municipal system declined with the decline of the empire, yet it retained vitality enough to be afterwards resuscitated in union with feudalism, and with the Saxon institutions of Britain. Some cities of Italy, France, and Germany have indeed derived their present magistracy by direct succession from the days of imperial Rome, as is notably the case with Cologne. The bishop, being a shield between the conquerors and the conquered, in many cases discharged the duties or obtained the functions of the *defensor civitatis*. To the north of the Alps, under the feudal system, he became officially the civil governor of the city, as the count was of the rural district. In southern Europe, where feudalism was less vigorous, the municipalities retained a large share of freedom and self-government.

Of the cities of the middle ages, some were entirely free; they had, like the provincial towns of Italy before the extension of the Roman conquests, a constitution independent of any other powers. Venice, Genoa, Florence, Hamburg, and Lübeck all stood in this position. Next in dignity were the free imperial cities in Germany, which, not being comprehended in the dominions of any of the princes, were in immediate dependence on the empire. Most of these cities rose into importance in the 13th c.; and their liberties and privileges were fostered by the Franconian emperors, to afford some counterpoise to the growing power of the immediate nobility. Nuremberg was especially celebrated for its stout resistance to the house of Brandenburg, and the successful war which it waged with the Franconian nobility. In England the more important cities were immediate vassals of the crown; the smaller municipalities sometimes owned a subject superior, sometimes a greater municipality for their overlord.

Under the Anglo-Saxons, the English burghs were subject to the rule of an elective officer called the "portreve," who exercised in the burgh functions similar to those of the shire-reve in the shire. The Norman conquerors recognized the already existing privileges of the towns by granting them charters. Instead of a shire-reve, a viscount was placed by the king over each shire, and a bailiff instead of the former elective officer over each burgh. In the larger towns, the bailiff was allowed to assume the Norman appellation of mayor. The municipal franchise seems to have been vested in all the resident and trading inhabitants, who shared in the payment of the local taxes, and performance of local duties. Titles to freedom were also recognized on the grounds of birth, apprenticeship, marriage, and sometimes free gift.

In all the larger towns, the trading population came to be divided into guilds or trading companies, through membership of which companies admission was obtained to the franchise. Eventually the whole community was enrolled in one or other of the guilds, each of which had its property, its by-laws, and its common hall, and the community elected the chief officers. It was on the wealthier and more influential inhabitants that municipal offices were generally conferred; and the practice gradually gained ground of these functionaries perpetuating their authority without appealing to the popular suffrage. Contentions and disputes arose regarding the right of election, and eventually the crown threw the weight of its influence into the scale of self-elective ruling bodies. As the greater municipalities grew in strength, we find their right recognized to appear in parliament by means of representatives. The sheriffs were considered to have a discretionary power to determine which towns should, and which should not have this privilege of representation. The sovereigns of the house of Tudor and Stuart acquired the habit of extending the right of parliamentary representation to burghs not in the enjoyment of it, while at the same time, by granting or renewing to them municipal charters, they modeled the constitution of these burghs to a self-elective type, and restricted the right of voting in the choice of a representative to the governing body. During the reign of William III., Anne, and the earlier Georges, the influence of the crown was largely employed in calling new municipal corporations into existence, with the view of creating additional parliamentary support for the ministry in power. The burghs of Scotland had a history much like that of the burghs of England; their earlier charters were mere recognitions of already existing rights, and were granted to the inhabitants at large. In the course of the 14th and 15th centuries, the municipal suffrage fell gradually more and more into the hands of restricted bodies of men, until act 1469, c. 5, gave to the councils the right of appointing their successors, the old and new council together electing the office-bearers of the corporation. This state of things con-

tinued till 1833, not without much complaint. In the Scottish burghs, the several trades possessed a much more exclusive monopoly than in England. Along with the outcry for parliamentary reform arose an outcry for municipal reform; and a separate municipal reform act putting an end to the close system was passed for each part of the empire. The English act (5 and 6 William IV. c. 76), entitled "An act to provide for the regulation of municipal corporations in England," conferred the franchise on the owners and occupiers of property within the burgh, with certain qualifications as to property, residence, etc. This constituency elected the councilors, and from the body of the councilors the mayor and aldermen were chosen. Act 32 and 33 Vict. c. 55, limited the requisite period of residence to one year's occupation, and the ballot was introduced by 35 and 36 Vict. c. 33, in municipal as in parliamentary elections. Act 3 and 4 William IV. made an entire change in the mode of electing councils in Scottish burghs which already had a council, and conferred counеils on burghs which had none. A vote was given to every one who had resided six months in the burgh, or within seven of miles of it, and possessed the requisite qualification to exercise the parliamentary franchise: a property qualification similar to what conferred the parliamentary franchise being required in burghs that did not send or contribute to send a member to parliament. The municipal elections amendment act (Scotland) 1868, has placed the municipal franchise in the hands of all registered voters to return a member of parliament, and in the case of burghs not represented in parliament, in the hands of all persons possessing similar property qualifications: and act 33 and 34 Vict. c. 92 has provided for the establishment of a municipal register in burghs not represented in parliament. An exemption, under 3 and 4 William IV. c. 76, of nine small burghs from the operation of the new system has been done away with. Town-councilors must be electors residing in or carrying on business in the burgh. They remain in office three years, and elect from their number the provost and bailies. The English act of William IV. abolished the exclusive privileges of the guilds, but these monopolies continued in Scotland till 1839, when they were swept away by 9 and 10 Vict. c. 17. The Irish municipal system, which had been imported ready-made from England, was assimilated to the altered English system by 3 and 4 Vict. c. 108.

MUNICIPALITY—Municipal Corporation (*ante*), for the management of the affairs of a town or city. Municipal corporations, in the United States, are public corporations established by law for political purposes, and chiefly to exercise local and subordinate powers of legislation for the town or district incorporated. The corporation is not the body of the people, nor is it the officers collectively considered, but rather that legal entity created by the act of incorporation and limited thereby. Distinction must be made between a municipal corporation proper and what are known as *quasi* corporations not created by the motion of the people of the district, but rather as territorial or political divisions of the state, such as counties, and the peculiar New England townships, which are examples of almost pure democracy. The laws regulating the incorporation of English towns and cities have little application to municipal corporations in this country. Here none are founded on common law or royal charter, and but few are based upon prescription. It may be said that they exist only by legislative enactment, and possess no powers not created by the statute. The majority of municipal corporations are created by charter singly, but *general laws* of incorporation have been passed in many states, as Ohio, Iowa, Pennsylvania, Indiana, Missouri, Tennessee, and North Carolina. When the incorporation is single or special, the charter sets out that the inhabitants are constituted a body politic with such a name and style; that by that name they may have perpetual succession, and may use a common seal, sue and be sued, etc. The territorial boundaries are defined and provision made as to the form of government—usually by a council made up of aldermen and councilmen, or by trustees—as to division into wards, qualifications of voters, powers of city council to collect debts and lay taxes, etc. General laws of municipal incorporation as in the states above mentioned, usually start by abolishing all special charters existing, and establish general regulations for the incorporation, government, and regulation of municipal corporations throughout the state. Frequently such laws classify the towns to be incorporated as regards their importance into cities of first or second grade, towns, and villages. To become operative the charter granted by the legislature must be accepted by the body of citizens to be incorporated. Provisions sometimes exist in the constitutions of the states limiting the power of the legislature in granting powers and privileges to towns and cities.

When established, the municipal corporation is not beyond the power of the legislature; thus it has been held that the latter may repeal charter provisions, allowing the licensing of liquor dealers, and even such as relate to police regulations. In other words, the town has no *vested right* in its charter privileges, and they may always be altered or revoked with the important exception that the rights of existing and constitutional creditors must not be disregarded. In the celebrated Dartmouth college case it was strongly intimated from the bench that the legislature could not revoke a grant to municipal corporations in *fee simple*. But the legislature has general control over public property, and may authorize a railroad to occupy the streets of a city, without payment therefor. No exact form of words is necessary to give force to the charter, and the cor-

porations may even be created by implication. The charter may be amended or repealed by either general or special law. The powers given to the municipality are those expressly stated in the charter, such as may fairly be implied therefrom, and such as are essential to the carrying out of the purpose for which the body is created. Where the city is given a discretion upon any point it is not for the courts to say whether such discretion has or has not been wisely used. Thus, if it have power to open new streets or grade old ones when necessary for the welfare of the city, the question of necessity is one for the determination of its own governing body. It has been fully decided that taxes and public funds cannot be seized under execution or by writ of garnishment. *Salus populi suprema lex.*

Among the leading powers of a municipal corporation are the rights of taxation, of eminent domain, appointing officers, enacting ordinances, and instituting actions. Many special powers are given as to borrowing money, police regulations, wharves, ferries, giving aid to railroads, entertaining guests, etc. That in all these and other powers the corporation may act freely when there is special enactment in the charter or general law is not a matter of doubt. But how far may they extend their operations without such authority and under a general clause empowering them to act for the *general welfare* of the city? The power to become indebted is often specially limited. The doctrine that cities may aid railroads by the purchase of bonds or otherwise was established by the U. S. supreme court in *Olcott* vs. *Supervisors* (1873), on the ground that railroads are *publici juris*. The power to borrow money is implied when necessary to the ends for which the corporation exists. It seems to be the doctrine that the corporate existence can cease only by act of legislature, that is, that the municipality cannot voluntarily surrender its privileges. *Amotion* is the removal of an agent or officer of a corporation before his term is expired, and must be for cause, which, however, may be for other than official dereliction, as for infamous private character. The city government may regulate local elections so as to preserve purity of the ballot without special authority; special tribunals to decide contests are often established by the charter, and courts of law may inquire into the proceedings by writs of *quo warranto* or *mandamus*, unless the legislature has denied such right. As to legal liability, an officer improperly removed may bring suit for damages against the corporations; but the city or town cannot have an action against an officer or agent for damage resulting from an honest mistake on his part.

Corporate meetings are usually provided for by charter, but may be regulated by ordinance. In the peculiar New England township system the meeting is actually an assembly of the whole body of inhabitants; though even there in large cities these meetings are necessarily mere formalities; and in many places true municipal corporations have control over the same territory. Elsewhere the representative system prevails. Notice of time and place of meeting should be given, and it is customary to state the nature of matters to be discussed. Ordinances may be declared void by the legislature if oppressive or in restraint (not regulation) of trade. Of course, if power to enact law is given, power to punish is implied, usually by fine; and it has been held that there is no power of imprisonment except by statutory provision; yet the power of appeal from a municipal to a higher court has been held to satisfy the constitutional right of the citizen to a trial before a jury. Strangers are bound by local ordinances.

The powers of the municipality under a "general welfare" clause are to be interpreted very liberally when the health, peace, or safety of a city are at stake. Contracts may be entered into under the express or implied authority of the statute. Parties contracting with a public corporation are bound to find out the true powers of the latter, and the scope of an agent's authority; but an unathorized contract may be accepted by ratification. Payment is usually by warrant on the treasurer, and if, after being cashed by the latter, the warrant is again put on the market, even though by a regular officer of the city, it is worthless, though in the hands of an innocent third party. Municipal corporations have large powers as to acquiring and disposing of property; conveyance must be under corporate name and seal, a vote in council not passing title. As to the right of eminent domain, most important questions have arisen, and the lines of power are not yet clearly drawn. The constitution of the United States provides that private property shall not be taken for public use except upon just compensation, but manifestly the raising of taxes and the destruction of property under necessary police powers do not come under this head. The rule is that the purpose for which property is taken must be useful, as in water-works, sewers, etc., and not merely ornamental. But public parks have been held necessary to the health and well-being of a city, and the right of eminent domain has been allowed. Proper notice must be given. Unjust assessment of damages may be brought before a court by writ of *certiorari*. The damages are usually assessed by commissioners; in New York by "a jury, or not less than three commissioners appointed by a court of record." It has been held that the power of legislatures to place railroads in public streets may be delegated to municipal authorities. In assessment for street improvements it is very common to equalize the benefits and damages done to property holders, paying compensation to some and assessing others. The privileges both as to eminent domain and taxation which have been granted by legislature to large cities have been dangerously great, and nowhere more so than in the city of New York. In such cities the interests involved are so immense and the danger of corruption so great, that there is a growing desire to restrain the power

of the legislature by constitutional provisions. Officers and agents of the municipal corporation may be proceeded against under writs of *mandamus* if they neglect their duties, or *quo warranto* if they exceed or usurp powers. As to torts, the corporation is not liable when it uses its discretionary powers in good faith, or if it fail to secure perfect execution of its by-laws, or for damage by riotous mobs. But where there has been absolute malfeasance or neglect to perform duties, a suit lies, even though liability is not specified in the charter. Municipal corporations are not insurers against accident, but are liable for neglect, as in defective and unsafe streets, yet it has been held that in New England towns there exists no such liability, unless there be special enactment. Where a private individual was injured by the negligence of a contractor employed by the corporation, the latter was held liable. But it is supposed that either notice of the defect or danger must be given to the city, or else the circumstances must be such as to imply knowledge of the facts by the party concerned.

MU'NIMENT-HOUSE, a strong fire-proof apartment or building suited to contain archives, papers, and other valuables.

MUN'JEET (*Rubia cordifolia* or *munjista*), a species of madder (q.v.), of which the root yields an excellent red dye. The plant differs from the common madder in its more distinctly quadrangular stem, its cordate-oblong leaves commonly in fours, and its red berries. It is a native of India, China, Japan, Central Asia, and Siberia. The root has long been used in India as affording a red dye; and is now an article of export to Europe, as a substitute for madder.

MUNK, Salomon, b. 1805, in Glogau, in Silesia, of Jewish parents; studied at Bonn and Heidelberg, and at Paris under Sacy and Chizy; went to Oxford in 1835, in search of the Arabic original of maimonides; and in 1840 was made custodian of the oriental manuscripts in the Bibliothéque de Paris. He accompanied Montefiore and Crémieux to Egypt, bringing back many valuable manuscripts. He gave up his position in the library in 1850 on account of weakness in the eyes. He wrote Arabic and Hebrew critical books from 1833 to 1852, publishing his *Philosophy and Philosophical Works of the Jews*, in German, in 1852. He d. 1867.

MUNKACS', a market t. of Hungary, situated on an affluent of the Theiss, 178 m. n.e. of Pesth. The inhabitants are mostly artizans, and the chief production is hosiery. There are also alum manufacturies, saltpeter-works, and in the vicinity, iron-works and mines of rock-crystal, called Hungarian diamonds. A short distance e. from the town is the fortress (founded in 1359) of Monkacs, built upon an isolated height, which, although small and insignificant-looking, yet, from its strong walls and advantageous position, has for the last few centuries, withstood many a seige. Since the beginning of the present century, it has been used as a state-prison. Pop. '80, 9,644.

*MUNKACSY, Mihaly, b. at Munkacs, Hungary, studied art with Knaus, and was a medalist of the Paris salon of 1870 and 1874. Among his works are the "Story of the Hunt;" the "Mont de Piété;" the "Night Prowlers;" and that by which he is known in the United States, "Milton dictating to his daughters;" which is in the Lenox library, New York. See *Supp.*, page 886.

MUNRO, Alexander, 1827–71, b. England; a sculptor, whose statues of "Hippocrates," "Davy," and "Galileo," are in the Oxford museum. His principal works were the statue of James Watt, at Birmingham, and of queen Mary in Westminster hall. His portraits in bass-relief were fine. All his productions show masterly grace and elegance. He died in France.

MUNROE, Sir Thomas, 1760–1827, b. in Glasgow; emigrated to India when about 20 years old, and became an officer of the army employed by the East India company. By valuable service in many campaigns, he rose to the rank of maj.gen., and in 1819 was appointed governor of the city of Madras, and soon after knighted.

MUNSEES, Minsis, or Monseys, a tribe of North American Indians, who resided on the upper Delaware and Minisink rivers. In 1663 they joined the Esopus tribe in an attack upon a Dutch fort for which act they were punished by gen. Krieger. They laid claim to the territory extending from the Minisink to the Hudson, the head waters of the Delaware and the Susquehanna, and s. to the Lehigh and Conewago. Early in the 18th c., settlers began to encroach upon their lands and drove them back to the Susquehanna. In spite of the efforts of the Moravians to win them, they moved w. through the Iroquois and joined the French at Niagara. Sir William Johnson, with some difficulty, managed to gain them over to the side of the English. After the fall of the French, some of them joined the Moravians, but during the revolutionary war, most of the tribe under capt. Pipes withdrew to Sandusky and fought for the British. Even after the war they remained hostile, and were not reduced to terms until 1805. In 1808 a portion of the tribe settled on Miami land at White river. Later they joined the Stockbridge Indians near Green bay. In 1839 they were removed to Kansas. The tribe is now nearly extinct. Their language was a dialect of the Algonquin and similar to that of the Delawares.

MUNSELL, Joel, b. Mass., 1808; removed to Albany, N. Y. in 1827, and distinguished himself as a printer, journalist, and author. In 1828 he was the editor of the *Albany Minerva*, and *New York State Mechanic*. He published *Annals of Albany*, 10 vols;

Collections on the History of Albany, 4 vols.; *Every-Day Book of History and Chronology; Chronology of Paper and Paper-making.* His collection of works on printing is the largest ever made in America, and part of it has been purchased for the New York state library. He d. 1880.

MUNSON, ÆNEAS, 1734–1826, b. Conn.; educated at Yale, and studied theology. He was chaplain in a colonial regiment during the French war, after which he studied medicine, and began to practice in 1756. He settled at New Haven in 1760, and attained a high rank in his profession there. He was president of the state medical society, and a professor in the Yale medical school from its foundation.

MUNSTER, the largest of the four provinces of Ireland, occupies the s.w., and is bounded on the n. by Connaught, on the e. by Leinster, and on the w. and s. by the Atlantic. It contains the six counties of Clare, Cork, Kerry, Limerick, Tipperary, and Waterford, and the country is described under these heads. Area, 6,064,579 statute acres. The population of the province, which in 1841 was higher than that of any of the other provinces, was shown to be, in 1881, 1,323,910, or 439,743 less than that of Ulster, now the most populous of the provinces.

MUNSTER, chief t. of the district of the same name, as well as capital of all Westphalia, is situated in 51° 55′ n. lat., and 7° 40′ e. long., at the confluence of the Aa with the Münster canal, 65 m. n.e. of Düsseldorf. The pop. in 1871 was 24,815; in 1881, 40,434. Münster, which is a bishopric, and the seat of a military council, a high court of appeal, and other governmental tribunals, is one of the handsomest towns of Westphalia, retaining numerous remains of medieval architecture, whose quaint picturesqueness is enhanced by the numerous trees and shady allées, by which the squares and streets are ornamented. Among its 14 churches, of which the majority are Catholic, the most noteworthy are the cathedral, built between the 13th and 15th centuries, and despoiled of all its internal decorations by the Anabaptists; Our Lady's church, with its noble tower; the splendid Gothic church of St. Lambert, in the market-place, finished in the 13th c., on the tower of which may still be seen the three iron cages in which the bodies of the Anabaptist leaders, John of Leyden, Knipperdolling, and Krechting, were suspended, after they had suffered the most horrible martyrdom; and the church dedicated to St. Ludgerus, the first bishop of Münster, with its singular round tower, surmounted by an octagonal lantern. The Gothic town-hall possesses historical interest in being the spot at which, in 1648, the peace of Westphalia was signed in a large hall, which has lately been restored, and which contains portraits of all the ambassadors who were parties to the treaty. The palace, built in 1767, is surrounded by fine pleasure-grounds, including horticultural and botanical gardens, connected with the academy; and these, with the ramparts, which, since the Seven Years' war, have been converted into public walks, form a great attraction to the city. Münster is well provided with institutions of charity and benevolence. The old Catholic university of Münster was dismembered in 1818, and its funds apportioned to other educational establishments; and the present academy, which comprises a Catholic theological and a philosophical faculty, is now the principal school. It has a library of 50,000 volumes, a natural history museum, and various collections of art and antiquity connected with it. Münster has one gymnasium, a normal school for female teachers, and a number of town schools. The industrial products of Münster include leather, woolen fabrics, thread, starch, and sugar, besides which there are good carriage manufactories, breweries, and distilleries. The trade is limited to the produce of the country, the principal of which are the noted Westphalian ham and sausages.

Münster was known under the name of Mimigardevorde in the time of Charlemagne, who, in 791, appointed it as the see of the new bishop of the Saxons, at St. Ludgerus. Towards the middle of the 11th c., a monastery was founded on the spot, which in course of time derived its present name from its vicinity to the minster, or monastery. In the 12th c., the bishopric was elevated into a principality of the empire. In the 13th c., the city was incorporated in the Hanseatic league; and in 1532 it declared its adhesion to the reformed faith, notwithstanding the violent opposition of the chapter. During the years 1535 and 1536, Münster was the scene of the violent politico-religious movement of the Anabaptists, when the excesses of these pretended reformers worked a violent reaction in the minds of the people, which had the effect of restoring the prestige of the episcopal power; and although the citizens occasionally made good their attempted acts of opposition to their spiritual rulers, they were finally reduced to submission under bishop Christopher Bernhard of St. Gall, who having, in 1662, built a strong citadel within the city, transferred the episcopal place of residence thither from Koesfeld, where it had been established by earlier bishops. In the Seven Years' war, Münster was repeatedly besieged and taken by both the belligerent parties. The bishopric of Münster, which since 1719 had been merged in the archbishopric of Cologne, although it retained a special form of government, was secularized in 1803, and divided among various royal houses; but subsequently shared in the common fate of other German provinces, and was for a time incorporated with France. The congress of Vienna gave the greater part of the principality to Prussia, a small portion being apportioned to the house of Oldenburg, while Hanover acquired possession of the Münster territories of the mediatized dukes of Aremberg.

MUNTANER', Ramon', 1265–1340, b. Spain. His native town having been burnt by the French in 1285, he became a wandering soldier and minstrel, and for 30 years led an adventurous and eventful life. Returning to Catalonia, he began in 1325 to write the history of the princes of Aragon from the time of James the conqueror until the coronation of Alfonso IV. This chronicle of great events, of which he was the eye-witness, is valuable as a history of his time and is remarkable for its accuracy, naivete, epic beauty and grace. It remained in manuscript until the middle of the 16th century. The two most ancient editions of the original are at Valencia and Barcelona. The former is entitled *Chronica o Descripcio dels fets e hazanayes del inclyt Rey Don Jaume.* It has been translated into German and French, and Lanz at Stuttgart published an edition of the original in 1844.

MÜNTER, Friedrich, 1761–1830, b. Germany; educated at Copenhagen and Göttingen, where he studied theology and archæology. He afterwards continued his archæological researches in Italy, under the patronage of the Danish government. In 1790 he became professor of theology in the university of Copenhagen, and in 1808 bishop of Zealand. He edited the Coptic translation of Daniel, and the statutes of the Templars, and wrote works on the history of Christianity in Denmark, on the inscriptions at Persepolis, and on the religion of the Carthaginians.

MUNTJAK, *Cervus muntjac, Cérvulus vaginalis,* or *Stylocerus muntjac,* a species of deer, abundant in Java, Sumatra, and other islands of the same region. It is about one-fifth larger than the roebuck, which it considerably resembles in form. The horns are remarkable, as there springs from the common base of each an additional horn, which is about 1½ in. in length; the principal horn, which is simple, curved, and pointed, being about 5 in. in length. The female has no horns. The male has large canine teeth or tusks, which also are wanting in the female. Allied species are found in India and China.

MÜNZER, Thomas, one of the leaders of the Anabaptists (q.v.), was b. at Stolberg, in the Harz, took his degree at Wittenberg as master of arts, and for some time preached the doctrines of the reformation in Zwickau and other places. Ere long, however, he adopted mystic views, and declaimed against what he called the "servile, literal, and half" measures of the reformers, requiring a radical reformation both in church and state according to his "inward light." He proclaimed an entire community of goods, and incited the populace to plunder the houses of the wealthy. Mühlhausen fell for a time under his sway and that of another fanatic named Pfeifer, who joined him. He took an active part in the peasant war, and inflamed the spirits of the insurgents by the wildest speeches and songs; but they were utterly defeated on May 15, 1525, after a severe conflict at Frankenhausen, by the elector John and duke George of Saxony, the landgrave of Hesse, and the duke of Brunswick. Münzer fled, but was taken and carried to Mühlhausen, where he was beheaded along with Pfeifer and a number of others. He showed no dignity or courage in the closing scenes of his life. See Strobel's *Leben, Schriften, und Lehren Thom. Münzer's* (Nürnb. 1795); Seidemann's *Thom. Münzer* (Dresd. and Leips. 1842); and Heinrich Leo in the *Evangelische Kirchenzeitung* (Berl. 1856).

MUN'ZINGER, Werner, b. Switzerland, 1832; educated at Bern, Munich, and Paris. In 1852 he entered into business in Egypt, but soon after went on an exploring expedition southward in Africa, and was absent for about 6 years. He was attached to the expedition of Heuglin in 1861, but quitted it when it reached n. Abyssinia, and in company with Kinzelbach explored an unknown territory, and determined the course of the river Gash. In1862 he was placed at the head of the German exploring expedition, succeeding Heuglin, and he endeavored to penetrate to Waday, but was unable to go farther than Kordofan. In 1864 he was appointed British consul at Massowah, and in the Anglo-Abyssinian war he acted as a guide to the English forces, after whose withdrawal he remained at Massowah as consul in the French service. In 1869, while on another exploring expedition to n. Abyssinia, he was attacked by an assassin and dangerously wounded. In 1870 he made a journey to s.e. Arabia, and was appointed governor of Massowah; and the next year he went on a new expedition into the country n. of the Bogos. Besides many contributions to geographical periodicals and the proceedings of geographical societies, he has published: *Customs and Laws of the Bogos,* 1869; *East African Studies,* 1864; *The German Expedition into East Africa,* 1865; and a *Dictionary of the Tigre Language.*

MUOT'TA VALLEY, a lofty and secluded valley in the canton of Schwytz, Switzerland, through which the Muotta river flows down to lake Lucerne. Its chief place is the village of Muotta, 4 m. e.s.e. of Schwytz. Pop. 1,759.

MURAD V. (Mehemet Murad Effendi), Sultan of Turkey, b. Turkey, 1840; son of Abdul-Medjid, late sultan of Turkey. On May 30, 1876, the sultan Abdul-Aziz was deposed from his throne; and on the same day Murad was visited by a high dignitary of the state and informed that he was to become sultan, whereupon he proceeded to the great hall of the Seraskierat and was duly installed. Soon after his accession he discovered his total incapacity to conduct the government in the face of the difficulties by which it was surrounded. He became subject to fits of melancholia and lethargy, from

which it was nearly impossible to rouse him. An eminent physician was sent for to Vienna, who, after an examination, pronounced his patient unfitted by the nature of his malady for the conduct of the difficult and delicate duties of his position. Upon the advice of the physician in question, the ministerial council, after referring the law questions of the case to the sheikh ul-Islam, decided upon his deposition, which was accordingly effected on Aug. 31, 1876. He was succeeded by a younger brother, Abdul-Hamid, who was proclaimed sultan on the same day.

MURÆ'NA, a genus of malacopterous fishes, of those to which the name eel is commonly given, the whole of the eels being sometimes included in the family *muræniдæ*. See EEL. The true *muræna* have no fins except the dorsal and anal, which are low and fleshy. They have one row of sharp teeth in each jaw. The head is very large, and the jaws are moved with great power. The muræna of the Romans, or MURRY (*M. helena*), abounds in the Mediterranean, and is sometimes of large size, four feet or more in length, golden yellow in front and purple towards the tail, beautifully banded and mottled. It is much thicker in proportion to its length than any of the fresh-water eels. Its flesh is white and highly esteemed. It prefers salt water, but can accommodate itself to a fresh-water pond. The ancient Romans kept and fed it in vivaria. The story of Vedius Pollio feeding his murænas with offending slaves is well known, This muræna has been caught on the British shores, but very rarely.

Allied to the genus muræna is the genus *sidera*, found in the Pacific.

MURÆ'NIDÆ. See EEL, *ante*.

MURAL CIRCLE, an astronomical instrument for taking declinations; consisting of a large circle built against the wall (whence its name), movable on its axis in the plane of the meridian, and with a telescope attached, also in the plane of the meridian, which turns about an axis. The circle is graduated, the whole instrument counterweighted and furnished with an illuminating apparatus for night readings. Readings are made accurate by set-screws and microscopic micrometers. The plane of the limb and the optical axis of the telescope are made parallel to the meridian by leveling and sweeping screws, and the cross lines of the eye-piece should follow a star near the equator their whole length. The instrument being rectified, the height of a star above the horizon is measured by a cup of mercury; the star is observed directly and then by reflexion, the half sum of the readings being the correct angle. The co-latitude of the place is obtained as with the theodolite. As the tube is movable about the circle, reading should always be checked by reiteration; with more than one limb of the circle.

MURAL CROWN, in heraldry, a crown in the form of the top of a circular tower. masoned and embattled. It is meant to represent the crown which was given by the Romans as a mark of distinction to the soldier who first mounted the walls of a besieged town, and fixed there the standard of the army. A mural crown supporting the crest, in place of a wreath, occurs in the achievements of several of the English nobility, and in various grants of arms made in the early part of the present century to officers who had distinguished themselves in the war. Viscount Beresford, in consequence of his gallantry at the battle of Albuera, obtained as crest, issuing out of a mural crown, a dragon's head with its neck pierced through by a broken spear, the head of the spear, point downwards, being held in the mouth of the dragon.

MURAT, JOACHIM, king of Naples, was the son of an innkeeper at La Bastide-Fortunière, near Cahors, in France, and was born there March 25, 1767 or 1768. He was at first intended for the priesthood, and actually commenced the study of theology and canon law at Toulouse, but entered the army, and being threatened with punishment for insubordination, deserted, and after spending some time at home, proceeded to Paris, where, it is said, he was for some time a waiter at a café, but soon obtained admission into the constitutional guard of Louis XVI. On the outbreak of the revolution, he was made a sub-lieut. in a cavalry regiment. His gallantry and his extreme republicanism soon won him the rank of colonel. He attached himself closely to Bonaparte, under whom he served in Italy and in Egypt, signalizing himself in many battles; rose to the rank of gen. of division (1799); returned with Bonaparte to France; and rendered him most important assistance on the 18th Brumaire, by dispersing the council of five hundred at St. Cloud. Bonaparte now intrusted him with the command of the consular guard, and gave him his youngest sister, Caroline, in marriage. Murat commanded the cavalry at Marengo, where he greatly distinguished himself. On the establishment of the French empire, he was loaded with honors. He continued to command the cavalry in the armies led by the emperor, and contributed not a little to the victory at Austerlitz, and to many other victories. In 1806 the newly-elected grand duchy of Berg (q.v.) was bestowed upon him. On Aug. 1, 1808, he was proclaimed king of the Two Sicilies by the style of Joachim I. Napoleon. He took possession of Naples, but the Bourbons, through the support of Britain, retained Sicily.

Murat possessed the qualities requisite for a gen. of cavalry rather than those of a king. He was very deficient in political skill and energy; but by the moderation of his government, he won the hearts of his subjects. Even his love of pomp and show, and the theatrical splendor of his equipment, which were a subject of mirth in France and Germany, rather gratified the Neapolitans. He endured with difficulty the yoke of Napoleon,

which left him little but the outward show of royalty. In the expedition against Russia, he commanded the whole cavalry, but on its failure, he returned to Naples, anxious and discontented. He joined the French army again in 1813, but after the battle of Leipzig, withdrew to his own dominions, determined on breaking the French fetters with which he was bound. He concluded a treaty with Austria, and a truce with the British admiral, and promised the allies an auxiliary corps. He hesitated, however, even after his new course seemed to have been decisively adopted; and finding his position insecure after Napoleon's overthrow, he entered into private communications with him at Elba. On the emperor's return to France, Murat placed himself at the head of an army of 40,000 men, and commenced a hasty war against Austria. He was defeated at Ferrara, April 12, 1815, and again at Tolentino, May 2. With a few horsemen he fled to Naples, where all was insurrection and commotion; thence to the island of Ischia, and found his way to France, whilst his wife and children took refuge in the British fleet. After Napoleon's final overthrow, he found refuge in Corsica, from which he proceeded in a foolhardy manner with a few followers to the coast of Naples, and proclaimed himself king and liberator, but was presently taken prisoner, and after trial by a court-martial, was shot in a hall of the castle of Pizzo, Oct. 13, 1815. See Léonard Gallais, *Histoire de Joachim Murat* (Paris, 1828), and Coletta, *Histoire des Six derniers mois de la Vie de Joachim Murat* (Paris, 1821). His widow assumed the title of countess of Lipona, and resided in the neighborhood of Trieste, where she died in 1839. His two sons went to the United States, where the elder, Napoleon Achille Murat, settled in Florida, and published a number of works on the constitution and politics of his adopted country. He died April 15, 1847. The younger, Napoleon Lucien Charles, married an American lady in 1827, but suffered several reverses in fortune, and madame Murat was obliged to open a boarding-school for the support of herself and her husband. Twice he attempted to return to France secretly (in 1837 and 1844), but failed on both occasions. The revolution of 1848, however, opened the country to him. He attached himself closely to prince Louis Napoleon; and was in 1849 French ambassador extraordinary at Turin. In 1852 he was made a senator; and in 1853 he received the title of prince. The Italian revolution appeared to present some chances for him, but nothing came of these. He was made prisoner by the Germans at Metz in 1870. He d. 1878.

MURATORI, Ludovico Antonio, a celebrated antiquary and historian, was born at Vignola, in the duchy of Modena, Oct. 21, 1672. From a very early period, his predilection for historical and literary pursuits began to manifest itself; and, having entered into holy orders, without, however, accepting any ecclesiastical office, his life was devoted partly to the literature of his profession, but mainly to researches in history, both sacred and profane, especially the history of his native country. In his 22d year, he was appointed one of the librarians of the Ambrosian library at Milan, a post which has since received equal celebrity from a successor not unworthy of the fame of Murat, the illustrious Angelo Mai (q.v.). Here he gave to the world his first publication, a collection of inedited Greek and Latin fragments, under the titles of *Anecdota Græca* and *Anecdota Latina*. But his most import labors were reserved for the capital of his native duchy, whither, in 1700, he was recalled by the duke of Modena, to take charge of the celebrated D'Este library, and of the ducal archives; his only ecclesiastical preferment being that of provost of the church of St. Mary, at Pomposa. From the date of his return to Modena, Muratori began to devote himself more exclusively to Italian history, especially to the history of medieval Italy; and his labors in this department extended over the greater part of his life. It was not until the year 1723 that the first volume of his great collection, *Rerum Italicarum Scriptores*, appeared, and the work proceeded at regular intervals for nearly 30 years, the last of the 28 folio volumes which compose it bearing the date of 1751. This immense publication, which was produced by the joint contributions of the princes and higher nobility of Italy, embraces a range from the 5th to the 16th c., and contains all the chronicles of Italy during that vast period, illustrated with commentaries and critical notices. It was accompanied by a collection of dissertations illustrative of the religious, literary, social, political, military, and commercial relations of the several states of Italy during the period, in 6 vols. folio, 1738–1742, a work which, although far from being exempt from errors, is still regarded as a treasure-house of medieval antiquities. While engaged in these prodigious labors, Muratori carried on an active literary correspondence with the scholars of the various countries of Europe, and contributed essays not unfrequently to the principal historical and literary academies, of most of which he was a member. He was the first, moreover, to undertake a general history of Italy from the commencement of the vulgar era down to his own time. It is in 12 vols. 4to, and still retains its value as a book of reference, having been continued by Coppi down to the year 1819. In his capacity of archivist of the duke of Modena, he compiled, in 2 vols. folio, the *Antiquities of the d'Este Family* (1710–40), as well as a series of historical and polemical treatises on certain territorial questions in dispute between the house of Modena and the court of Rome. To the department of classical scholarship, Muratori's collection of *Inscriptions* (6 vols. folio, 1739–43), which, in this point of view, was a necessary supplement to the collection of Gruter and the other antiquaries who had preceded him, is still acknowledged as a most important contribution; and he has also left works of standard merit in the departments of jurisprudence,

of literary criticism, of poetry, of biography, and even of the history of medical science. In the studies of his own profession, as well liturgical and historical, as dogmatical and even ascetical, Muratori, although he did not follow the method of the schools, was hardly less distinguished than if he had made these the pursuit of his life. Some of his opinions were regarded with disfavor, if not directly condemned; but his vindication of himself, addressed to the learned pope Benedict XIV., drew forth a warm and honorable testimony to the uprightness of his motives, which, without approving of the opinions to which exception had been taken, declared them free from the imputation of being contrary either to the doctrine or to the discipline of the church. Although Muratori's life was essentially that of a scholar, yet his exactness in discharging the duties of a parish priest was beyond all praise, and several of the existing charitable institutions of Pomposa were founded by him. He died at Modena, Jan. 28, 1750, in his 78th year. His works, which it would be tedious to enumerate in full detail, fill 46 vols. in folio, 34 in 4to, 13 in 8vo, and many more in 12mo. Some of these are posthumous, and were published by his nephew, G. F. Muratori, from whom we also have a life of his distinguished uncle, in 4to, printed at Omer, 1758.

MURATORIAN FRAGMENT, or CANON OF MURATORI, a very important treatise of Biblical MSS. It probably belongs to the latter half of the 2d century. It is valuable as affording evidence concerning the writings which were regarded as canonical by the churches of that day. It contains as such the gospel of Luke—which it calls the third, the existence of the first two being implied—the gospel of John, the Acts of the Apostles, 13 epistles of Paul, 1 of Jude, 2 of John, the revelations of John and Peter; the latter, however, as being not universally acknowledged. The epistles of James and of Peter, and the epistle to the Hebrews, are omitted. It was brought into notice by Muratori, a distinguished archæologist, at the close of the 17th century.

MURAVIEF, an ancient boiar family, originally of Moscow, which in 1488 was presented by Ivan Vasiliévitch I. with large estates in the province of Novgorod. Many members of this family took an important part in the military, literary, and political history of their country during the 18th and 19th centuries. The following are the most distinguished:—(1.) *Nikolaï Ieroféiévitch* was capt. in the engineer corps, and in 1752 published the first work on algebra in the Russian language. Under Catherine II. he had charge of the Russian topographical works, became lieut.gen. and governor of Livonia, and died at Montpellier in 1770.—(2.) *Mikhail Nikititch* (1757–1807). At the age of 28, Catherine II. took him from the imperial guard to tutor her grandchildren, the grand dukes Alexander and Konstantin, for whom he composed works in prose and poetry distinguished for pure style and noble sentiments. In 1796 he became curator of the university of Moscow, in 1802 senator, and in 1804 councilor of state. His works were published in 1820 in three volumes.—(3.) *Nikolaï Nasarovitch*, privy councilor, secretary of state, and until 1832 director of the imperial private chancelry, was also known as a writer. His works are published in St. Petersburg in five volumes.—(4.) *Nikolaï Nikolaïévitch* (1768-1840). He studied at the university of Strasburg, and on his return to Russia became a lieut. in the marine service. In the battle of Rotschensalm he was wounded and taken prisoner. Set at liberty by the peace of Verelä, he left the marine for the army, was appointed lieut.col., and founded near Moscow a private school for the officers of the general staff. He served in the campaigns of 1812–14 as col. and chief of staff under count Tolstoï, arranged with gen. Dumas for the capitulation of Dresden, and shortly after took part in the siege of Hamburg. He then returned with the rank of maj.gen. to his school, which in 1816 was declared to be imperial, and which he directed until 1823. During the last years of his life he became interested in agricultural pursuits and rural economy. He was one of the founders and most active members of the economic society of Moscow, and published a translation of Thaer's *Principles of Rational Agriculture*. He left five sons, all of whom became distinguished.—(5.) *Alexander Nikolaïévitch* (1792–1864), the eldest son of the preceding. In 1825 he took part in the conspiracy which broke out at the accession of Nicholas I. In consideration of his father's services his life was spared, and he was merely exiled to Siberia. Though he was afterwards permitted to return, his services were not required until the Crimean war, when he became maj.gen. and in 1856 governor of Novgorod. He was interested in the emancipation of the serfs. At the time of his death he was lieut.gen. and member of the senate of Moscow.—(6.) *Nikolaï Nikolaïévitch* (1793–1866). He entered the army in 1810, took part in all the campaigns of 1812–15, and won distinction for bravery at Borodino, Lutzen, Bautzen, Kulm, Leipsic, and under the walls of Paris. In 1817 he was attached to gen. Iermolof's staff, and served in the Caucasus. In 1822 he published his *Travels in Turkomania and Khiva*, which was translated into German, English, and French. In 1827 he became chief of staff under gen. Paskiévitch, took part in all the principal battles of the war with Persia, was promoted to the rank of maj.gen., and won great distinction at Kars and Akhalzik in the war of 1828. In 1830 the Polish rebellion broke out, and Muravief was recalled from an expedition against the Lesghians to take command of the Lithuanian grenadier brigade, with which he defeated the old Polish gen. Siéravski, near Kazimierz. Promoted to the rank of lieut.gen., he commanded the right wing at the storming of Warsaw in 1831, and captured the fortifications of Rakoviec. At the end of the next year he was sent to Egypt with special

instructions to incite Mehemet Ali to revolt against the Turkish government. He then took charge of the Russian forces which landed on the shores of the Bosporus. In 1838 he fell into disgrace, and lived secluded for ten years, at the end of which he was called again into active service, and in 1854 was made commander of the expeditionary forces in the Caucasus. After a siege which lasted from the first of June till the last of November, he captured the important fortress of Kars. This victory, which partially redeemed the loss of Sevastopol, brought Muravief the title of prince and the appellation Karski. He was then made a state councilor, and put at the head of the commission to investigate the abuses committed during the Crimean war. In 1861 he was made chief of the regiment of grenadiers of Samogitia, one of the greatest honors which the czar can accord to generals not belonging to the imperial family.—(7.) *Mikhaïl Nikolaïevitch* (1796–1866). At the age of 15 he was acting professor in the military school founded by his father. In 1813 he fought against the French, and at the conclusion of the campaign returned to his favorite study of mathematics, and translated into Russian Garnier's *Geométrie Analytique*. In 1823 he entered the army, and soon became col. In 1831 he advanced from maj.gen. to the military governorship of Grodno, and showed great activity in repressing the troubles which broke out in his province after the Polish revolution. He afterwards became military governor of Kursk, and entered the civil administration as privy councilor and senator. He was elected president of the Russian geographical society, and caused a great scientific expedition to be sent to Siberia. In 1857 he became minister of the crown lands and president of the council for the administration of the appanages of the state. He devoted his energies to the fostering of agriculture, founded an agronomic academy near Petroosk, but was violently opposed to the liberation of the serfs. In the student riots of 1861 he used such cruel modes of repression as to win universal hatred, and was removed from his functions. The Polish insurrection, however, brought him to the fore, and in 1863 he was named governor-general of Vilna with special honors. He acted with such energy that in a few months the insurrection was entirely put down. The czar, in recognition of his services, made him a count and placed him at the head of the commission to seek out and punish the accomplices of Karakasof, who attempted the assassination of Alexander II., in 1866.—(8.) *Nikolaï Nikolaïevitch*, b. 1810; entered into the army, served in the Caucasus, and by his bravery won the rank of maj.gen. and commander of the coasts of the Black sea. In 1847 he was named governor-general of eastern Siberia and made lieut.gen. He gained for Russia the entire territory of the Amur, and concluded the treaty of Aigun, May 28, 1858, by which this country was definitely ceded by China. His services were rewarded by the title of count and the name Amurski. In the summer of 1859 he went with twelve ships to Yedo, and concluded a favorable treaty with Japan. He then returned to St. Petersburg by way of Siberia. He resigned his governorship in 1861, and was named member of the imperial council.—(9.) *Andréi Nikolaïévitch* entered, at an early age, the civil administration; became councilor and kammerjunker, and about 1830 undertook a journey to Syria and Palestine, which he described in his *Pilgrimage to the Holy Places*. He subsequently traveled in his own country, in Italy, and in the east, and published the results of his observations in several volumes. He wrote also besides many theological and dramatic works, a *History of the Bible*, *History of the First Four Centuries of Christianity*, *History of Jerusalem*, *History of the Russian Church*, *Description of Georgia and Armenia*, etc. He was a member of the holy synod.—A branch of the Muravief family, about 1730, married a daughter of Apostol, the hetman of the Cossacks, whose name was added to his own.—(1.) *Ivan Matiriévitch* Muravief-Apostol (1769–1851). Under the emperor Paul, Ivan was sent to the courts of Saxony and Madrid, and on his return became privy councilor and senator. He had a thorough knowledge of the ancient and modern languages, and translated into Russian Sheridan's *School for Scandal*, the *Satires* of Horace, and the *Clouds* of Aristophanes. In 1820 he traveled in the Taurid, and published the results of his archæological investigations. His old age was saddened by the political ruin of his three sons, whom he survived for more than a quarter of a century.—(2.) *Sergii Ivanovitch* was lieut.col. of the regiment of Tchernigof, a man of remarkable energy and learning, and the leading spirit in the Dekabrist conspiracy of 1825. Despite the news of the failure of the rising in St. Petersburg, he proclaimed the grand duke Konstantin emperor, and seized the town of Vasilkof. Troops were sent against him, and, after a gallant resistance, in which he was wounded and his brother Ippolit was killed at his side, he was captured, taken to St. Petersburg, and hung in July, 1826. His other brother Matvéi was also a Dekabrist, and was sent to Siberia for twenty years.

MURCHISON, Charles, 1830–79; b. Jamaica, of Scotch descent. He studied at the university of Aberdeen from 1845 to 1851, obtaining a prize for Greek scholarship, the Balfour medal for skill in plant dissection, and the Thompson prize. After graduating at the medical school in 1851 with high honors, he went to Turin, as physician to the British embassy. On his return in 1852 he resided a short time in Edinburgh, studied in Dublin and Paris, and then accepted the position of professor of chemistry in the Calcutta medical college. He remained in India until 1855 and published a treatise on the diseases of that country. He then returned to England, and in London was connected as lecturer, demonstrator of anatomy, assistant physician, or managing physician with the Westminster general dispensary, St. Mary's, King's College, Middlesex, and the

London Fever hospitals. Besides many medical and scientific contributions to the *Lancet* and other journals, he published several treatises, the most important of which were *Diseases of the Liver* and *Continued Fevers of Great Britain.* In 1871 he was appointed professor of the principles and practice of medicine, and though his practice was very large and his published works of great scientific value, yet probably his highest claim to fame arises from his precision, power, and thoroughness as an instructor. In 1877 he was made president of the pathological society. His death was caused by heart disease, resulting from a fever contracted in his professional duties. Though for several years aware that continued rest alone could avert a sudden death, he in no way relaxed his labors, and died in his consultation room.

MURCHISON, Sir RODERICK IMPEY, geologist and geographer, was born at Tarradale, Ross-shire, in 1792. He was educated at the grammar-school, Durham, and having a bias for military life, next studied at the military college, Marlow. He entered the army at an early age, and served as an officer in the 36th regiment in Spain and Portugal. He was placed on the staff of his uncle, gen. sir Alexander Mackenzie, and then obtained a captaincy in the 6th dragoons. Quitting the army in 1816, he devoted himself to science—more especially to geology. He afterwards traveled in various parts of the globe. He found the same sedimentary strata lying in the earth's crust beneath the old red sandstone in the mountainous regions of Norway and Sweden, in the vast and distant provinces of the Russian empire; and also in America. The result of his investigations was the discovery and establishment of the Silurian system, which won for him the Copley medal of the royal society, and European reputation as a geologist. His subsequent exposition of the Devonian, permian, and Laurentian systems increased and confirmed his reputation. He explored several parts of Germany, Poland, and the Carpathians; and in 1840 he commenced a geological survey of the Russian empire, under the countenance of the imperial government. M. de Verneuil was associated with him in this great work, completed in 1845. Struck with the resemblance in geological structure between the Ural mountains and the Australian chain, Murchison, in his anniversary address in 1844, first predicted the discovery of gold in Australia. In 1846, six years before that metal was practically worked, he addressed a letter to the president of the royal geological society of Cornwall, inciting the unemployed Cornish tin-miners to emigrate and dig for gold in Australia. He was elected president of the British association for the advancement of science in 1846; president of the royal geographical society in 1844 and 1845; was re-elected in 1857, and continued to hold that post till 1870, when he was compelled to resign it by paralysis. His anniversary addresses to the geographers were of great interest and value. Perhaps no man of the present century has done more to promote geographical science at home, and kindle the spirit of adventure among those engaged in Arctic explorations on the one hand, and African discovery on the other. In 1855 he succeeded sir H. de la Beche in the office of director of the museum of practical geology. He was a D.C.L of Oxford, LL.D. of Cambridge, and a vice-president of the royal society. He was knighted in in 1846, made K.C.B. in 1853, and a baronet in 1863. From the emperor of Russia he received the grand cross of St. Anne, and also that of St. Stanislaus. He died Oct. 22, 1871. The greater portion of his contributions to science were published in the *Transactions* of the geological and other societies. His principal works were *The Silurian* (1836); *The Geology of Russia in Europe and the Ural Mountains,* in 1845 (2d ed. 1853). He also published volumes on the *Tertiary Deposits of Lower Styria, etc.* (1830), the *Geology of Cheltenham* (1834), etc.—See *Life of Sir Roderick Murchison,* by Archbishop Geikie, LL.D. (1875), and obituary notice by sir Henry Rawlinson in *Proceedings of the Royal Geographical Society,* vol. xvi. No. 4.

MURCHISO'NIA, a genus of fossil gasteropodous mollusca belonging to the family *Haliotidæ* and so named in honor of sir R. I. Murchison. The genus consists of at least 50 species, all which are characteristic of the paleozoic rocks, occurring in the series from the lower Silurian up to the permian The shell differs from the large genus *pleurotomaria* only in being very much elongated. Like it, the whorls are sculptured and zoned, the aperture is channeled in front, and the outer lip is deeply notched.

MURCIA, a former province of Spain, now subdivided into the smaller provinces of Albacete and Murcia, is situated in the s.e. of the peninsula. It is bounded on the n. by New Castile, on the e. by Valencia, on the s. by the Mediterranean, and on the w. by Granada, Andalusia, and New Castile. Area, 10,311 sq.miles. Pop. '77, 670,733 (of modern province, 451,667). In the n.e. the province is partly level; but in the s.w. it is composed of great valleys, high plateaus, and mountain ranges. The coast comprises stretches of desert. The principal river is the Segura, which flows through the middle of the province from w. to e. On the whole, Murcia is not very productive, and never will be, on account of the failure of water, partly caused by the destruction of the forests. The only fertile districts are the valleys of the Segura, and the side-valleys of Lorca, Albacete, Chinchilla, and Almansa. The Esparto wastes have remained uncultivated since the banishment of the Moriscoes in 1610; and the canal of Murcia, which is intended to irrigate the arid Campo de Cartagena, is not yet finished. Murcia is one of the most thinly peopled districts of Spain. The north yields wheat and barley; the south maize, fruits, wine, oil, silk, and hemp. Goats, sheep, and swine are reared in great numbers.

In metals, salt, and mineral springs Murcia is abundant; it has also many smelting-works for iron, lead, and copper ores, brimstone, and alum. The roads, however, are in the most wretched condition, and industry in general is still in a backward state. The province was frightfully devastated by a great earthquake, 18–21 March, 1829. Murcia was conquered by the Arabs in 711; after the fall of the caliphate of Cordova it became an independent Arab kingdom, but six years afterwards was subjugated by king Ferdinand III. of Castile in 1241.

MURCIA (the Roman *Murgi*), a large, important, and ancient town of Spain, capital of the province of the same name, on the left bank of the Segura, and near the junction of that river with the Sangonera, 50 m. s.w. of Alicante. It stands in the midst of a beautiful and luxuriantly productive *huerta* or garden, 16 m. in length, and from 7 to 8 m. wide. This *huerta* forms a portion of what is called the vale of Murcia; is well watered, has a bright green appearance even in winter; produces wheat, flax, pulse, and vegetables, and grows innumerable mulberry, orange, fig, and palm trees. The streets of Murcia are narrow but clean, and the houses are gaudily painted in pink and yellow. Its squares are filled with cypress, orange, lemon, and other southern trees. It is the see of a bishop suffragan to Toledo; the cathedral is surmounted by a tower begun in 1522, completed in 1766, and crowned by a dome from which a magnificent view is obtained. The city contains few objects of fine art, a circumstance which is accounted for by the fact that, on the occasion of its siege by Sebastiani, that general, after promising that persons and property should be respected, entered the town April 23, 1810, and rifled it of its wealth and art-treasures. Silks, linens, baskets, mats, and cordage are manufactured, and oil-mills, tanneries, and other works are in operation. Pop. 80,000.

MURDER is the crime of killing a human being of malice aforethought, and is punishable with death. It is immaterial what means are employed to effect the object. Blackstone says that the name of murder, as a crime, was anciently applied only to the secret killing of another, which the word *moërda* signifies in the Teutonic language. And among the ancient Goths in Sweden and Denmark the whole vill or neighborhood was punished for the crime, if the murderer was not discovered. Murder is defined by Coke thus: "When a person of sound memory and discretion unlawfully killeth any reasonable creature in being, and under the king's peace, with malice aforethought, either express or implied." Almost every word in this definition has been the subject of discussion in the numerous cases that have occurred in the law-courts. The murderer must be of sound memory or discretion; i.e., he must be at least 14 years of age, and not a lunatic or idiot. The act must be done unlawfully, i.e., it must not be in self-defense, or from other justifiable cause. The person killed must be a reasonable creature, and hence killing a child in the womb is not murder, but is punishable in another way (see INFANTICIDE). The essential thing in murder is that it be done maliciously and deliberately; and hence, in cases of hot blood and scuffling, the offense is generally manslaughter only. Killing by dueling is thus murder, for it is deliberate. It is not necessary, in order to constitute murder, that the murderer kill the man he intended, provided he had a deliberate design to murder some one. Thus if one shoots at A, and misses him, but kills B, this is murder, because of the previous felonious intent, which the law transfers from one to the other. So if one lays poison for A, and B, against whom the poisoner had no felonious intent, takes it, and is killed, this is murder. Formerly, in England, the benefit of clergy (q.v.) was allowed in cases of murder, till it was abolished by 7 and 8 Geo. IV. c. 28. The only sentence on murderers is now death, which is carried out by hanging. Formerly the murderer was directed after death to be hung on a gibbet in chains near the place of the crime. Formerly, also, dissection was added as part of the sentence, and the execution was to take place on the day next but one after sentence. But now an interval of a fortnight usually takes place, and the body is buried in the precincts of the prison. Attempts to murder were until recently punishable in England like capital felony; but now attempts to murder are punishable only with penal servitude for life, or for not less than three years.

*MURDER (*ante*). The common law inferred a wrongful intent from the mere fact of the killing, so that the burden lays upon the defendant of establishing his innocence of malice. Under the definition "with malice aforethought, express or implied," many kinds of homicide which are now considered to involve a much smaller degree of guilt, were classed under the one head of murder. By the common law it was murder to secure by perjury the conviction of an innocent person upon a capital charge; but at the present day such a crime would be considered only as a perjury which should receive an aggravated punishment. At the common law, too, the procuring of a person to commit suicide was murder if the suicide was accomplished. So it is said in the books that if two persons agree to commit suicide, and attempt to carry their design into execution, but only one dies, the survivor is guilty of murder if he were present at the commission of the suicide; otherwise he is an accessory before the fact. Both of the above-mentioned cases would probably now be considered as simple manslaughter. According to Hale in his *Pleas of the Crown*, if a person by threats or otherwise cause the death of another by putting him into "a passion of grief or fear," the former is guilty neither of manslaughter or murder; and such is, probably, still the law, though it has been doubted. If a number of persons conspire to commit an unlawful act, in the execution

of which murder is committed, they all are guilty of murder. The only compulsion which can excuse a murder must be an irresistible violence, such as would put a man of discretion and courage into fear for life or limb. There has been considerable controversy as to the burden of proof in cases of murder, and it has sometimes been held that, after the prosecution has shown that the death set out in the indictment was caused by the prisoner, the burden of proof then rests upon him to show justification or want of malice. The evidence relied upon may of course be either direct or circumstantial. In most of the states murder is divided into degrees, and only murder in the first degree is punished capitally. Murder committed deliberately with express malice aforethought, and murder committed, to use the words of the Massachusetts statute, "in perpetrating or attempting to perpetrate, any crime punishable with death, or imprisonment for life," is murder in the first degree; all other murder is in the second degree. The special classes of crime, outside of deliberate premeditated killing, which will constitute murder in the first degree, vary somewhat according to the statutes of each state. See *Supp.*, page 886.

MURDOCK, JAMES, D.D., 1776–1856; b. Conn., of Scotch-Irish descent. At the age of 14 he was left an orphan; graduated at Yale college in 1797; studied theology with Dr. Dwight; was for a short time principal of Hopkins grammar school, New Haven, and for a year of Oneida academy, N. Y.; licensed to preach in 1801; was pastor of the Congregational church in Princeton, Mass., 1802–15; professor of ancient languages in the university of Vermont, 1815–19; professor of sacred rhetoric and church history in the Andover theological seminary 1819–28. In 1829 he removed to New Haven and devoted himself to literary work. His published works are two discourses on the atonement; a translation of Muenscher's *Elements of Dogmatic History;* a translation of *Mosheim's Institutes of Ecclesiastical History*, 3 vols.; *Sketches of Modern Philosophy; a Congregational Catechism;* translation of *Mosheim's Commentaries*, etc.; *The New Testament;* a *Literal Translation from the Syriac Peshito Version*—the latter a very serviceable work. He was an eminent linguist and philologist, and contributed many articles to theological reviews.

MURDOCK, JAMES EDWARD, b. Philadelphia, 1811; appeared first as an actor in Philadelphia in 1829. In 1833 he appeared with Miss Fanny Kemble, and from that time was a leading actor in tragedy and comedy. In 1838 he left the stage, and opened a school in Boston for mental and physical culture. Returning to the stage he visited California in 1853. In 1855 he went to Europe, and played at the Haymarket theater with great applause. In 1857 he returned to the United States. He has distinguished himself as an elocutionist, and in conjunction with William Russell published *Orthophony, or Culture of the Voice.* He was on the staff of gen. Rousseau in the war of the rebellion, attending specially to the sick and wounded; also he gave popular readings in many parts of the country for the benefit of the U.S. sanitary commission. Since the war he has resided in Philadelphia.

MURE, WILLIAM, 1799–1860; b. Scotland; educated at Westminster school and at the university of Edinburgh; subsequently studied several years in Germany, and became a thorough classical scholar. His articles in the *Edinburgh Review* on the literature of modern languages were pronounced brilliant by Moore and Jeffrey. He published *Brief Remarks on the Chronology of the Egyptian Dynasties; A Dissertation upon the Calenddr of the Zodiac of Ancient Egypt.* In 1842 he published a *Journal* of travels in Greece and the Ionian islands, and portions of a *Critical History of the Language and Literature of Ancient Greece*, 5 vols. He also edited the *Caldwell Papers*, 3 vols. He represented Renfrewshire in parliament in 1846–55, and was lord rector of Glasgow in 1847–48.

MURET, or MURETUS, MARC ANTOINE, 1526–85; b. France; became a proficient scholar in Greek and Latin; and when but 18 lectured on Terence and Cicero in the college of Auch. In 1554 he went to Venice, where he became a friend of Paolo Manuzio, who published some of his books. In 1559, at the invitation of the cardinal Ippolito d'Este, he took up his residence in Ferrara; with him he came to Rome, where he enjoyed the favor of Pius V. and Gregory XIII. He entered the priesthood, was presented to a number of livings, and at the time of his death was professor of civil law. His principal works are *Commentarius de Origine Juris, Commentarius de Legibus*, etc., and *Notæ in Justiniani Institutiones.* In one of his *Orations* he extols Charles IX. of France for having destroyed the Protestant heresy. His Latin poems are fluent and polished, but show little poetical talent. His commentaries on various classical authors are of considerable value.

MU'REX, a Linnæan genus of gasteropodous mollusks, of which has now been formed the family *muricidæ*, belonging to the order *pectinibránchiata* of Cuvier. The sexes are distinct; the animal has a broad foot, often much expanded; the eyes are not on stalks; the shell has a straight canal in front, often prolonged through part of a very long beak; no canal behind. The *muricidæ* all prey on other mollusks, boring through the shells with their hard-toothed proboscis. The name ROCK-SHELL is often given to many species of murex; and some, from the length of the beak, are called WOODCOCK-SHELL. Some have the shell beset with long and regularly arranged spines. The whorls of the shell are marked with ridges, or *varices.* Some species of murex are found on the British coasts. Species are found in all parts of the world; the largest are tropical. The ancients

obtained their purple dye (see TYRIAN PURPLE) from species of murex, particularly *M. trunculus* and *M. brandaris*. The VENUS COMB of the Indian seas is *M. tribulus*, a very delicate and beautiful shell, with many long thin spines. Fossil *muricidæ* are numerous, but are searcely found in any formation older than the eocene tertiary.

MUREXIDE, purpurate of ammonia, or Roman purple, a curious coloring matter obtained from guano. It is similar to the purple dye or Tyrian purple of the aneients, whieh was made from a speeies of *murex*—henee its name. Murexide is a product of urie acid, and as this exists in abundance, and in a very free state, in guano, that material has been found one of the best sourees from which to obtain it. One proeess used by Mr. Rumney of Manchester, the chief manufacturer of this material, to produee murexide, is to dissolve uric acid in dilute nitrie aeid, and after evaporating for some time at a temperature a little short of boiling, whilst still hot, to add a slight excess of ammonia. Two compounds are formed by this proeess, alloxan and alloxantin, and their mutual reaction on eaeh other results in the formation of the beautiful minute green metallic-lustered crystals of murexide, whieh, in eombination with some of the eompounds of lead and mercury, yield most brilliant red and purple dyes. The use of murexide was beeoming extensive until the discovery of the aniline colors, the greater brillianey of whieh has checked its employment. Murexide is used in printing both eotton and silk goods, whieh, under the name of the "Roman-purple style," has been brought to great perfection by several large firms.

MURFREE, MARY NOAILLES (CHARLES EGBERT CRADDOCK.) See page 886.

MUR'FREESBORO', a t. in Rutherford eo., Tennessee; pop. 3,502; distant 32 m. from Nashville, on the Nashville, Chattanooga and St. Louis railroad. Its situation is attraetive and healthy, on an extended tract of level land, the soil fertile, and the climate salubrious. For 10 years, 1817–27, it was the eapital of the state. Union university, a Baptist institution founded in 1841, is situated here; there is also an important college for girls.

MURFREESBORO', BATTLE OF, known also as the battle of Stone River, began on Dec. 31, 1862, and ended Jan. 4, 1863, with the flight of the eonfederates, and the occupation of the town by the union forees. The latter had been reorganized at Nashville by gen. Roseerans, and left its position on Dec. 26; forming its line of battle, after a mareh of five days and eonstant skirmishing, on the w. bank of Stone river, the left under Crittenden resting on the river, MeCook holding the right, and Thomas the center. The eonfederate army, under gen. Bragg, was in position on the e. of Stone river, Breekenridge holding the right of the line, Polk the center, and Hardee the left. The battle began on the morning of Dec. 31 with a sharp attack by Crittenden on the enemy's right; but Roseerans's plans were at onee disturbed by his own right being driven in by the eonfederate left under Hardee. This movement neeessitated the abandonment of the original design, and Roseerans drew in his lines to support the eenter and right of his position, whieh became heavily engaged. The union line had lost its ground and 28 pieees of artillery, when nightfall put an end to the fighting for that day. Jan. 1 passed without any serious engagement, but on the afternoon of Jan. 2 the eonfederates made an attaek in foree, which was repulsed, and their lines were in turn driven in and badly broken up. There was no fighting on the 3d, and on the following day the confederates evacuated Murfreesboro'. The union strength in this battle was 43,400 men; loss, 1533 killed, 7,245 wounded, 3,000 prisoners. The confederates lost 10,000 killed, wounded, and missing out of 35,000 men.

MURGAB, a river of Central Asia, which rises on the northern border of Afghanistan, in the Hindu Kush, immediately to the n. of the sources of the Heri, (q.v.). The Murgab flows westward, then north-westward, and finally northward, passing from amongst the mountains in whieh it has its source into the desert plains of Turkestan, where the volume of its water gradually diminishes, until it finally loses itself in a swamp in the sandy plain of Merv, after a course of about 400 miles. In the upper part of its eourse it receives many tributaries, but none in the lower. The most noteworthy place on its banks is Merv, or Meru (anc. *Antiocheia Margiana*), a town of independent Turkestan, about 300 m. s.e. from Khiva. Merv was an important town in the days of the Seljuk dynasty, of which it was the eapital, but is now very ruinous.

MURGER, HENRY, 1822–61, b. Paris; received a rudimentry education, and in 1838 became secretary to count Tolstoy, a wealthy Russian nobleman residing in Paris. While in his employ he became ambitious to become a writer, and began by composing satirical poetry. Uniting with a number of young artists, authors, and others of tastes similar to his own, he formed the irregular soeiety or club to whieh he gave the name "Bohemia"; the associates being termed Bohemians, from their vagrant, gypsy life. They were adventurous and often brilliant, and bound by no ties, social or other. They soon made a name for themselves in Paris, and eventually in general literary history, on account of these features of their character and lives. Murger's reputation was established by the publieation, in 1848, of his *Scènes de la Vie de Bohême*, a strikingly characteristic work, marked by independent thought, vigorous language, and occasional pathos. He contributed romance, to the *Revue des Deux Mondes*, and published *Les Nuits d'Hiver*, a volume of poems, besides writing small pieces for the Luxembourg theater.

MURIATIC ACID. See HYDROCHLORIC ACID.

MU'RIDÆ, a family of rodent quadrupeds, containing many genera and a very large number of species, distributed over all parts of the world, and of which rats and mice may be regarded as typical examples. To this family belong also voles, lemmings, dormice, jerboas, marmots, etc. The muridæ are of the section of rodents having distinct clavicles. They have three or four molars on each side in each jaw, the molars at first furnished with rounded tubercles, which wear down till they exhibit mere roughened crowns. The typical muridæ, and those most nearly allied to them, have scaly tails. Marmots, dormice, jerboas, etc., have hairy tails. There are great diversities of structure and habits among the muridæ. All of them feed on vegetable food, but many of them are ready also to eat animal substances. The limits of the family muridæ are very differently stated by different naturalists.

MURIDÆ, (*ante*). The classification of this family of rodents varies. The marmots are there referred to the family, while by many they are placed in the family *sciuridæ* (squirrels). See MARMOT, *ante*. Again, pouched rats, and North American gophers are classed by some with the muridæ, but by others are placed in the family *saccomydæ*. See GOPHER. Jerboas are now generally regarded as constituting the family *dipodidæ*, instead of being confined to the genus *dipus*, of family muridæ. See JERBOA, *ante*. The family muridæ according to general consent, comprises rats, mice, lemmings, hamsters, muskrats or musquash and voles. See RAT, MOUSE, LEMMING, HAMSTERS, MUSQUASH, and VOLE, *ante*.

MURILLO, BARTHOLOME ESTEBAN, was b. at Seville, and baptized Jan. 1, 1618; and after receiving some education, was placed with his relative, Juan del Castillo, to study painting. Having saved a little money, which he made by painting religious pictures for exportation to South America, he went to Madrid in 1641, being then in his 24th year, was favorably noticed by his celebrated townsman, Velasquez, and through his influence, was enabled to study the *chefs-d'œuvre* of Italian and Flemish art in the royal collections. In 1645, he determined to return to Seville, though advised to proceed to Rome by Velasquez who offered him letters from the king. After settling in Seville, he received numerous important commissions, and was soon acknowledged as the head of the school there. In 1648, Murillo married a lady of fortune; he now maintained a handsome establishment, and his house was the resort of people of taste and fashion. The academy of Seville was founded by him in 1660, but he filled the office of president only during the first year. He fell from a scaffold when painting in Cadiz on an altar-piece for the church of the capuchins, returned to Seville, and soon after died from the injury he received, April 3, 1682. In early life, he painted many pictures illustrative of humble life; in these, the manner was darker and less refined than that exhibited in his later pictures, which are mostly scriptural or religious pieces. In the Louvre, and in England, there are about forty of his works. Sir David Wilkie, who greatly admired and carefully studied the Spanish school, has remarked, in reference to it: "Velasquez and Murillo are preferred, and preferred with reason, to all the others, as the most original and characteristic of their school. These two great painters are remarkable for having lived in the same time, in the same school, painted for the same people, and of the same age, and yet to have formed two styles so different and opposite, that the most unlearned can scarcely mistake them; Murillo being all softness, while Velasquez is all sparkle and vivacity."

MU'RO, an episcopal t. of s. Italy, in the province of Potenza, 17 m. n.w. of the t. of Potenza. Its castle, built on a height overlooking the ravine, was the scene of the murder of Joanna I., queen of Naples. Pop. 8,388.

MUROM', or MOOROM, a t. in the s.e. of the government of Vladimir, in European Russia, 70 m. e s.e. of Vladimir, and situated on the right bank of the Oka, a tributary of the Volga. Pop. '80, 10,700. The chief industrial establishments are tanneries and sail-cloth and linen factories. The fisheries on the Oka supply the surrounding country. Murom is also noted for its orchards and kitchen-gardens, the latter of which supply a great portion of Russia with cucumber-seed of the first quality. Gypsum quarries in the neighborhood are extensively worked during winter. There is a large trade in wheat, flax, linseed, and timber. Murom has a very picturesque appearance, and was formerly surrounded by impenetrable forests. It is frequently mentioned in the old national ballads, and is one of the most ancient towns of Russia.

MURPHY, ARTHUR, 1727–1805; b. in county Roscommon, Ireland; educated at St. Omer's college (1740–47), and spent two years in Cork in business. He then went to London and entered upon his career as literary man, dramatist, and actor. From 1752 to 1754 he published a periodical called *The Gray's Inn Journal*, and afterwards a political journal, *The Test*, both unsuccessful. As an actor he appeared at Covent Garden and Drury Lane theaters, but did not meet with much favor. He now adopted the study of law and began practice in 1757, but once more with little success. He had already published a farce, *The Apprentice*, which had some popularity, and now occupied himself entirely in writing farces and comedies. In this he gained some wealth and a high reputation as a dramatist. Among the most successful of his pieces were: *The Upholsterer; The Way to Keep Him; All in the Wrong;* and *Know your own Mind* In 1792 he

published an essay on Dr. Johnson, and soon after a translation of Tacitus: his life of Garrick was printed in 1801. A few years before his death a pension of £200 and the office of commissioner of bankrupts were bestowed on him by the English government.

MURPHY, Francis. See page 887.

MURPHY, Henry Crude, b. Brooklyn, N. Y., 1810; graduated at Columbia college in 1830; studied law, and was admitted to practice in 1833. He was made city attorney of Brooklyn, and was elected mayor in 1842. He was chosen to congress in 1843; and continued a member of that body during the next six years; being also a member of the N. Y. state constitutional convention in 1846. In 1857 he was appointed minister to Holland, where he remained until 1861, and where he added to his already comprehensive knowledge of Dutch history in its relation to that of the state of New York. He has gained distinction, both for his research and his literary skill in this department. He contributed to the periodicals in early life, and translated important writings from the Dutch for the *N. Y. Historical Collections*. He also translated, and published in 1865, specimens of the writings of the early Dutch poets of New Netherlands. Mr. Murphy has filled the position of president of the New York and Brooklyn bridge company from its formation.

MURRAIN is the generic term loosely used to designate a variety of diseases of domestic animals, but more correctly restricted to the vesicular epizootic, popularly known as the mouth and foot disease. It is a contagious eruptive fever, affecting cattle, sheep, pigs, and poultry; but rarely communicable to horses or men. It is characterized by the appearance of little bladders or vesicles in the mouth, on the lips, gums, and tongue; on the udder, and in the interdigital space; causing inability to eat, and driveling of saliva, heat and swelling of the udder, and lameness. The disorder runs a fixed and definite course usually in eight or ten days. Good nursing, comfortable lodgings, and a liberal supply of soft, easily digestible food, are the chief requisites for speedy recovery. A laxative may be given if needed. The mouth may be washed out twice daily with a mild astringent solution, which may be made with half an ounce of alum, oxide of zinc, or sugar of lead, to the quart of water. The udder in milch cows, in which the complaint is usually most serious, should be bathed with tepid water before and after milking, which must be attended to very regularly; and the feet kept clean, and washed occasionally with the lotion used for the mouth.

MURRAY, a co. in n.w. Georgia, adjoining Tennessee, bounded on the s.e. by the Coosawattee river, and on the w. by the Connasauga; 450 sq.m.; pop. '80, 8,269—8,257 of American birth, 907 colored. The surface is irregular and mountainous, and much of it heavily wooded. Gold and silver are found in some parts. The soil in the lower lands is fertile, and produces large crops of Indian corn, wheat, and oats. Smaller crops of tobacco and cotton are raised, and considerable molasses is made from sorghum. Co. seat, Spring Place.

MURRAY, a co. in s.w. Minnesota, drained by Shetek lake in the n., lake Talcot in the s., and other small lakes; 720 sq.m.; pop. '80, 3,604—2,397 of American birth. It is drained by the Des Moines and Rock rivers, the Channarambe and Oksida creeks. Its surface stretches out into broad level prairie land, tillable and adapted to grain culture, but nearly destitute of timber. It produces wheat, Indian corn, and oats; and furnishes good pasturage through the year. Co. seat, Currie Court-House.

MURRAY, Alexander, 1755–1821; b. Md.; went to sea as a boy, and when not yet of age was in command of a merchant vessel. In 1776 he was commissioned lieut. in the navy of the United Colonies, and, no vacancy then existing in the list of ships afloat, he served until the end of 1777 in the army as lieut. and capt., and was present at the battles of Flatbush and White Plains. In the year last-named he took command of a privateer, and on several letters-of-marque distinguished himself in many naval combats. He was taken prisoner, exchanged, and served as lieut. in the *Trumbull*, and in the engagement with the *Iris* was severely wounded and again made a prisoner, exchanged, and once more joined the service as lieut. of the frigate *Alliance*. In all he was in no less than 13 battles on land and sea. He became capt, in 1798, and commanded the *Montezuma* and *Constellation*, being engaged with the latter in the Tripoli war. For some time before his death he had command of the Philadelphia navy-yard.

MURRAY, Alexander, d.d., 1775–1813; b. Scotland; son of a shepherd. In his early life he showed a great desire for learning, and by the family hearth in the evening or amid his flock on the hill-side during the day he read with avidity the few books in his father's house. In 1789 he attended a school at Minnigaff. The next five years were spent in school in summer, teaching the children of the neighboring families in winter. Books were bought or borrowed; grammars and dictionaries of several languages were studied. He obtained a knowledge of the French, Latin, Greek, and Hebrew languages, and of the Anglo-Saxon, Welsh, and Arabic alphabets, and wrote a volume of poems. At the age of nineteen he entered the university at Edinburgh through the assistance of the rev. Dr. Baird of that city, who had heard of his remarkable proficiency. At the end of two years he began to study for the ministry. He contributed several articles to *Scot's Magazine* and the *Edinburgh Review*. He learned thoroughly all the European languages, and the Geez, Amharic, and Abyssinian dialects. The knowledge of the latter prepared him to edit *Bruce's Travels*, and in three years the edition appeared

in 7 vols., with a life of the author, and copious philological and antiquarian notes. In 1806 he was ordained and installed assistant and successor to the minister of Urr in the stewardcy of Kirkcudbright. In 1811 he was employed to translate a Geez letter, which had been sent to the king from the governor of Tigré. In 1812 he was elected professor of oriental languages in the university of Edinburgh. During that year he published a small work entitled *Outlines of Oriental Philology, comprehending the Grammatical Principles of the Hebrew, Syriac, Chaldee, Arabic, and Abyssinian languages.* He now began a work entitled *History of the European Languages, or Researches into the Affinities of the Teutonic, Greek, Celtic, Sclavonic, and Indian Nations*, but before the end of the first session, his health which had been feeble for some time, utterly failed, and he died in the 37th year of his age.

MURRAY, ALEXANDER, b. Penn., 1816; entered the navy in 1835, and was made lieut. in 1847. During the Mexican war he was stationed off the e. coast of Mexico, was wounded at Alvarado, and took part in the capture of Vera Cruz and Tabasco. He was attached to the coast survey 1846–9, and 1857–9. He became a commander in 1862, and the same year was in the engagements off North Carolina—Roanoke island, Newbern, Kinston, etc. In May of that year he led a naval expedition up the Pamunkey and York rivers. He was made commodore in 1871.

MURRAY, DAVID, PH.D., LL.D.; b. Delhi, N. Y., 1829; graduated at Union college 1852; was professor and principal of the Albany academy 1853–63; and 1863–73 professor of mathematics and physics in Rutgers college. In 1873 he went to Japan as an expert to advise the Japanese government in regard to educational methods, where he still remains. He published *Manual of Land Surveying,* contributed to Mori's *Education in Japan*, and was the editor of *Outline History of Japanese Education.*

MURRAY, or **MORAY**, JAMES STEWART, Earl of, sometimes called the "Good Regent," was the natural son of James V. of Scotland, by Margaret, daughter of John, fourth lord Erskine, afterwards wife of sir Robert Douglas of Lochleven. He was b. about 1531, made commendator of the priory of St. Andrews in 1538, and subsequently of the priory of Mâcon (in France). He joined the reformers in 1556, and almost immediately became the chief of the Protestant party in Scotland. In 1561 he was sent to France, to invite queen Mary to return to her kingdom; and on her arrival he became her prime minister and adviser. In Feb., 1562, he was created earl of Mar; but that earldom having been claimed by lord Erskine, the title of earl of Moray was conferred upon him instead a few months afterwards. Strongly opposed to the marriage of Mary with lord Darnley, July 29, 1565, he endeavored to oppose it by an appeal to arms; but he was easily put to flight by the queen, and obliged to take refuge in England. He did not return to Edinburgh till March 10, 1566, the day after the assassination of Riccio, in which he was an accomplice. In April, 1567 he went to France, but was recalled in August of the same year by the lords in arms against the queen, when he found Mary a prisoner in Lochleven, and himself appointed regent of the kingdom. After the escape of the queen he defeated her forces, May 13, 1568, at Langside, near Glasgow, and was afterwards one of the commissioners sent to England to conduct the negotiations against her. By his prompt and vigorous measures, zeal, and prudence, he succeeded in securing the peace of the kingdom, and settling the affairs of the church, but was assassinated at Linlithgow by Hamilton of Bothwellhaugh, Jan. 23, 1570.

MURRAY, JOHN, the name of three generations of English publishers, will forever remain associated with the palmiest days of English literature in the 18th and 19th centuries. The founder of the house, John M'Murray, was born in Edinburgh about 1745. He obtained a commission in the royal marines in 1762, and in 1768 was still second-lieut., when, disgusted with the slowness of promotion, and panting for a more active career, he purchased the bookselling business of Mr. Sandby, opposite St. Dunstan's church, London, and, dropping the Scottish prefix, became a bookseller and purchaser at "32 Fleet street." He brought out the *English Review*, and published the elder Disraeli's *Curiosities of Literature*, etc. He could himself wield the pen, as some pamphlets remain to testify. He died Nov. 16, 1793, and was succeeded in due time by his son JOHN, who was left a minor of 15 at his father's death. One of the earliest hits of John the second was Mrs. Rundell's cookery-book, which proved to be a mine of wealth—more productive, perhaps, than *Childe Harold* itself. He became connected with Thomas Campbell and sir Walter Scott, and in 1808–9 projected the *Quarterly Review*, a tory organ, in opposition to the Whig *Edinburgh Review*, then in the height of its influence. The first number was published Feb. 1, 1809, under the editorship of William Gifford. The new periodical was completely successful, and brought Murray into communication not only with the chief literati, but also with the conservat ve statesmen of the time. A still more fortunate acquaintance was that with lord Byron, whose *Childe Harold* was published by Murray in 1812. Murray now removed from Fleet street to Albemarle street, where the business is still carried on. Here Byron and Scott first met, and here Southey made the acquaintance of Crabbe. Almost all the literary magnates of the day were "four o'clock visitors" in Albemarle street. Byron's pleasant verse has described the scene:

> "The room's so full of wits and bards,
> Crabbes, Campbells, Crokers, Freres and Wards."

Murray's dinner-parties included politicians and statesmen, as well as authors, artists, and dilettanti. Murray paid Byron nearly £20,000 for his works, and his dealings with Crabbe, Moore, Campbell, and Irving were princely. The second John Murray died in his 65th year, in 1843, and was succeeded by his son, JOHN MURRAY the third. Born in 1808, he was educated first at the charter house, and afterwards at Edinburgh university. The age of Byron had gone by, when, in 1843, he succeeded to the business of his father and grandfather. A more practical and realistic age had succeeded, and the "home and colonial library," issued to beat off foreign and American piracies, was the precursor of the cheap railway and other literature of the present day. A lively and vigorous competition, arising out of the wants of a new era, has somewhat altered the relation of the great publishing houses. That of Albemarle street no longer ranks first in the extent and variety of its transactions, but many of the greatest works in history, biography, travel, art, and science have issued from the Albemarle street press under the regimé of the third Murray. Among his later successes may be mentioned Dr. Livingstone's *Travels* and *Last Journals*, Smiles's *Life of George Stephenson*, and Charles Darwin's *Origin of Species by Natural Selection*. His handbooks of continental travel have lately been supplemented by handbooks of English counties, and these, it is understood, owe much to the personal assistance and superintendence of the present head of the famous house of Murray.

MURRAY, JOHN, 1741–1815; b. Alton, England. At the age of 11 his parents removed to Cork, Ireland. He became a Methodist under the preaching of Wesley and Whitefield. Having read a book by James Relly, a Universalist, he was led to adopt his views. For this he was excommunicated at Whitefield's tabernacle, London. Persecution for opinion, pecuniary embarrassment, and grief for the loss of his wife, made him very unhappy, and he resolved to seek retirement and relief in America. He preached his first sermon in America Sept. 30, 1770, in a small church, in an obscure place in New Jersey, called "Good Luck." Believing fully in the doctrine of universal salvation, he gave himself to earnest labor, first in New Jersey and New York, afterwards in Newport, Providence, Boston, Portsmouth, Norwich, and other places in New England. In 1774 he fixed his residence in Gloucester, Mass., where he was represented as a papist, and a secret emissary of lord North in the interest of the English ministry. He was abused, and by a vote ordered to leave the town, but the interference of powerful friends saved him, and he was allowed to remain. In 1775 he was appointed chaplain of a Rhode Island brigade encamped near Boston. The other chaplains petitioned for his removal, but Washington disregarded the petition, and even showed him marked attention. Ill health required him to leave the army, and he returned to Gloucester, where he was settled over a society of Universalists. Converts to his views multiplied. He was instrumental in the organization of a convention of his sect, which met at Oxford, Mass, Sept. 1785, and took the name of Independent Christian Universalists. In 1787 he visited his native land, and preached in many places with great acceptance and power. Returning before the close of the year, he attended a convention of Universalists held in Philadelphia in 1790. In 1793 he was installed pastor of a society of Universalists in Boston, where he remained the rest of his life. He was buried in the Granary burying-ground, Boston, whence his remains were removed June 8, 1837, to Mount Auburn, where an appropriate monument is erected to his memory. He is regarded as the father of Universalism in America. He published *Letters, and Sketches of Sermons*, with an autobiography, 3 vols. He is described as possessing a "poetical imagination, a retentive memory, warm affections, and a love for all mankind." In his public discourses he spoke with "great grace of oratory, a good choice of words, and a great variety of expression." Except on the one point of universal salvation his views were in harmony with those commonly called evangelical, especially in regard to the proper divinity of Jesus Christ.

MURRAY, LINDLEY, an English grammarian, was b. at Swatara, Lancaster co., Penn., U. S., in 1745. He was educated at an academy of the Society of Friends, and, on his father's removal to New York, was placed in a counting-house, from which he escaped to a school in New Jersey. He then studied law, and was admitted to the bar at the age of 21, and commenced a good practice. During the revolutionary war he engaged in mercantile pursuits with such success as to accumulate a handsome fortune. His health failing, he came to England and purchased the estate of Holdgate, near York, where he devoted himself to literary pursuits. In 1787 he published his *Power of Religion on the Mind*, which passed through seventeen editions. His *Grammar of the English Language* was issued in 1795, and was followed by *English Exercises*, the *Key*, the *English Reader*, *Introduction and Sequel*, and a *Spelling Book*. There can be no stronger indication how entirely the systematic study of the English language was—until recent years—neglected by scholars, than the fact that Murray's grammar was for half a century the standard text-book throughout Britain and America. Murray wrote an autobiography to the year 1809, which was published after his death, Feb. 16, 1826.

MURRAY, NICHOLAS, D.D., 1803–61; b. Ireland; trained in childhood by his parents and other relatives in the Roman Catholic faith; acquired the rudiments of education in a village school; in his twelfth year came to New York and obtained employment in the house of Harper & Bros.; 1820 became a member of the Brick Presbyterian church, and, influ-

enced by the advice of his pastor, Dr. Gardner Spring, prepared for and entered Williams college, graduating there 1826, and at Princeton theological seminary 1829; in 1830 became pastor of the Presbyterian church at Wilkesbarre, Penn., and, in 1833, of the First Presbyterian church of Elizabethtown, N. J., where—declining numerous calls to important cities north, south, east, and west, and two theological professorships—he continued until his death. His personal appearance was attractive and commanding; his winning manners, abundant information, and sparkling wit made him the life of the social circle; his intellect was clear, logical, and comprehensive, and his style simple, racy, and incisive; his preparations for the pulpit were completely and yet so promptly and systematically made that he often had many sermons waiting their turn to be preached; his pastoral visitations were abundant in the abodes of the poor, the chambers of the sick, and the cheerful homes of his people; his correspondence—literary, advisory, and fraternal—was almost unlimited; with untiring industry he contributed ably and constantly to the weekly press, one series of articles published first in the *New York Observer—Kirwan's Letters to Bishop Hughes*—have obtained a circulation unequaled in religious literature, and have been translated into French, Spanish, Italian, German, and Tamil. His other published writings in book form are numerous.

MURRAY, Robert, M.D. See page 887.

MURRAY, William. See Mansfield, Earl of, *ante*.

MURRAY, William Henry Harrison, b. Conn., 1840; graduated at Yale college in 1862 and from the Yale theological in 1864, when he became pastor of a Congregational church in Greenwich, Conn., where he remained two years. He then removed to West Meriden in the same state, whence, after two years more, he was called to the Park street church in Boston. His sermons and lectures began at once to attract general attention, and from 1870 to 1874 he was one of the most popular preachers in Boston. During these years he also delivered several lectures in New England and the west, and published *Music Hall Sermons; Camp Life in the Adirondacks; Words Fitly Spoken*, and *The Perfect Horse*. In 1874 he resigned his pastorate of the Park street church, but continued to preach a year or two in Music hall to a congregation which included a part of his former one. In 1876 he established *The Golden Rule*, a religious weekly newspaper. He afterwards became practically interested in the manufacture of carriages, but soon met with losses and mercantile embarrassment. In 1879–80 he was in England, chiefly in Liverpool, engaged in business. In 1880–81 he visited Texas, looking over the state with a view to colonizing enterprises, but he finally removed to Montreal. He has entirely given up the ministry.

MURRAY, William Vans, 1762–1803; b. Md.; studied law in the Middle temple, London, and on his return was chosen a member of the Maryland legislature. He was in congress 1791–97, taking a prominent part in the debates. In 1797 he was appointed minister to Holland, and two years later envoy to France, where, in association with Oliver Ellsworth and William R. Davis, he negotiated a treaty with France, between which and this country there had been a long controversy. He resumed his post at Holland, but resigned in 1801. He published a work on the constitution and laws of the United States.

MURRAY, or MORAY, Sir Robert; d. 1673; b. Scotland; entered the French army, in which, by the influence of Richelieu, he obtained the rank of colonel. On his return to Scotland he formed a plan for the escape of Charles I., which came to nothing through the king's irresolution. He is next heard of in 1651, when he was appointed justice-clerk, and soon afterwards he was made a privy councilor and a lord of the session, but he never took his seat upon the bench. He is best known as one of the founders of the Royal Society, which was a continuation of a debating club, which used to meet in London to discuss the "new philosophy," and which obtained a royal charter in 1662.

MURRAY RIVER, the principal river of South Australia. See Australia.

MURSHEDABAD', a t. of India, capital of a British district of the same name in Bengal proper, is situated on the left bank of the Bhagratti, a branch of the Ganges, about 124 m. n. of Calcutta. On the opposite side of the river stands Mahinagar, usually reckoned a part of Murshedabad. The town occupies a great space, being several miles both in length and breadth, but the buildings are for the most part of mud. It contains two palaces: the one, old and gloomy; the other, constructed after the European style, and of great beauty, was completed in 1840. Situated on the most frequented route by water from Calcutta to the North-West provinces. The trade of Murshedabad is important. Formerly it was the capital of Bengal, and so wealthy that Clive compared it with London. Pop. (81,) 50,000, of whom about 60 per cent are Hindus, and 40 per cent Mohammedans.

MURVIE'DRO, a small t. of Spain, in the province of Valencia, and 18 miles n.n.e. of the city of that name, on the left bank of the Palancia, and two miles from its mouth. Pop. about 5,000. It stands on the site of the ancient Saguntum (q.v.).

MURZUK'. See Fezzan.

MUSA'CEÆ, a natural order of endogenous plants, the largest of herbaceous plants, generally destitute, or almost destitute of true stems, yet resembling trees in appearance, and sometimes rivaling palms in stateliness; the long sheathing bases of the leaf-stalks

combining to form a false stem. The blade of the leaf has many fine parallel veins proceeding from the midrib to the margin. The flowers are congregated on spadices, which are protected by spathes. The fruit is either a 3-valved capsule or fleshy.—The species are not numerous; they are natives of warm climates, in which they are widely distributed, and are of great value to the inhabitants of tropical countries; the fruit of some, particularly of the genus *Musa*, being much used for food, whilst the fibers of the leaves are employed for cordage and for textile purposes. See PLANTAIN, BANANA, and ABACA. A very interesting plant of the order musaceæ is the traveler's tree (q.v.) of Madagascar.

MUSAUS, JOHANN KARL AUGUST, a German writer, b. in 1737 at Jena, where he studied theology, was nominated to a country church, but prevented from entering upon the cure committed to him in consequence of the opposition of the peasantry of the parish, who refused to receive him on the ground that he had been once seen to dance. In 1763 he received the appointment of tutor to the pages at the ducal court, and in 1770 he became professor at the Weimar gymnasium. His first literary production, which appeared in 1760, was a parody of Richardson's *Sir Charles Grandison*, which was at that time extravagantly admired in Germany. The success of this satirical squib was complete; but as literary fame did not bring with it a corresponding amount of pecuniary reward, Musäus was compelled to gain his living by other means than writing; and an interval of more than 18 years elapsed before he found leisure to reappear as an author. In 1778 he published his *Physiognomischen Reisen*, in which he endeavored, by a good-natured yet striking satire, to counteract the absurd uses to which the Germans of his day had turned Lavater's system. This, like his previous work, was pre-eminently successful; and, encouraged by the marks of popular favor with which it was received, he laid aside his incognito. and continued to devote himself to authorship. In 1782 appeared his charming version of German folk-lore, under the title of *Volksmärchen der Deutschen*, which professed to be merely a collection of popular tales, noted down from the lips of illiterate old country people; but these tales were tinctured with such a blending of genial humor, quaint fancy, and strong sense, that they have become a classical work of their kind, popular among persons of every age and class. His satirical sketches, entitled *Freund Heins Erscheinungen in Holbein's Manier* (Winterthur, 1785), maintained his reputation as one of the sprightliest and most genial satirists of his country. Under the name of Schellenberg, he began a course of tales, *Straussfedern* (Berl. 1787), which, however, he did not live to complete. He died in 1787. His *Moralische Kinderklapper* appeared the year after his death, while his other posthumous writings were edited in 1791, with an interesting notice of the author, by his relative and pupil, A. V. Kotzebue. Musäus's style was at once correct and elegant, adapting itself with singular flexibility to the various subjects which he handled; while the unaffected geniality and frank loving nature which are reflected in all he wrote, have deservedly made him one of the most popular writers of his day in Germany.

MUSÆ'US, one of the ancient Greek poets of the mythic period, is said to have been the son of Eumolpus and Selene; according to others, the son and pupil of Orpheus. To him was ascribed the introduction of the Eleusinian and other mysteries into Greece, and the ordering of many religious rites. He was among the ancients also the reputed author of a number of poems, oracles, purificatory verses, a war of the Titans, a theogony, hymns, etc.; but of the few verses which remain the authenticity is very doubtful. A later MUSÆUS, who probably flourished about the end of the 6th c. of the Christian era, was the author of a very pleasing amatory poem, in Greek, entitled *Hero and Leander*, discovered in the 13th c., of which the first edition was published by Aldus Manutius about 1494, and of which there have been many subsequent editions.

MUSCADINE GRAPE, a species that grows in the extreme southern states where it is known as the Bullitt grape. The technical term given it by Linnæus is *vitis vulpina.*

MUSCÆ VOLITANTES is the term applied to ocular spectra, which appear like flies on the wing, or floating black spots before the eyes. There are two kinds of muscæ volitantes—the one a perfectly harmless kind, while the other is symptomatic of one of the most serious diseases of the eyes, viz., amaurosis.

Whoever will look through a minute pin-hole in a card at the clear sky may see floating before his sight a number of translucent tubes or fibers, and many little beads, of which some are separate, some attached to the tubes, and some apparently within them. Some of the tubes or fibers are straight, others looped or twisted, and others again forked. All these objects are bright in the middle, and bounded by fine black lines. beyond and parallel to which may be seen an appearance of colored lines or fringes. The doublings and crossings of the loops or knots in the twisted fibers appear as black points. Though the eye be fixed, these bodies change their position with greater or less rapidity. Now, in ordinary light and vision all these objects are imperceptible, unless the knots or fibers happen to be larger than usual, when they constitute the harmless kind of muscæ volitantes. The black lines and fringes are phenomena of the inflexion or diffraction (q. v.) of light, which are never seen except in divergent rays, and all muscæ volitantes having such fringes must be situated at a greater or less distance from the retina; and there are conclusive reasons for believing that they occupy the vitreous humor, and cannot therefore portend amaurosis; whereas those black spots which have no fringes, and which

do not move, or which move only with the motions of the eye, are points in the retina which are insensible to light, and are therefore to be dreaded as symptomatic of danger to vision. To decide, then, whether the muscæ volitantes are or are not indicative of danger, the patient should fix his eye on a white surface (as a sheet of letter-paper) after a sudden shake of the head; if they sink gently downwards, they are innocent. It should perhaps be added, that though they seem to descend, they must in reality be ascending; floating up in the vitreous humor as far as the cellular partitions formed by the hyaloid membrane will permit. See EYE. For further information on the differences between the innocent and the dangerous forms of muscæ volitantes, the reader is referred to an article by sir David Brewster in the *North British Review* for Nov., 1856.

MUS'CARDINE, or SILK-WORM ROT (*Botrytis Bassiana*), a fungus (see BOTRYTIS) which grows on silk-worms, and often kills them in great numbers. It consists of erect branching threads, with clusters of spores at the end of short lateral branches. The spores of this fungus germinate even on healthful silk-worms, and in circumstances otherwise most favorable to their healthfulness. They germinate also on the caterpillars of other lepidopterous insects. When this pest appears among silk-worms, its progress cannot be checked by any means known. For prevention, it is most important that the silk-worms be not overcrowded.

MUSCAT', or MASKÂT, an independent Arab state, forming the sea-cost of Omân, in Eastern Arabia. It extends from the strait of Ormus to the island of Moseirah, and nowhere exceeds 150 m. in width. The coast and interior are both sterile, but the country is studded with very fertile oases. The capital is Muscat; pop., 60,000, on the Persian gulf, a fortified town, surrounded with gardens and date-palms. It has a very good harbor, which, in the winter months, is reckoned the best refuge in the Indian ocean, and is a most important center of trade, where the productions of Europe, of Africa, and of the east are exchanged. The principal exports are Arabian coffee and pearls obtained from the Persian gulf; but wheat, dates, raisins, salt, sulphur, drugs, and horses are also exported. The independence of Omân dates from 751, when the people elected a sovereign of their own. For 900 years the Imaums were elected for personal merit, and afterwards from members of a ruling family. Muscat was taken by Albuquerque in 1507, and remained in the hands of the Portuguese till 1648, when the Arabs recovered possession of it. The Imaums afterwards made extensive conquests in eastern Africa, including Zanzibar, Mombas, Quiloa, etc. In 1798 they acquired possession of the coasts of Laristan and Mogistan, the islands of El Kishim and Ormus, and the town of Bender Abbas in Persia, paying to the shah a rent or tribute of 6,000 tomans. The state was very prosperous under the wise and mild sway of Said Seid, the late Imaum. He ascended the throne in 1803, at the age of 16, and reigned till his death in 1856. He was long a faithful ally of England. In 1854 the Imaums were driven from their Persian dependencies, which in their opinion belonged to them in perpetuity so long as they paid the rental. They recaptured Bender Abbas, but in consequence of English interfence, they were compelled to conclude a treaty with Persia in April 1856. This is said to have broken the heart of the old Seid, who died Oct. 19, 1856. He appointed his son Majid to succeed him in Zanzibar, and his son Thuwany to succeed him in Muscat. The latter was murdered by his son Salim in 1868, who reigned for a short time, but was driven out by his uncle Sayed Tuky. In consequence of the unsettled state of affairs in Muscat, Persia has assumed the government of Bender Abbas and the Persian coast territory. See ZANZIBAR and WAHABIS.—See *History of the Imaums and Seyids of Omân*, by Sahib-ibn-Razik, from the Arabic, by Rev. G. P. Badger (1781); Markham's *History of Persia* (1874).

MUS'CATEL (Ital. *moscado*, musk), the name given to many kinds of sweet and strong French and Italian wines, whether white or red. Amongst the finest are the white Rivesalt and red Bagnol wines from Roussillon, and the Lunel from the Pyrenees, the Lacrymæ Christi and Carigliano of Naples, etc.

MUSCATINE', a co. in s. e. Iowa on the Mississippi river; 440 sq.m.; pop. '80, 23,168—19,192 of American birth. The surface is varied, and the soil fertile. There are rich deposits of coal, and quarries of freestone and limestone. The chief productions are corn, wheat, rye, barley, oats, and wool. The chief articles of manufacture are carriages, metal-ware, boots and shoes, and clothing. There are also saw, flour, and planing-mills, breweries and machine shops. The Burlington, Cedar Rapids, and Northern, and the Chicago, Rock Island, and Pacific railroads pass through it. It is drained by the Cedar river. Co. seat, Muscatine.

MUSCATINE', a city of Iowa, U.S., is on the w. bank of the Mississippi, 100 m. above Keokuk, and 32 s.e. of Iowa city. It has a large trade by the river, and several railroads, three steam-flour mills, planing-machines, four large saw-mills, which annually produce about 30,000,000 ft. of timber, besides shingles, etc. There are 14 churches, schools, newspapers, etc. Pop. '80, 8,295.

MUS'CHELKALK (Ger. shell-lime), the middle member of the triassic, or new red sandstone period, the beds of which are entirely absent from the British strata. Being typically developed in Germany, the foreign name has been universally adopted to designate them. They consist of (1st) a series of compact, grayish, regularly-bedded limestone,

MUSCHELKALK PERIOD. — 1. Nautilus bisordatus. 2. Encrinus liliiformis; 3, stem thereof. 4. Ceratites nodosus. 5. Ocean in the Muschelkalk period. 6. Terebratula vulgaris. 7. Equisetum arenaceum. 8. Miophoria pes anseris. 9. Mytilus eduliformis. 10. Pemphix suerii. 11. Aspidura scutellata. 12. Gervillia socialis. 13. Turbinites dubius. 14. Rhyncholithus hirundo. 15. Tracks of the Chirosaurus. 16. Teeth and vertebra of the Nothosaurus. 17. Scene in the Keuper (upper division of triassic period). 18. Voltzia heterophylla. 19. Charitodon Tschudii.

more than 300 ft. thick; and (2d) alternations of limestone, dolomite, marl, gypsum, and rock-salt, nearly 300 ft. thick. The limestone abounds in the remains of mollusca. The paleozoic goniatites are replaced by the ceratites, a remarkable link between them and the secondary ammonities. Ceratites are distinguished by the few small denticulations of the inner lobes of the suture. The heads and stems of lily encrinites (*Encrinus*) are also abundant in these strata, and the remains of ganoid fish have also been met with.

MUSCI. See Mosses.

MUSCICAPIDÆ, a family of birds of the order *insessore* and tribe *dentirostres*, of which the greater number receive the popular name fly-catcher (q.v.). The limits of the family are, however, very variously defined by different ornithologists. The muscicapidæ are mostly inhabitants of the warmer parts of the world, in which they are very widely diffused. The species are very numerous.

MUSCIDÆ, a family of dipterous insects, having a short, thick, membranous proboscis, geniculated at the base, entirely retractile so as to be concealed within the mouth, and terminated by two large lobes (see House-fly); the antennæ three-jointed; the thorax with a transverse suture. The species are very numerous, and universally distributed. More than 800 are found in Britain, among which are the well-known house-fly, blow-fly, etc. The larvæ are maggots (q.v.). Although some of the muscidæ are troublesome, none of them are so much so as species of some other allied families.

MUSCLE AND MUSCULAR TISSUE. Muscular tissue is specially distinguished by its contractile power, and is the instrument by which all the sensible movements of the animal body are performed. When examined under a high magnifying power, the fibers of which it is composed are found to exist under two forms, which can be distinguished from one another by the presence or absence of very close and minute transverse bars or stripes. The fibers of the *voluntary* muscles—or those whose movements can be influenced by the will—as well as the fibers of the heart, are *striped;* while those of the *involuntary* muscles—the muscular structures over which we have no control—as, for example, the muscular fibers of the intestinal canal, the uterus, and the bladder, are *unstriped.*

On examining an ordinary voluntary muscle with the naked eye (a muscle from one of the extremities of any animal, for example), we observe that it presents a fibrous appearance, and that the fibers are arranged with great regularity in the direction in which the muscle is to act or contract (for it is by their inherent power of contracting that muscles act). On closer examination it is found that these fibers are arranged in *fasciculi*, or bundles of various sizes, inclosed in sheaths of areolar tissue, by which they are at the same time connected with and isolated from those adjoining them; and when the smallest *fasciculus* visible to the naked eye is examined with the microscope, it is seen to consist of a number of cylindrical fibers lying in a parallel direction, and closely bound together. These *primitive* (or, as some writers term them, the *ultimate*) fibers present two sets of markings or *striæ*—viz., a longitudinal and a transverse set. The fibers, when separated from each other, frequently split longitudinally into *fibrillæ.* Sometimes, however, when a fiber is extended, it separates in the direction of the transverse striæ into a series of disks. Either cleavage is equally natural, but the latter is the least common. Hence, observes Mr. Bowman, who has specially investigated the minute structure of voluntary muscle, "it is as proper to say that the fiber is a pile of disks as that it is a bundle of fibrillæ; but, in fact, it is neither the one nor the other, but a mass in whose structure there is an intimation of the existence of both, and a tendency to cleave in the two directions. If there were a general disintegration along all the lines in both directions, there would result a series of particles, which may be termed *primitive particles* or *sarcous elements*, the union of which constitutes the mass of the fiber. These elementary particles are arranged and united together in the two directions, and the resulting disks, as well as fibrillæ, are equal to one another in size, and contain an equal number of particles. The same particles compose both. To detach an entire fibrillæ is to extract a particle of every disk, and *vice versa.*" The fibers are supplied with vessels and nerves, which lie in the intervals between them, and are attached by their extremities through the medium of tendon or aponeurosis to the parts which they are intended to move. Aggregated in parallel series, of greater or lesser size, and associated with nerves, vessels, tendinous structures, etc., they form the various muscles which are for the most part solid and elongated, but are sometimes expanded into a membranous shape. The length of the fibers is usually about that of the muscle in which they may occur, and may vary from two feet or more (in the sartorius muscle) to less than two lines (in the stapedius muscle in the middle ear); while their width varies from $\frac{1}{60}$ to $\frac{1}{1500}$ of an inch, being largest in crustaceans, fishes, and reptiles, where their irritability, or property of contracting under the action of a stimulus, is most enduring, and smallest in birds where it is most evanescent. Their average width in man is about $\frac{1}{400}$ of an inch, being about $\frac{1}{353}$ of an inch in the male and $\frac{1}{434}$ of an inch in the female. The average distance between the striæ, or the size of the sarcous elements, in the human subject is $\frac{1}{5400}$ an inch, the extremes being $\frac{1}{15000}$ and $\frac{1}{8000}$ of an inch, according to the contraction or relaxation of the fiber. The form of the fibers is polygonal, their sides being flattened against those of the adjoining fibers. Each fiber is enclosed in a transparent, very delicate, but tough and elastic tubular sheath, which cannot always be readily seen, but is distinctly shown stretching between the separated fragments of a fiber

which has been broken within it, for its toughness will often resist a force before which its brittle contents give way. This tubular sheath is known as the *sarcolemma* or *myolemma* —the former term being derived from the Greek words *sarx*, flesh, and *lemma*, a skin or husk; and the latter from the Greek words *mūs*, a muscle, and *lemma*.

It was for a long time believed that the contraction of a muscle was associated with a change in the direction of each fiber from a straight line to a sinuous or zigzag course. The investigations of Mr. Bowman, have, however, shown that this view is erroneous. He has proved that in a state of contraction there is an approximation of the transverse striæ, and a general shortening with a simultaneous thickening of the fiber, but that it is never thrown out of the straight line, except when it has ceased to contract and its extremities are acted on by the contraction of adjacent fibers.

Muscles grow by an increase, not of the number, but of the bulk of their elementary fibers; and Mr. Bowman believes "that the number of fibers remains through life as it was in the fœtus, and that the spare or muscular build of the individual is determined by the mold in which his body was originally cast."

The structure of the *involuntary* or *unstriped* muscles must now be considered, This form of muscular tissue most commonly occurs in the shape of flattened bands of considerable length, but of a width not exceeding $\frac{1}{2000}$th or $\frac{1}{3000}$th of an inch. These bands are translucent, and sometimes slightly granular, and are usually marked at intervals by elongated nuclei, which become much more apparent on the addition of acetic acid. Kölliker has shown that every one of these bands or fibres is either a single elongated cell (a fiber-cell) or is a fasciculus of such cells. These fibres have not usually fixed points of attachment like the striated fibres, but form continuous investments around cavities within the body—such as the intestinal canal, the bladder, the uterus, the blood-vessels, etc.—or are dispersed through the substance of tissues, such as the skin, to which they impart a contractile property.

The chemical composition of ordinary (or voluntary) muscle is described in the article Flesh. It is only necessary to add that the fibrillæ, or the sarcous elements of which they are composed, consist of a substance termed Syntonine (q. v.), which closely resembles the fibrine or coagulating constituent of the blood; and that the same syntonine is also the main constituent of the unstriped muscles, or at all events of their fibre-cells. Like the blood-fibrine, it exists in a fluid form in the living tissue, and only coagulates or solidifies after death.

Our limited space prevents even an allusion to the arrangement and distribution of blood-vessels, nerves, and areolar-tissue in muscular structures; and we therefore pass on to the consideration of the muscles and their functions.

Muscles vary extremely in their form. In the limbs they are usually of considerable length, surrounding the bones and forming an important protection to the joints; while in the trunk, they are flattened and broad, and contribute very essentially to form the walls of the cavities which they inclose. There is unfortunately no definite rule regarding the nomenclature of muscles. Muscles derive their names (1) from their situation—as the temporal, pectorals, glutæals, etc.; or (2) from their direction—as the rectus, obliquus, etc., of which there may be several pairs—as, for example, rectus femoris, rectus abdominalis, rectus capitis, etc.; or (3) from their uses—as the masseter, the various flexors, extensors; or, (4) from their shape—as the deltoid, trapezius, rhomboid, etc.; or (5) from the number of their divisions—as the biceps and triceps; or (6) from their points of attachment—as the sterno-cleido-mastoid, the genio-hyo-glossus, the sterno-thyroid, etc. In the description of a muscle we express its points of attachment by the words *origin* and *insertion;* the former being applied to the more fixed point or that towards which the motion is directed, while the latter is applied to the more movable point. The application of these terms is, however, in many cases arbitrary, as many muscles pull equally towards both attachments. Muscles opposed in action are termed *antagonists*, this antagonism being in most cases required by the necessity that exists for an active moving power in opposite directions. Thus, by one set of muscles, the *flexors*, the limbs are bent; while by a contrary set, the *extensors*, they are straightened. One set, termed the muscles of mastication, closes the jaws, while another set opens them; and probably every muscle in the body has its antagonists in one or more other muscles.

The skeleton, which may be termed the locomotive framework, may be regarded as a series of levers, of which the fulcrum is, for the most part, in a joint—viz., at one extremity of a bone—the resistance (or weight) at the further end, and the force (or muscle) in the intermediate portion. In most cases, in order to preserve the necessary form of the body, muscles are applied at a great mechanical disadvantage as regards the exercise of their power; that is to say, a much larger force is employed than would suffice, if differently applied, to overcome the resistance. The two main sources of this disadvantage lie in the obliquity of the insertion, and consequently of the action of most muscles, and in the muscles being usually inserted very near the fulcrum. The first of these disadvantages is in many cases diminished by the enlargements of the bones at the joints. The tendons of the muscles situated above the joint are usually inserted immediately below the bony enlargement, and thus reach the bone that is to be moved in a direction somewhat approaching the perpendicular. If this enlargement did not exist, the contraction of the muscle, instead of causing the lower bone to turn upon the upper one with comparatively little loss of power, would do little more than cause the

two ends of the bones to press upon each other. The second mechanical disadvantage is compensated for by gain in the extent and velocity of movement, and by the avoidance of the great inconvenience of having the muscles extended in straight lines between the ends of jointed continuous levers. Thus the bones of the forearm are bent upon the bone of the arm by the biceps muscle which arises close to the head of the latter, and is inserted at a short distance from the elbow-joint, which acts as the fulcrum of the lever. By this arrangement, a contraction of a single inch in the muscle moves the hand, in the same time, through the extent of about twelve inches, but then the hand moves through every inch with only about the twelfth part of the power exerted by the muscle. By the junction of two or more levers in one direction, as in the different segments of the extremities, the extent and velocity of their united actions are communicated to the extreme one. Thus a blow of the fist may be made to include the force of all the muscles engaged in extending the shoulder, elbow, and wrist.

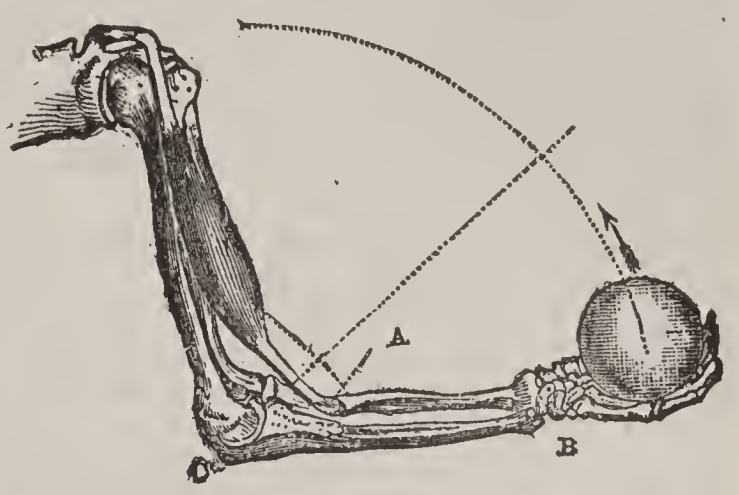

Fig. 8.

The great and characteristic property of muscular tissue—that of shortening itself in a particular direction when stimulated—is called *contractility*. The stimulus may be direct irritation by mechanical means, or by galvanism, or by some chemical substance, but in the living body the muscular fibres are, in most cases, made to contract by the immediate influence of the nerves distributed among them, which are consequently termed *motor* nerves (see NERVOUS SYSTEM), and are under the influence of the will. By an exertion of volition, we can contract more or fewer muscles at once, and to any degree, within certain limits; and as a matter of fact, there is hardly any ordinary movement performed in which several muscles are not called in play. But every voluntary muscle is also subject to other influences more powerful in their operation than the will. The movement of the features under the impulses of passion and emotion are more or less involuntary, as is shown by the very partial power the will has of restraining them, and the extreme difficulty of imitating them.

Many movements ensue involuntarily when certain impressions, which need not necessarily be attended with consciousness, are made on the surface of the body, or on any part of its interior, either by external or internal causes Such movements are termed *reflex*, and are noticed in the article NERVOUS SYSTEM. Our space precludes us from noticing the individual groups of muscles in the human body. Several important groups are, however, noticed under ARM, EYE, FOOT, HAND, LEG, etc.

MUSCLE SHOALS, an expansion of the Tennessee river in Alabama, about 250 m. from its mouth, where fresh-water muscles are found in great quantities, and a series of rapids make the river unnavigable for nearly 25 miles. During that distance, the river falls 100 feet.

MUSCO'GEE, a co. in w. Georgia, bounded on the w. by the Chattahooche river, which divides it from Alabama, and on the s.e. by Upatoi creek; 375 sq. m.; pop. 19,322, of which the greater part is colored. It is traversed by the south-western railroad of Georgia, and North and South railroad of Georgia. A part of the soil is very fertile; a part sandy, and portions of the county are covered with forests. The principal products are cotton and corn. The manufacturing interests are large, principally of cotton and woolen goods. Co. seat, Columbus.

MUSCOGEES-INDIANS. See CREEKS.

MUSCOVITE, the most common variety of mica (q.v.); synonyms—Muscovy glass, biaxial mica, oblique mica, potash mica, common mica, *verre de Muscovie*. Trimetric crystallization, usually in hemihedral forms, with a monoclinic aspect; hexagonal prisms; cleavage parallel to the base, and easily separated, forming very thin, elastic plates, which are used in stoves under the name of "isinglass," and in Russia in windows, whence called Muscovy glass. The leaves are sometimes aggregated together in stellate, plumose (plumose mica), or globular forms, or in scales, which are sometimes in masses. Hardness, 2 to 2.5; sp. gr., 2.75 to 2.31 (Dana). Luster, pearly; color, white, gray, pale green, violet-yellow, brown and dark olive-green, and the colors vary in axial and diametral directions. In transmission of light it ranges from transparent to translucent. In general terms it is a silicate of potash and alumina, containing iron, and frequently small quantities of manganese, and hydrofluoric acid (see FLUORINE, *ante*). A specimen from Uto, analyzed by Rose, gave: silica, 47.50; alumina, 37.30; peroxide of iron, 3.20; peroxide of manganese, 0.90; potash, 9.60; hydrofluoric acid, 0.56; it contained also 2.63 of water. A specimen from Abborfoss contained: silica, 39.45; alumina, 9.27; peroxide of iron, 35.78; magnesia, 3.29; potash, 5.06; fluorine, 0.29; calcium, 0.32, iron, 1.45, manganese, 2.57 = 90.59 (Svanberg). Mica fuses with some difficulty before the mouth of the blow-pipe to a grayish, blebby mass; easily dissolves in borax and phosphorus salt,

Fine crystals of Muscovite occur in granite at Acworth, Grafton, and Alstead, N. H., the plates being sometimes 3 ft. across and perfectly transparent. It occurs in Massachusetts at Chesterfield with albite, and in brown, hexagonal crystals at the Middletown, Conn., feldspar quarry. At Warwick, N. Y., crystals and plates a foot and more in diameter occur in a vein of feldspar. In St. Lawrence co., 8 m. from Potsdam, on the road to Pierrepont, it occurs in plates 7 in. across; and near Saratoga in reddish brown crystals with chrysoberyl; on the Croton aqueduct, near Yonkers, in rhombic prisms, with transverse cleavage; in fine, hexagonal crystals of dark brown in Chester co., Penn.; in Philadelphia co., smoky brown, with hexagonal internal bands; and at Chestnut hill, near the Wissahickon, is a green variety. It is found in Maryland, at Jones's falls, 2 m. from Baltimore, and various other localities, for which see Dana's *Mineralogy*.

MUSCOVY. See Russia, *ante*.

MUSCOVY DUCK. See Musk Duck, *ante*.

MUSCULAR FORCE, Origin of. Until the year 1866 the universally accepted theory on this subject was that of Liebig. According to him, non-nitrogenous food is consumed entirely in the production of heat; while muscular energy is due to the waste of the nitrogenous muscular tissue, and therefore of nitrogenous food. Muscular exercise should, if this were the case, cause very distinct increase in the nitrogenous excretions of the body, as well as greater elimination of non-nitrogenous substances.

But the experiments of Fick and Wislicenus, made during an ascent of the Faulhorn, led them to deny altogether the increase of excretion of nitrogen, and to come to the conclusion that the energy generated in the muscles is the result of the burning (oxidation) of non-nitrogenous substances (fats and carbo-hydrates), and not of the burning of the albuminous constituents of muscular tissue; and they conclude that the nitrogenous constituents of muscles are rather to be regarded as forming the machine in which these substances are burned than as being themselves destroyed. (For a translation of their memoir, see *Phil. Mag.*, June, 1866, supplementary number).

Dr. Frankland (*Philosophical Magazine*, Sept., 1866) arrives at the conclusion that the non-nitrogenous constituents of the food, such as starch, fat, etc., are the chief sources of the actual energy, which becomes partially transformed into muscular work. He does not, however, deny to the albuminous matters a co-operation in the production of muscular power, but he regards their chief use as being to renew the muscular tissue. The muscles are thus the source both of animal heat and of muscular energy.

Dr. Parkes, in a long and careful series of experiments (see *Proceedings of the Royal Society*, vols. xv., page 339; xvi., page 44; xix., page 349; and xx., page 402), examined the effect of exercise, both with a non-nitrogenous and with a nitrogenous diet. He found no marked increase, but often a diminution, of the nitrogenous substances excreted during exercise, though subsequently a slight increase took place.

Dr. Pavy, in a series of elaborate experiments recorded in the *Lancet* (Feb., Mar., Nov., Dec., 1876; Jan., 1877), comes to a similar conclusion. He says: "The theoretical deduction to be drawn from the investigation which has been conducted is that, although the elimination of urinary nitrogen is increased by muscular exercise, yet the increase is nothing nearly sufficient to give countenance to the proposition that the source of the power manifested in muscular action is due to the oxidation of muscular tissue."

The theory of muscular action which Dr. Parkes proposes is as follows: During action the muscles appropriate nitrogen; this act is accompanied by changes in the carbo-hydrates, which lead to the manifestation of mechanical force; these changes lead to effete products (lactic acid, etc.) in the muscles, which, as appears from Ranke's experiments, stop their contraction. Then ensues an action of oxygen upon the nitrogenous framework of the muscle, and a removal of the effete products of the carbo-hydrates, so that the muscle becomes again capable of appropriating nitrogen, and of acting.

But, although some such theory as this finds favor with most physiologists, and agrees with most of the experiments on the subject, it is not universally accepted.

Dr. A. Flint of New York made observations on Weston, the American pedestrian, which seemed to show that, in his case at least, the excretion of nitrogen is very distinctly increased, both during and after severe muscular work. He accordingly comes to the conclusion that "the exercise of muscular power immediately involves the destruction of a certain amount of muscular substance, of which the nitrogen excreted is a measure." That is to say, he adheres to the original view of Liebig. His experiments are described in the *Journal of Anatomy and Physiology*, vol. xi., page 109; and his views are developed in the same journal, vol. xii., page 91, where also numerous references are given to other works and papers on the subject.

All observers are agreed that the amount of carbon excreted in the form of carbonic acid is very largely increased during exercise.

Besides the papers named above, the following may be consulted for a *résumé* of the subject: Liebig, in *Pharmaceutical Journal and Transactions*, 1870; Voit, in *Zeitschrift für Biologie*, 1870; Foster, *Text-Book of Physiology*, page 323.

MUSES, in the classic mythology, divinities originally included amongst the nymphs, but afterwards regarded as quite distinct from them. To them was ascribed the power of inspiring song, and poets and musicians were therefore regarded as their pupils and favorites. They were first honored among the Thracians, and as Pieria around Olympus

was the original seat of that people, it came to be considered as the native country of the muses, who were therefore called *Pierides*. In the earliest period their number was three, though Homer sometimes speaks of a single muse, and once, at least, alludes to nine. This last is the number given by Hesiod in his *Theogony*, who also mentions their names—Clio (q.v.), Euterpe (q.v.), Thalcia (q.v.), Melpomene (q.v.), Terpsichore (q.v.), Erato, Polyhymnia (q.v.), Urania (q.v.), and Calliope (q.v.). Their origin is differently given, but the most widely spread account represented them as the daughters of Zeus and Mnemosyne. Homer speaks of them as the goddesses of song, and as dwelling on the summit of Olympus. They are also often represented as the companions of Apollo, and as singing while he played upon the lyre at the banquets of the immortals. Various legends ascribed to them victories in musical competitions, particularly over the sirens (q.v.). In the later classic times, particular provinces were assigned to them in connection with different departments of literature, science, and the fine arts; but the invocations addressed to them appear to have been, as in the case of modern writers, merely formal imitations of the early poets. Their worship among the Romans was a mere imitation of the Greeks, and never became truly national or popular. Among the places sacred to them were the wells of Aganippe and Hippocrene on Mount Helicon, and the Castalian spring on Mount Parnassus.

MUSE'UM (Gr. *mouseion*), originally the name given by the ancients to a temple of the Muses, and afterwards to a building devoted to science, learning, and the fine arts. The first museum of this kind was the celebrated Alexandrian museum (see ACADEMY). After the revival of learning in Europe, the term museum was sometimes applied to the apartment in which any kind of philosophical apparatus was kept and used; but it has long been almost exclusively appropriated to collections of the monuments of antiquity and of other things interesting to the scholar and man of science. In this sense it began to be first used in Italy, and probably in the case of the famous Florentine museum, founded by Cosmo de Medici, which soon became a great and most valuable collection of antiquities. Nothing analogous to the museums of modern times existed amongst the ancients, the greatest collections of statues and paintings which were made in the houses of wealthy Romans having been intended for splendor rather than for the promotion of art. The name soon ceased to be limited to collections of antiquities, and sculptures, and paintings; collections illustrative of natural history and other sciences now form a chief part of the treasures of many of the greatest museums, and there are museums devoted to particular branches of science. Of the museums of Britain, the British museum (q.v.) is the greatest; that of Oxford, founded in 1679, is the oldest.—The museum of the Vatican, in Rome, contains immense treasures in sculptures and paintings, and also in books and manuscripts.—The museum of the Louvre in Paris, that of St. Petersburg, and those of Dresden, Vienna, Munich, and Berlin, are amongst the greatest in the world. The usefulness of a museum depends not merely upon the amount of its treasures, but, perhaps, even in a greater degree upon their proper arrangement; and whilst great collections in the chief capitals of the world are of incalculable importance to science, its interests are also likely to be much promoted by those local museums, still unhappily not numerous, which are devoted to the illustration of all that belongs to particular and limited districts. Museums appropriated to the illustration of the industrial arts—their raw material, their machines, and their products—and of everything economically valuable, are of recent origin, but their importance is unquestionably very great. Pre-eminent among institutions of this kind in Britain are the South Kensington museum in London, and the Museum of science and art in Edinburgh.

MUSGRAVE, ANTHONY, b. Antigua, 1828; appointed secretary of Antigua, and afterwards administrator of Nevis. He was lieutenant governor of St. Vincent 1861–64, when he became governor of Newfoundland, where he remained till 1869, when he was appointed to the same position in British Columbia. He went out to Natal as lieutenant governor in 1871, was made governor of South Australia in 1873, and is now (1881) governor of Jamaica.

MUSGRAVE, GEORGE WASHINGTON, D.D., LL.D.; b. Philadelphia, 1804, of north-Irish and German descent; studied at the college of New Jersey and Princeton theological seminary, but was prevented by ill health from taking a degree; entered the ministry in 1828; was pastor of the Third Presbyterian church in Baltimore in 1830–52, and of the North Tenth street church in Philadelphia in 1862–68; was corresponding secretary of the Presbyterian board of publication in 1852–53, and of the board of home missions in 1853–61, and also in 1868–70. He has been a director of Princeton seminary since 1837, and a trustee of the college of New Jersey since 1859. He is an earnest Presbyterian, a rigid Calvinist, a leader in ecclesiastical affairs, and an able debater.

MUSH'ROOM, or AGARIC *Agaricus*, a genus of fungi, of the suborder *hymenomycetes*, having a *hymenium* of unequal plates or gills on the lower side of the *pileus*. The species are very numerous. Many of them are poisonous, many are edible, and some are among the most esteemed fungi. The species most esteemed in Britain is the COMMON MUSHROOM (*A. campestris*), a native also of most of the temperate regions both of the northern and of the southern hemisphere, and of which a very large and fine variety occurs in eastern Australia. It is found during summer and autumn (but chiefly

in autumn) in pastures, orchards, vineyards, etc. Its *pileus* is regularly convex, becoming almost flat when old; fleshy, dry, white with a tinge of yellow or brown; of a silky smoothness on the upper surface, or somewhat scaly, but never warty; thickly set on the under side with very unequal gills, which in a young state are pink, and afterwards become dark brown. The pileus is attached by its center to the top of the stem. The stem is of a firm fleshy texture, and *towards the top* is surrounded by a more or less distinct white membranous ring, the remains of the curtain or vail (*indusium*), which in a young state extends to the pileus, and covers the gills. This mushroom is gathered for the table when young, being preferred when the vail is still unbroken, and the unexpanded pileus has the form of a ball or button; but both in this state, and afterwards, whilst it shows no symptoms of decay, it is used for making ketchup (q.v.). It has a very pleasant smell and taste, and the flesh, when bruised, assumes a reddish-brown color.—Very similar to it, and often sold instead of it in London and elsewhere, but rejected by all skillful housekeepers as unfit even for making ketchup, is the St. George's Agaric (*A. Georgii*), sometimes called *whitecaps*, frequent in moist pastures and near buildings in all parts of Britain. This species is easily distinguished by its larger size—the pileus being sometimes 18 in. broad—its coarser appearance, its rather disagreeable smell, the yellow color which its flesh assumes when bruised, and the lighter color of its gills.—Care must be taken not to confound the common mushroom with the white variety of *agaricus phalloides*, a species not uncommon in Britain, chiefly in woods and on the borders of woods, which is very poisonous. Perhaps it is the possibility of this mistake which has led to the prohibition of the common mushroom in Rome, where many kinds of esculent fungi are brought in great abundance to the market, and where a special officer superintends the sale of them. *A. phalloides* is, however, easily distinguished by the ring at the *bottom* of the stem, the white color of the gills, the warts on the upper surface of the pileus, and the powerful smell, which becomes extremely disagreeable as the mushroom grows old.—Another species of mushroom much in use for the table is the Fairy-ring Mushroom (*A. oreades*), sometimes called *Scotch bonnets*—the *Champignon* of the French. It is common in pastures in Britain and most parts of Europe, often forming fairy rings (q.v.). It is much smaller than the common mushroom, the pileus being seldom more than an inch broad, the stem taller inproportion. The stem is solid, fibrous, and tough, with no ring; the pileus smooth, fleshy, tough, convex, with a more or less distinct boss (*umbo*) in the center, of a watery-brown color; the flesh white. The odor is strong, but agreeable. This mushroom is used for ketchup, and is also dried and powdered for use at table as a savory addition to sauces and stews. It is constantly brought to market in England. It is liable, however, to be confounded with several poisonous species; but only one of them, *A. dealbatus*, forms fairy rings, and this may be readily distinguished by its disagreeable odor, by its becoming grayish-brown in zones when soaked in water, by the margin of the pileus being at first rolled inwards, and by its very fine dingy whitish gills.—The other edible species of mushroom or agaric are numerous, but they are chiefly used on the continent of Europe, and scarcely at all in Britain, although some of them are common British plants.—The Orange-milked Agaric (*A. deliciosus*), which grows chiefly in fir-woods and among junipers, has a viscid pileus, 4 in. or more broad, at first orange, afterwards pale, the gills and juice orange, the gills running down the stem, the smell and taste agreeable.—The Mousseron (*A. prunulus*) is common in woods and pastures, particularly on sandy soils. It has a pileus about 2 to 4 in. broad, convex, yellowish-white when young, the gills at first white, and afterwards flesh-colored. The odor is agreeable. It is much esteemed on the continent as an article of food.—The Parasol Agaric (*A. procerus*) is found in pastures, especially under trees. It loves sandy soils. It is remarkable for its long stem, 8 to 12 in. high, with a thick spongy ring. The pileus is 3 to 7 in. broad, at first obtusely conic, then bell-shaped, covered with brown scales. The taste and smell are pleasant.—The White Field Agaric (*A. virgineus*) is one of the most common of British species, growing in pastures, with viscid or satiny white or whitish convex pileus, fully an inch broad, stem nearly 2 in. long, and light chocolate-colored distant gills, which run down the stem. It grows either singly or in groups.—The Anise Mushroom, or Sweet-scented Agaric (*A. odorus*), grows in shady woods and dells among moss and decaying leaves. It has a slightly convex pileus, about 3 in. broad, with pale gills. The odor is like that of anise.—The Ivory Mushroom (*A. eburneus*) is found in woods, with pileus 2 to 3 in. broad, of a grayish-yellowcolor, broad gills, and a rather long and somewhat scaly stem.—The Smoky Mushroom (*A. fumosus*), with pileus smoke-gray above, the gills and stalk yellowish, is common in fir-woods.—All these are edible, and more or less pleasant and nutritious. Finer than most of them is the Imperial Mushroom (*A. cæsarius*), the *Kaiserling* of the Germans, a species found in loamy soils in some parts of Europe, with orange pileus and lighter yellow stem and gills; but, unhappily, it is apt to be confounded with the very poisonous *amanita* (q.v.) *muscaria*.

The common mushroom is frequently cultivated both in the open garden and in houses or sheds. To grow it in the open garden, beds are prepared, generally of earth mixed with horse-dung, partly fresh and partly from old hotbeds, and are raised into ridges almost as high as broad. To grow it in houses, boxes are filled with alternate layers of half-rotten horse-dung and of straw, with a surface layer of fine mold. But of each of these methods there are many different modifications, none of which can here

be detailed. In both, the production of mushrooms is sometimes left to the chance—often almost a certainty—of spawn (*mycelium*) or spores existing in the dung or earth; sometimes, to increase the probability of a speedy and abundant crop, earth is introduced into the bed or box from a pasture known to be rich in mushrooms, and mushroom spawn is also frequently planted, which is either collected where mushrooms grow, or produced by artificial means, often appearing and being propagated extensively without the development of the mushroom itself. The almost certain production of mushroom spawn in heaps of slightly fermenting horse-dung, straw, and earth, has been often urged as an argument in favor of the equivocal generation of fungi, but the minuteness and multitude of the spores may more reasonably be urged on the opposite side.

MUSIC (Gr, *mousike*, from *mousa*, muse: Lat. *musica*), a combination or succession of sounds having the property of *pitch*, so arranged as to please the ear. The pleasure derived from music arises from its exciting agreeable sensations, and raising pleasing mental images and emotions. Apart from words, it expresses passion and sentiment, and linked to words, it loses its vagueness, and becomes a beautiful illustration of language.

The doctrine of musical sounds is based on the principles of acoustics (q.v.). Sound is conveyed through elastic media by waves, not of alternate elevation and depression, but of alternate condensation and rarefaction; in which it is the form, the condition of the groups of particles that progresses, not each individual particle. When a series of vibrations recur on the ear at precisely equal intervals of time, following each other so closely that each cannot be separately distinguished, the result is a musical sound or note. The sound ceases to have a musical character when each pulsation is individually audible, as is the case when there are fewer than about sixteen beats in a second. The gravity or sharpness of the sound is called its pitch, and depends on the number of vibrations in a given time. A succession or progression of musical sounds following each other constitutes melody; the difference in pitch between any two of them is called an interval. Where two or more musical sounds, whose relative pitch is properly proportioned, are heard simultaneously, the result is a chord, and a succession of chords constitutes harmony.

When a vibration is communicated to a string stretched between two points, the result is a musical note, whose pitch is dependent on the length of the string and the degree of tension applied to it: the shorter the string, and the greater the tension, the higher is the pitch. If the string be devided in the middle, the tension remaining the same, the note produced is twice as high in pitch, and is called the octave to the note produced by the whole string. Every vibration of the one corresponds to two of the other, and there is between a note and its octave a far closer relation than between any two other notes; they go together almost as one sound, and are considered to a great extent as one musical sound. In the diatonic scale, familiar to every correct ear, there are six notes, bearing certain harmonic relations to the fundamental note, interposed between it and its octave; and as we ascend, the notes arrange themselves in similar successions of sevens, each set an octave higher, or double the pitch of that which preceded it. The seven notes are designated by the names of the first seven letters of the alaphabet, the same letter being used for any note and its octave. For another notation also in use, see SOLMIZATION. Taking C for the fundamental note, we have for our scale.

$$\dot{C}\ D\ E\ F\ G\ A\ B\ \dot{C}\ D\ E\ F\ G\ A\ B\ \dot{C}, \text{ etc.}$$

The scale may be extended up or down indefinitely, so long as the sounds obtained continue to be musical. The satisfaction and sense of completeness which the diatonic scale gives the ear, arise from its being founded on correct harmonic principles. The quality called harmony is produced by a coincidence of vibrations; notes are more harmonious the oftener their waves coincide. Besides the octave, two of whose waves coincide with one of the fundamental, there are other intervals harmonious, though in a less degree. Dividing our string into three parts instead of two, we have a note higher than the octave, which may be lowered by an octave by making the string two-thirds of the original length, and produces a wave of which three coincide with two of the fundamental. Next to the octave, this note stands in the most intimate relation to the fundamental; it is called the dominant. Dividing the string by five, and lowering the note two octaves, another harmonic is got, called the mediant. In contradistinction from both these, the fundamental note (or any of its octaves) is called the tonic or key-note. C being taken as the key-note, E is the mediant, and G the dominant. These three notes, when struck simultaneously, form the harmonic triad, and stand to each other in the relation of 1, $\frac{5}{4}$, $\frac{3}{2}$, (numbers indicating the number of vibrations, which are inversely as the length of the string), or, reducing fractions to integers, in the relation of 4, 5, 6. When a musical string is vibrating, these sounds are heard on close observation more or less distinctly vibrating along with it, the cause being a spontaneous division of the string into aliquot parts, producing subordinate vibrations simultaneously with the principal vibrations. But the dominant may in its turn be the tonic from which another triad of tonic, mediant, and dominant is taken, forming a scale of triads extending indefinitely up and down, and it is from three such adjacent triads that the diatonic scale originates. Its elements

are the triad of the tonic united with the triads which stand in the most intimate relation to it—viz., those immediately above and below it—

F A C, C E G, G B D.

F is the note whose dominant is C (the tonic), and therefore, in respect of C, it is called the subdominant. A is the mediant of the subdominant F, and therefore called the submediant. D is the dominant of the dominant, and is called the super-tonic. B, the mediant of the dominant is called the leading note. We have seen that the notes of each triad stand to each other in the relation of 4, 5, 6. Preserving this proportion, and multiplying to avoid fractions, we have

F A C E G B D
as 16, 20, 24, 30, 36, 45, 54

We must multiply F and A by 2, and divide D by 2, to bring them within the compass of an octave, and then we have

C D E F G A B C
as 24, 27, 30, 32, 36, 40, 45, 48

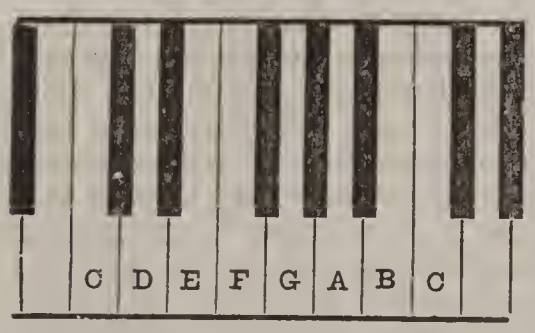
These are the degrees of the diatonic scale, which are indicated by the white keys of the pianoforte, as in the figure represented below.

The interval CD is commonly called a second; CE, a third; CF, a fourth; CG, a fifth: CA, a sixth; and CB, a seventh; CC being, as already seen, an eighth or octave—names corresponding to the position of the notes on the key-board or in the diatonic scale, but having no relation to the proper proportional numbers already given. The intervals of the third, fifth, and sixth (counting from the key-note), owing to the more intimate harmonic relation of the notes between which they lie, afford more satisfaction to the ear than the others, or are, as it is called, the most perfectly consonant intervals. Intervals may be counted from any note as well as the tonic. DF is called a third as well as CE, although these intervals are unequal. We may have intervals beyond the octave; they are, however, substantially but repetitions of those below, CD, a ninth, being also a second, and so on.

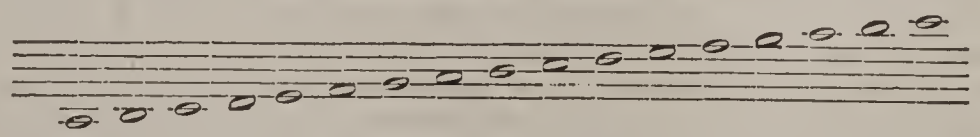
It is often desirable in the course of a musical composition to change the key-note, which involves the formation of a diatonic scale on some other note than C, in which case we are said to modulate from one key into another. As the intervals CD, DE, EF, etc., are by no means all equal, the notes which we have already got will not do for a scale founded on any other tonic than C. The ratios of the intervals in the diatonic scale, expressed in numbers by logarithms, are:

C D E F G A B C
51 46 28 51 46 51 28

At first sight it would appear that in keyed instruments there must be a separate row of keys for each tonic, but practically this is found not to be necessary. If D instead of C be taken as key-note, E, G, and A are some approach to the correct second, fourth, and fifth, but F and C are greatly too low in pitch for a proper third and seventh. With some notes taken as key-note, the correspondence is greater, with others it is less. The difficulty is overcome by a system of compromises called temperament (q.v.). Roughly speaking, we have in the diatonic scale an alternation of two long intervals, a short interval, three long intervals, and a short interval. The long intervals 51 and 46 are styled tones, and the short interval 28 a semitone. Were the tones all equal, and the semitone exactly half a tone, a note interposed in the middle of each tone, dividing the seven intervals into twelve, would make it immaterial where the scale began. A system founded on this supposition is the remedy actually adopted in most keyed instruments, and the inaccuracy produced by this compromise is not sufficiently great to offend the ear. The interposed notes, indicated by the black keys of the pianoforte (see fig.), complete what is called the chromatic scale, consisting of twelve intervals approximately equal.

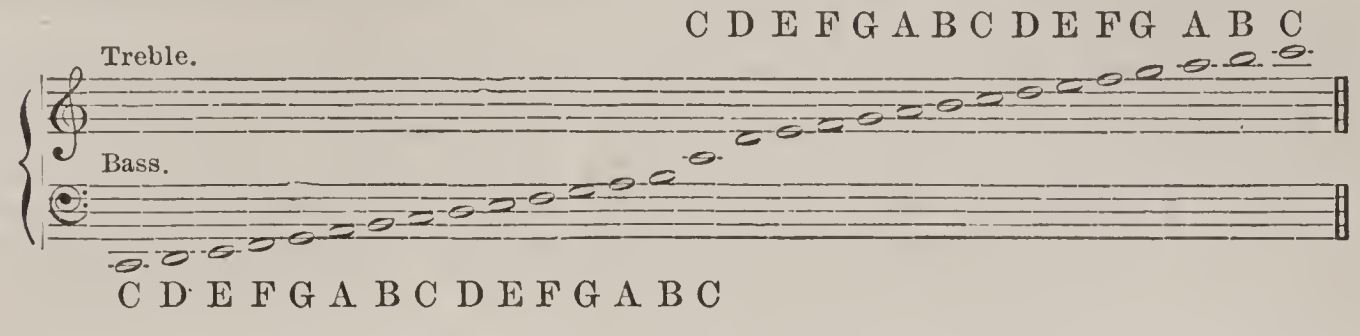


The notes of music are represented in ordinary notation on a series of five parallel lines, called the staff. On these lines, and in the four spaces between them, marks are placed indicating the notes, which are counted upwards, beginning with the lowest line. Every line or space is called a degree, the staff consisting of nine degrees.



When more than nine notes are required, the spaces below and above the staff are used, and the scale is extended by means of short added lines, called leger lines. The pitch of the notes on the scale is determined by a figure called a clef (*clavis*, a key),

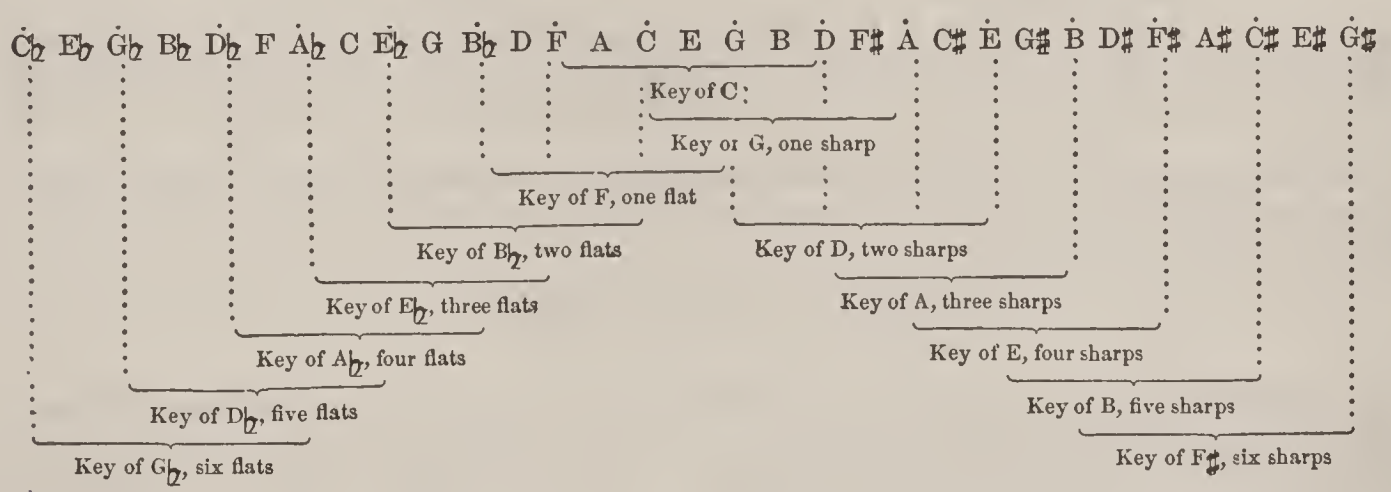
placed at the beginning of the staff on a particular note, from which all the others are counted. The clefs most in use are the bass, tenor, and treble clefs, represented on the notes F, C, and G respectively (see CLEF). The treble and bass clefs only are used in music for keyed instruments, and when a staff is required for each hand they are joined together by a brace, the upper staff for the right hand, the lower for the left. The ascending scale in these clefs is as follows:



These notes correspond with the white keys of the pianoforte or the diatonic scale when C is key-note, no allowance being made for the black keys, which, as we have seen, divide the tones into semitones. Those semitones which do not occur with C as key-note are represented by the signs ♯ (sharp) and ♭ (flat). The sign ♯, prefixed to a note, elevates it a semitone in the scale, raising, for example, F to F sharp. ♭ lowers the note by a semitone, depressing B to B flat. When a note which has been elevated by a sharp, or depressed by a flat, is to be restored to its original place, the character ♮ (natural) is prefixed to it.

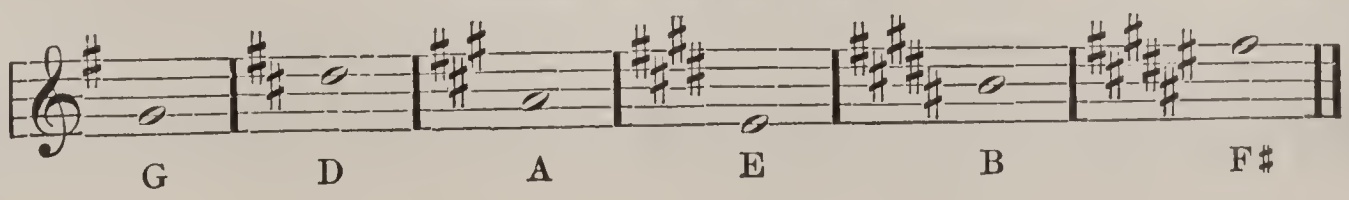
The names of the intervals correspond to the degrees of the staff, but it has been seen that intervals of the same name are not necessarily equal. If the sign of a flat or a sharp be prefixed to either note of an interval, it still preserves its name of a third, a fifth, etc.; but to distinguish intervals of the same degree, the qualifying epithets of major and minor, augmented and diminished, are used.

The different keys in music are best understood by reverting to the scale of triads, on which the diatonic scale is founded Taking a series of triads, of which the dominant of each is the key-note of the next, we obtain the following scale, extended both upwards and downwards from C:

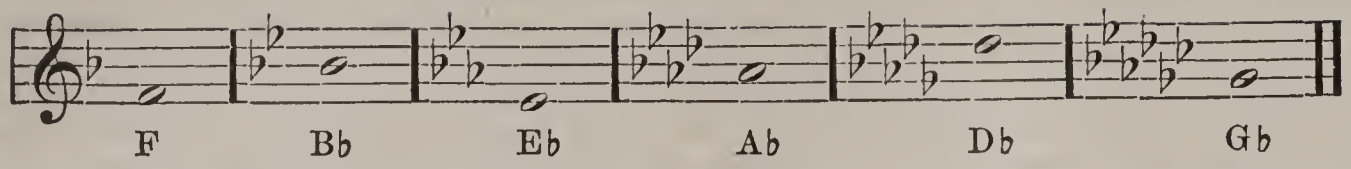


Each triad is composed of the key-note, its mediant, and dominant, and the scale of each key is composed of the triad of the key-note, with the triad immediately preceding and that immediately following it. Each key is succeeded by the key of its dominant, and if we begin with the key of C (in the middle of the scale), each key acquires an additional sharp until we reach the key of F♯ with six sharps. These are the sharp keys. If, beginning again with the key of C, we go back instead of forwards in the scale of triads, we obtain the flat keys; each key has an additional flat to that above it, till we come down to the key of G♭ with six flats. This key in instruments with temperament is exactly the same with that of F♯, and on this account it is not generally found convenient to extend the keys beyond six, or at most seven, sharps or flats. C♯ with seven sharps is the same as D♭ with five flats, and C♭ with seven flats is the same as B with five sharps. In music written in these keys, double sharps and double flats occur, which are indicated by the characters × and ♭♭ respectively. In writing music in any key with sharps or flats, it is usual, instead of prefixing the sharp or flat to each note when required, to place the sharps and flats belonging to the key together after the clef, on the degree to which they belong, and such collections of sharps or flats are called the signature.

SIGNATURES OF THE SHARP KEYS.



SIGNATURES OF THE FLAT KEYS.



A sharp or flat introduced in a composition which does not appear in the signature, is prefixed to the note, and called an accidental.

The diatonic scale and keys above described belong to what is called the major mode; there is also another mode in use called the minor mode. In the minor, as in the major mode, the diatonic scale and the keys are based on the scale of triads. Each of the triads already considered consists of two unequal intervals, called a major third and minor third. Supposing we begin with the minor instead of the major third, we have a succession of chords taking their minor third from one triad and their major third from another. These compound chords are called minor triads. Their proportion is as 10, 12, 15, and out of three such consecutive minor triads the scale of the minor mode is constructed.

Ḋ F Ȧ C Ė G Ḃ
80, 96, 120, 144, 180, 216, 270

Multiplying D and F by 2, and dividing B by 2, to bring the whole within the compass of an octave, we have:

A B C D E F G A
120, 135, 144, 160, 180, 192, 216, 240.

The scale here represented is what is known as the descending scale of the minor mode. When the seventh of the scale ascends to the eighth, it becomes sharp, as the proper leading note or sharp seventh to the tonic. This sharp is, however, always omitted from the signature, and placed accidentally before the seventh which it is to elevate. In order to avoid the harsh interval of the augmented second (from F to G♯), it is usual in the ascending scale to make the sixth sharp also, in order to accommodate the seventh; thus the ascending or accidental scale of the minor mode has two notes altered from the signature.

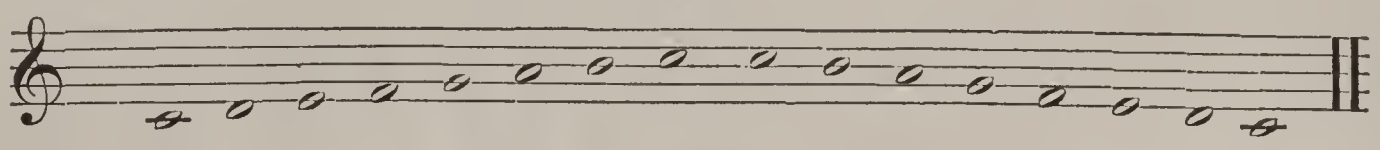
ASCENDING SCALE. DESCENDING SCALE.

Each minor scale is called the relative minor to the major scale on its right hand in the scale of triads, with which it has the same signature: thus the relative minor scale to C major is that of A minor.

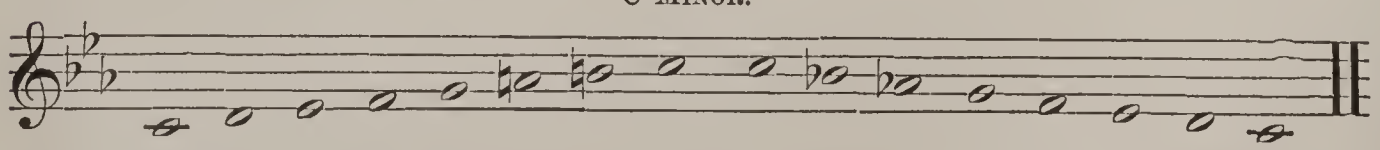
C major Ḟ A Ċ E Ġ B Ḋ
A minor Ḋ F Ȧ C Ė G Ḃ

Each minor scale is also called the tonic minor to the major scale on the same key-note, from which it differs in flattening the third of its tonic, and in the descending scale also the third of its subdominant and dominant. The tonic minor scale to C major is C minor.

C MAJOR.

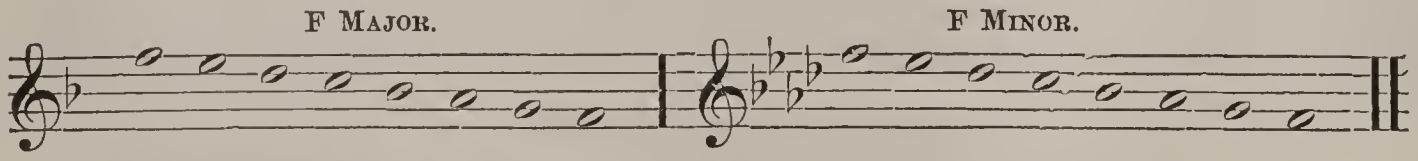


C MINOR.

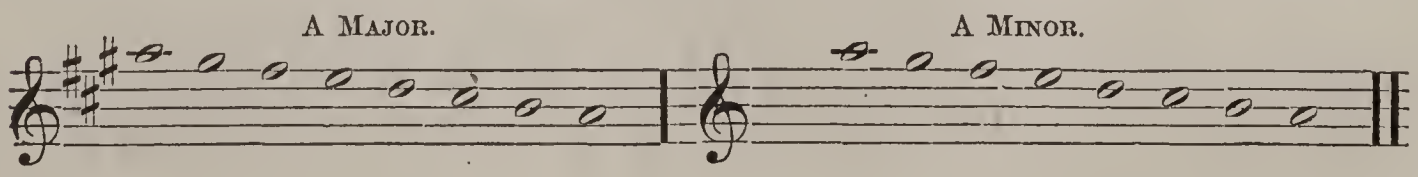


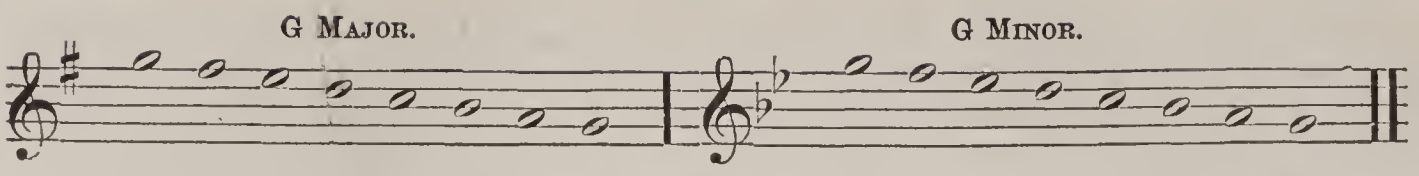
As the descending scale regulates the signature, each tonic minor has three flats more or three sharps less in its signature than its tonic major.

F MAJOR. F MINOR.



A MAJOR. A MINOR.

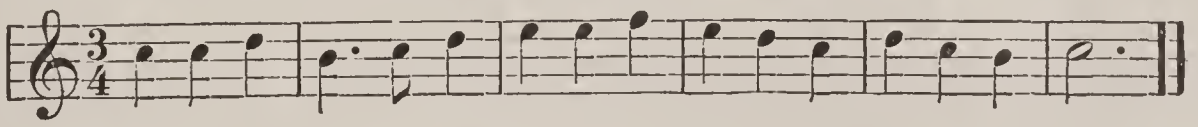




In this last example, F♯, B♮, and E♮ are all considered sharps in contrast with F♮, B♭, and E♭ of the minor scale.

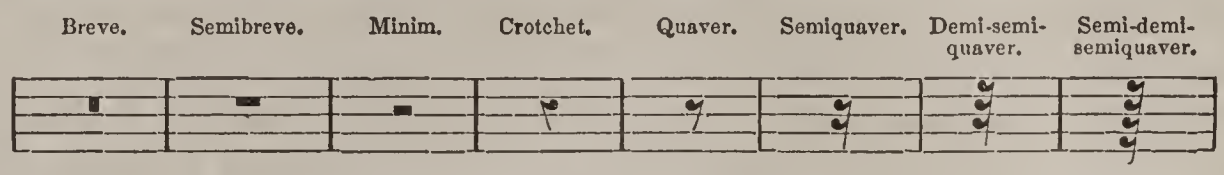
Rhythm.—In musical notation the relative duration of notes is indicated by their form. Notes may be open or close; they may consist of a head only, or of a head and stem. Where there is a stem, it may be turned up or down, according to convenience. The semibreve, the longest note in ordinary music, is open, and consists of a head only (𝅝). The minim is an open note with a stem, half the length of a semibreve 𝅗𝅥; the crotchet is a close note with a stem, half the length of a minim ♩; the quaver is a close note with a stem and hook, half the length of a crotchet ♪; a quaver is further divided into two semiquavers with two hooks 𝅘𝅥𝅯; four demi-semiquavers with three hooks 𝅘𝅥𝅰; and eight semi-demi-semiquavers with four hooks 𝅘𝅥𝅱. In slow religious music, an open square note, called a breve 𝅜, sometimes occurs. The semibreve is equivalent in time to two minims, four crotchets, eight quavers, sixteen semiquavers, thirty-two demi-semiquavers, and sixty-four semi-demi-semiquavers. The notes formed with hooks may be grouped together  . In vocal music this is not done except when a group is to be sung to one syllable. When a dot is placed after a note ♩. it is lengthened by one-half; when two dots, ♩.. it is lengthened by three-fourths.

Every piece of music is divided into portions equal in time, called measures, which are separated from each other by vertical lines called bars. The term bar is often loosely used to denote the measure as well as the line. The exact length of the measure is indicated by a sign at the beginning of the movement. In common time, indicated by the sign C each measure includes a semibreve, or its equivalent made up in notes of lower value:  All other measures of time have for their signatures two figures placed as a fraction, one over the other. The figures of the denominator are either 2, 4, 8, or 16, which stand for minims, crotchets, quavers, and semiquavers respectively (i.e., halves, fourths, etc., of a semibreve); the numerator indicates the number of these fractional parts of a semibreve contained in each measure. There is another form of common time besides that already noticed, which is called half-time, has a minim or two crotchets in the measure, and is known by the signature $\frac{2}{4}$ i.e., two crotchets—three minims, crotchets, or quavers in a measure, the piece  is said to be in triple time, its signature being $\frac{3}{2}$ $\frac{3}{4}$ or $\frac{3}{8}$.



When two or four measures of triple time are united in one measure, the movement is said to be in compound common time. Its usual forms are indicated by the signatures $\frac{6}{4}$ and $\frac{6}{8}$ In the first, there are three submeasures of three crotchets; in the second, two submeasures of three quavers  Compound triple time occurs where there are nine notes in a measure, either crotchets, quavers, or semiquavers, grouped in threes. Its signatures are $\frac{9}{4}$ $\frac{9}{8}$ and $\frac{9}{16}$ A variety occasionally occurs in simple or triple time by the measure note being divided into three, or even five or seven, instead of two parts, which are grouped together, sometimes with the figure 3, 5, or 7, placed above them. 
The object of the division of musical passages into measures is to indicate their rhythm, a quality forming an essential element in the pleasure derived from music. Notes of music, like words or syllables, are accented or unaccented. The principal accent is given to the first note of a measure. Of the four measure notes in common time, the third has also a subordinate accent, as has the third measure note in triple time. There are occasions when a strong accent, or emphasis as it is called, is laid on the part of the measure which is usually unaccented; this the composer indicates by the Italian terms *rinforzando*, *sforzato*, abbreviated *rinf.*, *sf.*

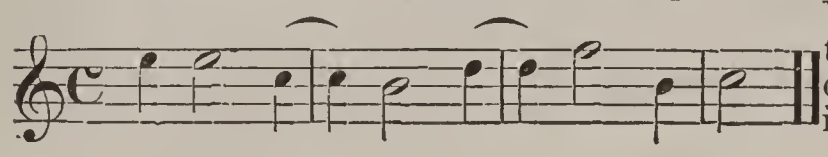
When in the course of a movement silence is required for a time, this is indicated by a rest or rests corresponding to that time; the breve, semibreve, minim, etc., have each their respective rests, which are represented as follows:



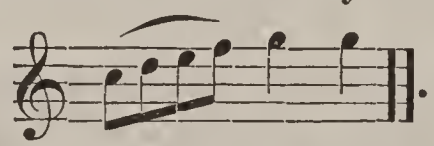
A rest may, like a note, be dotted to indicate the addition of half to its length.

The double bar consists of two strong vertical lines, placed at the end of a musical composition, and also at other parts (not necessarily coincident with the end of a measure) where a strain or rhetorical division of a movement terminates. When dotted on one side, all the measures on the side with the dots are to be repeated from the beginning, or from the antecedent double bar.

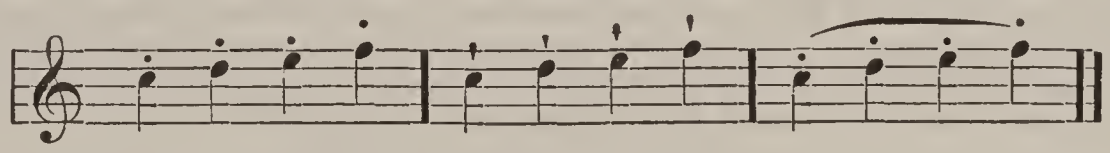
A tie is an arch placed between two notes on the same degree, to indicate that instead of the two notes written, one note is to be played of the length of both. When the last note of one measure is thus connected with the first of the next measure, the former, though naturally the unaccented note, acquires the emphasis—



When the same arch is drawn over two or more notes not in the same degree, it is called a slur, and merely indicates that they are to be played smoothly or fluently (*legato*)

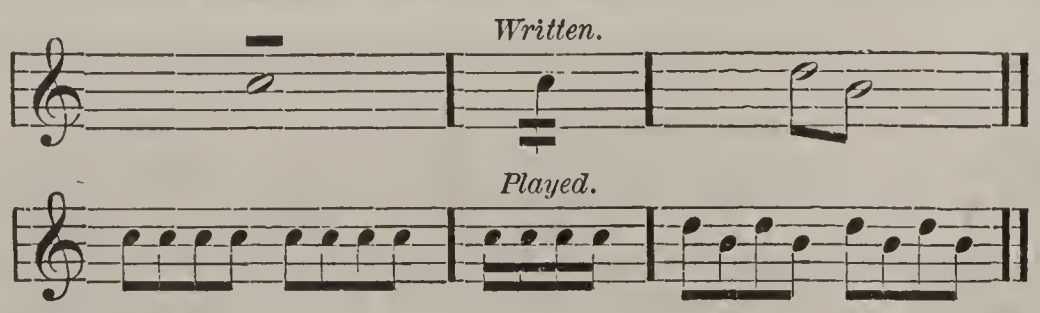


When notes are to be played short, distinct, and detached (*staccato*), a dot is placed over them. A dash implies a greater, and the union of dot and slur a less degree of staccato—



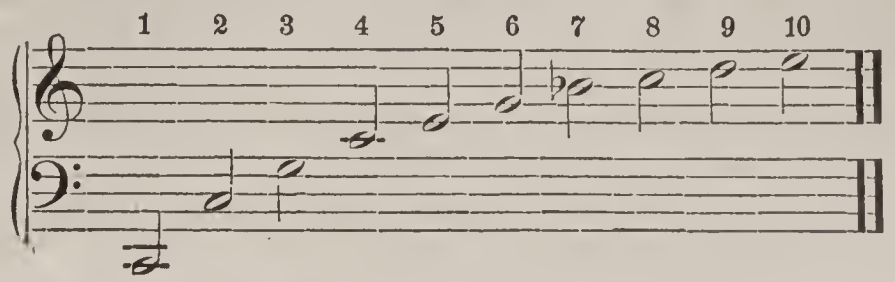
The pause placed over a note indicates a delay in the time of the movement, and a continuance of the sound made on that part of the measure.

The various degrees of softness and loudness which occur in a piece of music are indicated by the letter *f* for *forte*, loud; *p* for *piano*, soft, also *pp* for *pianissimo*, very soft; *mf* for *mezzo forte*, rather loud, and *ff* for *fortissimo*, very loud. A gradual increase of loudness is denoted by the word *crescendo*, or the sign <; and a diminution from loud to soft by the word *diminuendo*, or the contrary sign >. Many other expressions are used in the body of written music, indicating slowness, quickness, and the character of execution. The most important of them are explained under separate articles—as are the various musical graces or embellishments known under the names of the appoggiatura, beat, shake, and turn. Among abbreviations in frequent use are a line drawn over or under a semibreve, or through the stem of a minim or crotchet, to divide it into quavers; or a double line, to divide it into semiquavers. Two minims may be connected to indicate their repetition as quavers. Thus—



Harmony.—We have mentioned that when a string is struck, its harmonics are more or less distinctly heard along with it. This arises from the string spontaneously dividing itself into aliquot parts—as one-half, one-third, one-fourth, one-fifth, one-sixth, one-seventh, etc., of the string. The numbers 2, 3, 4, 5, 6, 7, expressing the relative number of

vibrations in a given time, are a measure of the pitch of the note, and placed proportionally to one another, or in the form of a fraction, they are a measure of the interval. The prime numbers 2, 3, 5, and 7, and their compounds, constitute the harmonics of a musical sound; no division by a higher prime number is tolerable to the ear along with the fundamental note, and no sound corresponding to such division is audible in the vibrations of a string—

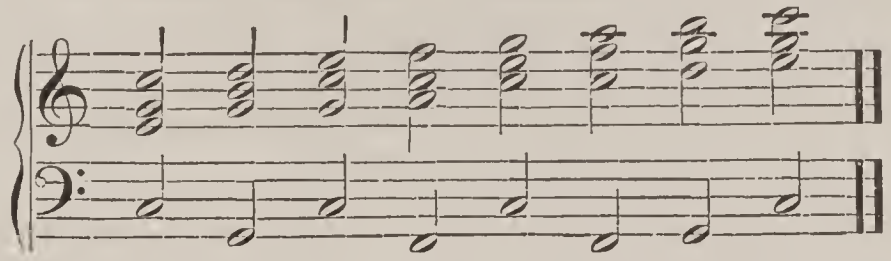


The degrees of the harmonic scale consist of intervals decreasing in a geometrical ratio from the octave to the minor tone, viz.:

1 : 2 Octave.	6 : 7 Grave third.
2 : 3 Fifth.	7 : 8 Tone maximus.
3 : 4 Fourth.	8 : 9 Tone major.
4 : 5 Major third.	9 : 10 Tone minor.
5 : 6 Minor third.	

Other intervals more or less consonant are to be found in the harmonic scale, of which the most important is 4 : 7, the grave seventh. From this scale is derived the triad, which we have seen to be the foundation of the diatonic scale, and also the whole theory of chords.

The first five notes of the harmonic scale are the component parts of the major common chord, by far the most consonant chord that can be produced by five notes. Neglecting octaves, its essential notes are the major triad, C E G, or 4, 5, 6, which, as already seen, consists of a fifth divided harmonically into major third and minor third. The root on which a chord is formed, or the note by whose division into aliquot parts the notes of the chord are produced, is called its fundamental bass, and the fundamental bass of the triad C E G is C. The common chord is the triad with the addition of the octave of the root; its proportions are 4, 5, 6, 8. Every key contains within itself two other triads besides that of the key-note—viz., those of the subdominant and dominant, which have the subdominant and dominant of the key-note respectively for their fundamental bases; and the feeling of satisfaction produced by the diatonic scale arises out of the fact that its notes belong to a progression of chords formed on a fundamental bass suggested by the ear. This fundamental bass is here indicated on the lower staff—



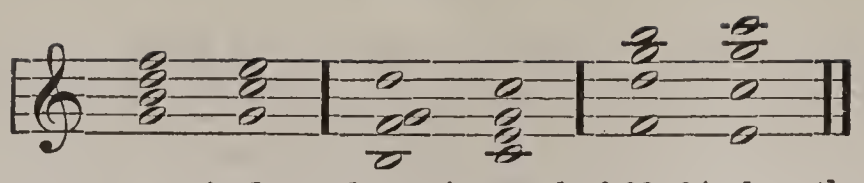
The relative position of the notes of a chord, and consequently its intervals, may be altered by raising one or more of them an octave; and, on the whole, the nearer the intervals approach to their position in the harmonic scale, the purer is their harmony. Close, in contradistinction to dispersed harmony, is when the notes of a chord are so near that no component note could be placed between them. When the fundamental bass of a chord ceases to be its lowest note, the chord is said to be inverted. Thus

and are inversions of the common chord, but not  ,

where the fundamental bass is still the lowest note.

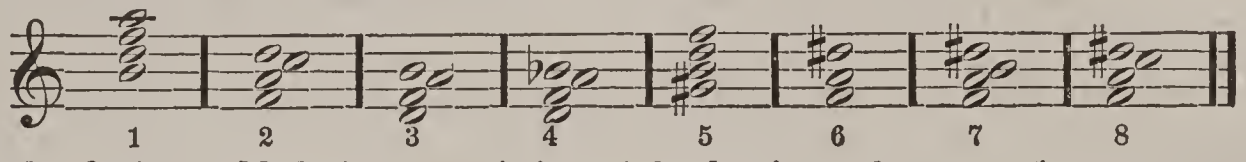
The minor triad is, as we have seen, a compound chord, whose ratio is 20, 24, 30, taking its minor third from the triad below, and its major third from the triad above. Its fundamental bass is the key-note. The minor mode has, like the major, three triads in each key—those of the tonic, subdominant, and dominant; and the minor common chord admits of the same inversions as the major, by making the third or fifth the lowest note.

The first seven notes of the harmonic scale contain the chord next in consonance to the common chord, the chord of the seventh or dominant harmony. Rejecting octaves, it is the harmonic triad with the addition of the grave seventh, 4, 5, 6, 7, C E G B♭, or G B D F, and admits of three inversions, according as the third, fifth, or seventh is taken instead of the root as the lowest note. This chord belongs to the key of which its fundamental note is the dominant; and in order to satisfy the ear, it requires to be followed by a resolution into the common chord of the key, or one of its inversions, the major third rising a semitone to the key-note, and the seventh descending one degree—



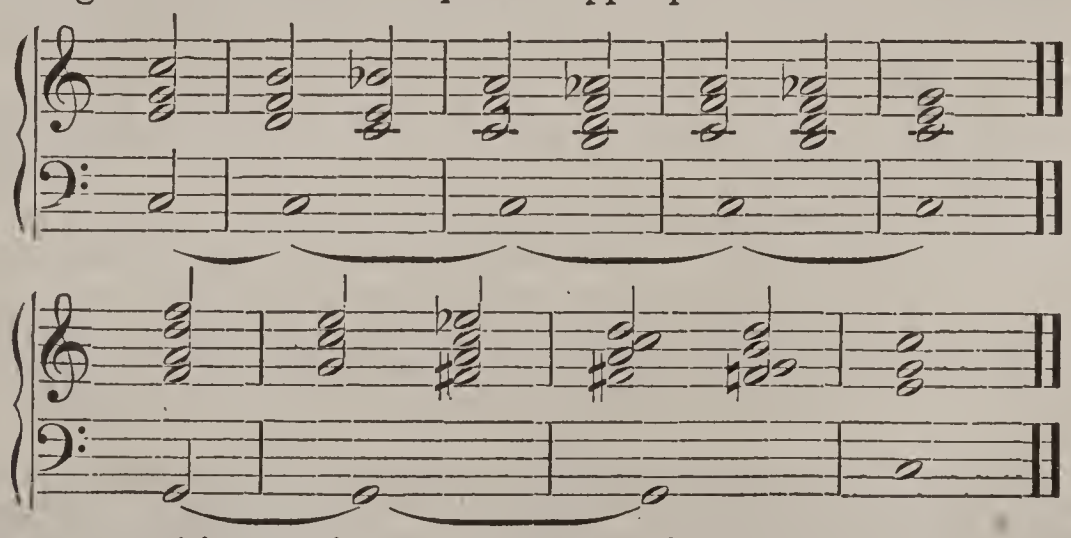
The dominant seventh note is flatter by an interval of 63, 64, than the subdominant of the key, though the two are not distinguishable on keyed instruments. The chord of the dominant seventh is the same in the tonic minor as in the major mode, but differs in its resolution, in respect that it descends a tone instead of a semitone 
The dominant harmony affords numerous means of modulating from one key to another. For example, the addition of a dominant seventh to the common chord of a key, effects a modulation into the key of the subdominant  In modulating into the key of the dominant, the supertonic bears the dominant harmony, and becomes dominant of the new key  For other modulations, we must refer to works on the theory of music.

The following more complex harmonies are also in general use—



1, the chord of the added ninth, consisting of the dominant harmony (its root generally omitted) with the fifth of the adjacent triad above; 2, 3, and 4, the different forms of the added sixth, or chord of the subdominant; 2 is the triad of the subdominant, with the third of the adjacent triad below, or rather its octave; 3 is the triad of the subdominant, minor mode, with the third of the adjacent triad below; and 4, the same triad with the third of the tonic major to the adjacent triad below; 5, the diminished seventh, a compound of the characteristic notes (B F) of the dominant harmony of the major mode with those (G♯ D) of the relative minor; 6, 7, and 8, the augmented sixths, all dominant harmonies, resolving into the major tonic; 6, called the Italian sixth (F A D♯), is a compound of the characteristic notes (A D♯) of the dominant harmony of the minor mode (B D♯ F A) inverted, with the dominant seventh note (F) of the major triad (C E G) below for a bass; 7, the French sixth (F A B D♯), the same as the last, with the addition of the octave to the fundamental bass; 8, the German sixth (F A C D♯), compounded of the characteristic notes of the dominant harmony of the minor mode inverted, with the dominant sevenths of the major triads below and above.

All classical harmonies can be reduced to the chords enumerated, varied by inversions, omissions, suspensions, and pedal basses. A pedal bass or organ point is a bass note sustained through a progression of chords, to only the first and last of which it is the proper bass. The pedal bass of the tonic is often used with the chord of the dominant seventh, the added ninth, and the diminished seventh, and occasionally with other chords: sometimes the pedal harmonies are taken on the dominant instead of the tonic, and the holding note sometimes occupies an upper part instead of the bass—

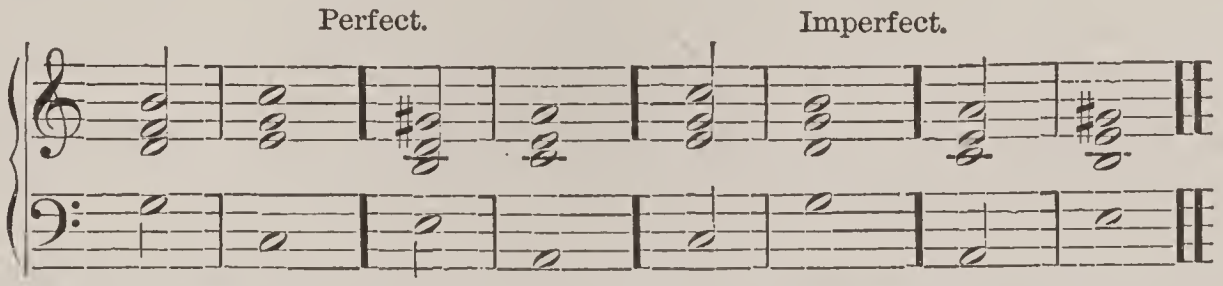


A musical composition consists of a succession of notes or of chords subject to certain laws. Like discourse, music has its phrases, periods, and punctuation. When a piece of music continues in the same key, it is said to move by progression, a term used in contradistinction to modulation, where the key is changed. Progression in music of two parts is of three kinds—oblique, when one part repeats or holds on the same note, while the other moves up and down; direct, where both parts move in the same way; and

contrary, where one moves up, and the other down. Consecutive chords should in general be connected, either as having some note in common, or as being the chords of closely connected keys. There are certain chords which require a special resolution—i.e., they must be followed by certain other chords; and there are certain progressions which, from harshness, are in ordinary cases to be avoided, more particularly consecutive fifths and consecutive octaves, the latter, however, being admissible when used merely to strengthen a part. Modulation is generally effected by introducing the chords common to both keys, and the secret of good modulation consists in the skillful choice of intermediate chords. Every regular piece of music is composed in a particular key, in which it begins and ends, and which predominates over all the other keys into which it has modulated. The keys into which a key most readily modulates are those most nearly related to it—viz., the dominant, the subdominant, and the relative and tonic major or minor. We have seen how modulation may take place by introducing the dominant harmony of the new key or one of its inversions, and in this way the entire harmonic circle of the keys can be made, either by ascending or descending fifths; but in order to effect this change, it will be necessary, on reaching the key of C♯ with seven sharps, to substitute, by what is called an enharmonic (q.v.) change, D♭ with five flats, or *vice versâ*, which on instruments with temperament produces no real change on the pitch, but merely on the names of the notes.

The arrangement of chords which the ear naturally expects at the close of a strain is called a cadence; it corresponds in music to the period which closes a sentence in discourse. It is perfect when the harmony of the dominant precedes the harmony of the key-note, and imperfect when the harmony of the key-note precedes that of the dominant without its seventh.

The imperfect cadence is the most usual termination of a musical phrase, or short succession of measures containing no perfect musical idea. A portion of melody formed of two regular phrases, and containing a perfect musical idea, is called a section, and its regular termination is the perfect cadence.



Music is produced by the human voice, and by a variety of artificial instruments. For the application of the voice to musical purposes, see Singing. Musical instruments are classified as stringed instruments, wind instruments, and instruments of percussion. In some stringed instruments as the pianoforte, the sounds are produced by striking the strings by keys; in others, as the harp and guitar, by drawing them from the position of rest. In a third class, including the violin, viola, violoncello, and double bass, the strings are put into vibration with a bow. In wind instruments the sound is produced by the agitation of an inclosed column of air; some, as the flute, clarionet, oboe, bassoon, flageolet, instruments of wood, and the trumpet, horn, cornet-a-piston, etc., of metal, are played by the breath; in others, as the organ, harmonium, and concertina, the wind is produced by other means. In the two last-named instruments, the sound is produced by the action of wind on free vibrating springs or reeds. Instruments of percussion are such as the drum, kettle-drum, cymbals, etc. The chief peculiarities of the more important musical instruments are noticed in special articles.

Musical compositions are either for the voice, with or without instrumental accompaniment, or for instruments only. Of vocal music, the principal forms may be classed as church music, chamber music, dramatic music, and popular or national music. The first includes plain song, faux-bourdon, the chorale, the anthem, the sacred cantata, the mass and requiem of the Roman Catholic church, and the oratorio. Vocal chamber music includes cantatas, madrigals, and their modern successors, glees, as also recitatives, arias, duets, trios, quartets, choruses, and generally all forms, accompanied or unaccompanied, which are chiefly intended for small circles. Dramatic music comprehends music united with scenic representation in a variety of ways, in the ballet, the melodrama, the vaudeville, and the opera, in which last, music supplies the place of spoken dialogue. Instrumental music may be composed for one or for more instruments. The rondo, the concerto, the sonata, and the fantasia generally belong to the former class; to the latter, symphonies and overtures for an orchestra, and instrumental chamber music, including duets, trios, quartets, and other compositions for several instruments, where each takes the lead in turn, the other parts being accompaniments. These and other forms of composition will be found noticed separately.

History of Music.—A certain sort of music seems to have existed in all countries and at all times. Even instrumental music is of a very early date: representations of musical instruments occur on the Egyptian obelisks and tombs. The music of the Hebrews is supposed to have had a defined rhythm and melody. The Greeks numbered music among the sciences, and studied the mathematical proportions of sounds. Their music,

however, was but poetry sung, a sort of musical recitation or intoning, in which the melodic part was a mere accessory. The Romans borrowed their music from the Etruscans and Greeks, and had both stringed instruments and wind instruments.

The music of modern Europe is a new art, with which nothing analogous seems to have existed among the nations of antiquity. The early music of the Christian church was probably in part of Greek, and in part of Hebrew origin. The chorale was at first sung in octaves and unisons. St. Ambrose and Gregory the great directed their attention to its improvement, and under them some sort of harmony or counterpoint seems to have found its way into the service of the church. Further advances were made by Guido of Arezzo, to whom notation by lines and spaces is due, but the ecclesiastical music had still an uncertain tonality and an uncertain rhythm. Franco of Cologne, in the 13th c., first indicated the duration of notes by diversity of form. The invention of the organ, and its use in accompanying the chorale, had a large share in the development of harmony. Along with the music of the church, and independently of it, a secular music was making gradual advances, guided more by the ear than by science; it seems to have had a more decided rhythm, though not indicated as yet by bars. The airs which have become national in different countries were developments of it, but it had its chief seat in Belgic Gaul; and the reconciliation of musical science with musical art begun in Flanders by Josquin Duprès in the 15th c., was completed in the 17th c. by Palestrina and his school at Rome, and reacted eventually on the ecclesiastical style. The opera, which appeared nearly contemporaneously with the Reformation and revival of letters, greatly enlarged the domain of music. Italy advanced in melody, and Germany in harmony. Instrumental music occupied a more and more prominent place. Corelli's compositions exalted the violin. Lulli and Rameau, with their ballet-like music, seized the characteristics of French taste, till the German Glück drove them out of the field. The scientific and majestic fugue reached its highest perfection under J. S. Bach. The changes introdueed in ecclesiastical music in England at the restoration gave birth to the school of Purcell; and a little later England adopted the German Handel, who was the precursor of Haydn, Mozart, Beethoven, Spohr, and Mendelssohn. The principal fact in recent musical history is the movement with which the name of Wagner is connected, having for its aim the production and perfeetion of a true musical drama, in which, unlike the opera, the words and music shall be of equal importance.

See Pepusch's *Treatise on Harmony*, Calcott's *Musical Grammar*, Hawkins's and Burney's *History of Music*, Marx's *Allgemeine Schule de Musik*, Brown's *Elements of Musical Science*, and Chambers's *Information for the People*, Nos. 96–97 (1875).

MUSIC (*ante*). The history of music in the United States had its origin in the quaint and primitive psalm-singing of the Puritans, and until 1825, when Italian opera was first given in this country, church music was cultivated to the exclusion of all other styles. It appears that Ainsworth's version of the Psalms was brought over by the Pilgrim Fathers who landed on Plymouth rock; and remained in use till 1693, when the *Bay Psalm-Book* was generally adopted. This latter version was printed in 1640 in Cambridge, Mass., with the title *The New England Version of the Bay Psalm-Book*, and was the first important publication of its kind in America. Although it had been compiled by an association of New England ministers, and approved by the churches, it met with great opposition, as many congregations looked upon the old version as a legacy intrusted to them by their forefathers. Among other scruples of conscience were, whether the singing of the Psalms of David with a lively voice was proper in these New Testament days. This and other quibbles set the churches into a turmoil, which did not subside until the rev. John Cotton wrote a tract in answer to the objections, which was sent to all the churches. Nathaniel D. Gould states in his book on *Church Music in America* that "when this tract or circular was read, and their feelings were reconciled, other objections and queries arose, namely, whether it was proper for one to sing, and all the rest to join only in spirit, and saying amen, or for the whole congregation to sing. Whether women as well as men, or men alone, should sing; whether pagans (the unconverted), be permitted to sing with us, or church-members alone. Also, whether it be lawful to sing psalms in meter devised by man, and whether it be lawful to read the psalm to be sung, and whether proper to learn new tunes which were uninspired; for it appears that they had so long been accustomed to hear and sing the same few tunes that they had imbibed the idea that the tunes were inspired, and that *man's* melody was only a vain show of art." Previous to the year 1690 there were but eight or ten psalm-tunes, taken mostly from Ravenscroft's collection, and they were sung in rotation, without any regard to the subject of the preacher. About 1712 rev. John Tufts of Newbury published a book of twenty-eight tunes, with rules "that the tunes might be learned with the greatest ease and speed imaginable." When it was made known that some had acquired the art of learning a tune by note, without having heard it sung, "all were amazed, and still more astonished that all could finish a tune together." Rev. Thomas Walter of Roxbury, Mass., in 1721, edited the first book of music (except the few tunes attached to the *Bay Psalm-Book*), with the art of singing by note, with bars to divide the notes or measures, for the first time. The rev. Mr. Barnard of Marblehead published the psalms and hymns in verse, with fifty tunes at the end of the book. His work contained such tunes as Mear, Windsor, etc., in three parts, with one page of instructions. James Lyon of Philadel-

phia, in 1761, published a choice collection of psalm-tunes, hymns, and anthems, in two, three, and four parts, called *Urania*. Josiah Flagg of Boston, in 1764, published a collection of church-music, engraved by Paul Revere, containing 116 tunes, generally of rather a light character. In 1770, appeared in Boston, *The New England Psalm-Singer, or American Chorister, containing a number of psalm-tunes, anthems, and canons, composed by William Billings, a native of New England.* This book opened a new era in American church music. William Billings was the author of six books of music, which were nearly all original, and very popular in their day. He was a zealous patriot, and the words to which he set many tunes combined religion and patriotism. These melodies were sung in the tent by the soldiers as well as in the church, and did much toward exciting the spirit of liberty among the people. Among those who succeeded Billings in compiling and composing church-music were Andrew Law, Oliver Holden, Samuel Holyoke, Daniel Reed, William Little, Timothy Swan, George Lucas, Thomas Hastings, Lowell Mason, George James Webb, N. Gould, Henry E. Moore, William B. Bradbury, E. Ives, B. F. Baker, H. W. Greatorex, George Kingsley, L. O. Emerson, Charles Zeuner, H. K. Oliver, John Zundel, Albert W. Berg, Henry Stephen Cutler, William H. Walter, Henry Wilson, William A. King, D. F. Hodges, Richard Storrs Willis, S. P. Tuckerman, H. N. Johnson, H. C. Timm, A. F. Lejial, L. H. Southard, J. H. Wilcox, Joseph Mosenthal, John P. Morgan, A. Kreisemann, Dudley Buck, and many others. Of these, Thomas Hastings and Lowell Mason deserve special mention for their life-long exertion to spread musical knowledge in this country. Many of the hymns of Hastings have retained their place and popularity in Protestant collections. He published in 1822 *A Dissertation on Musical Taste*, which was widely read, and did much toward the improvement of musical culture. Under the influence of Lowell Mason vocal music received an extraordinary impulse in Boston, and throughout New England. Eminent teachers were introduced into the schools; the Boston Academy of Music was established; and music was prescribed as a regular branch of instruction in the schools of Boston, and subsequently throughout the entire country. His published works, particularly the *Carmina Sacra*, were very popular, and are still in circulation. Hastings and Mason were followed by many imitators who made numerous compilations of hymn-books, Sunday-school melodies, glee-books, etc., which were constantly issued, as they proved for many years the most profitable kind of musical publications. In connection with the subject of church-music the *Gospel Hymns* of P. P. Bliss and Ira D. Sankey should not be forgotten. They were introduced at the time of the Moody & Sankey revivals of 1875 and subsequent years, and were published in a cheap edition, which was sold by the million. Among the most popular were "Hold the Fort;" "Almost Persuaded;" "Pull For The Shore;" "What Shall The Harvest Be?" by P. P. Bliss; the "Ninety and Nine," by Ira D. Sankey; "I Need Thee Every Hour," by Robert Lowry; "What a Friend We Have In Jesus," by Charles C. Converse; and the "Sweet Bye-and-Bye," the words of which were written by S. Fillmore Bennett and the music composed by Joseph P. Webster some years before the *Gospel Hymns* were published. These hymns have been severely criticised for catering to an inferior order of musical taste; but they satisfied the popular craving for pleasing melodies, and were of unquestionable benefit to a certain class of people who afterward were led to the cultivation of higher styles of church-music. There is now (1881) a movement in New York to have the scholars of the various Sunday-schools who are musically inclined, meet in some large hall in their section of the city, one or two evenings a week, for the purpose of receiving competent instruction. They will be taught to read notes at sight, and be made familiar with a better class of sacred music. Sigismund Lasar has recently compiled a Congregational hymnal, with selections of the highest class, aiming at the improvement of public taste.

Many societies were founded at the beginning of this century for the cultivation of oratorios in cities like Boston, New York, Philadelphia, Baltimore, and Albany. Of these, the Boston Händel and Haydn society became the most prominent, and is to-day by many considered the leading organization of its kind in America. Between 1820–40 there were a number of oratorio societies in New York, such as the New York Sacred Musical Society; Euterpeon, etc., which produced *The Messiah; The Creation;* Mozart's requiem-masses, and the masterpieces of Haydn and Beethoven. At the present time nearly every large city of the United States has a similar organization; but opera has not made a permanent home in any one place. The first representation of Italian opera was given in New York in 1825, and the troupe included Garcia, and his daughter Malibran. Since then Ullmann, Maretzek, Strakosch, Carl Rosa, Mapleson, and other managers have brought over European artists to give a season of opera in New York and all the large cities. Among singers who have been heard in this country are: M. W. Balfe (1834); John Braham (1840); Jenny Lind (1850); Teresa Parodi (1850); Catherine Hayes (1851); Henrietta Sontag (1852); Marietta Alboni (1852); Grisi and Mario (1854); Adelaide Philipps (1855); Brignoli (1855); Henrietta Eben (1856); Carl Formes (1857); Pauline Colson (1858); Anna Bishop (1858); Adelina Patti (1859); Carlotta Patti (1861); and Parepa-Rosa (1866). Of operatic singers who have visited America in later years are: Christine Nilsson (1871); Pauline Lucca (1872); Campanini (1873); Capoul (1873); Ilma de Murska (1873); Tamberlick (1873); Maurel (1873); Emma Albani (1874); Teresa Titiens (1875); Wachtel (1875); Anna de Belocca (1876); Minnie Hauck (1876); Mme. Pappenheim (1876); and Etelka Gerster (1877). Of American opera-singers, Clara Louise

Kellogg and Annie Louise Cary have achieved considerable reputation; and Emma Albani and Minnie Hauck, though classed by some as foreign singers, were born in this country. English opera was given in this country as early as 1793, when an English troupe performed in Washington and Philadelphia. In 1818 the Phillips company came over, and in 1820 Davis established an opera company in New Orleans. In 1821 Mrs. Holman brought a company to New York. In 1832 came the Woods, and Dunn and Hudson's company. The Seguins came in 1838, and after them the Pyne and Harrison troupe, Madam Bishop, and the Richings opera-troupe. Since then many other companies have been formed; but none have done more for the artistic success of English opera than Clara Louise Kellogg. Among the numerous pianists who have performed in America are: Sigismond Thalberg (1856); Anton Rubinstein (1873); Hans von Bulow (1875); Annette Essipoff (1876); and Rafael Joseffy (1879). It would be difficult to quote the number of excellent American pianists: Louis Moreau Gottschalk, who was born in New Orleans in 1829, and played somewhat in the style of Chopin, was very much admired; and S. B. Mills is ranked as an excellent artist. There have also been a great number of violinists who have played in America—Henry Vieuxtemps (1843); Ole Bull (1844); Camillo Sivori (1846); Camilla Urso (1852); Heinrich Wieniawski (1872); Remenyi (1878); August Wilhelmj (1878). Carl Bergmann, Theodore Thomas, Dr. Leopold Damrosch, Harvey B. Dodworth, and P. S. Gilmore have won distinction as musical conductors. Theodore Thomas established symphony concerts in New York, and finally organized his orchestra which has made him famous in this country and in Europe. The New York philharmonic society, under his leadership, introduces the highest class of music. Among composers who have made a reputation are: Karl Anschütz, George Bristow, F. L. Ritter, Dudley Buck, S. P. Warren, U. C. Hill, Henry C. Watson, A. Bagioli, J. Eichberg, Joseph Mosenthal, Nathan Richardson, Carlo Bassini, Richard Hoffmann, S. B. Mills, G. W. Morgan, Albert W. Berg, H. H. Wollenhaupt, and many others. Although America has not produced a single genius like Beethoven, Chopin, or Verdi, there is one line of composition that has been cultivated with great success, disproving the statement that we are indebted to the foreign element of our population for the music we possess, for the songs that have become the most popular and are endeared to the hearts of our people were composed by Americans. Stephen C. Foster acquired the secret of translating the thoughts, feelings, and sympathies of every-day life into melody. The best-known of his songs is "Old Folks at Home," in which he hoped to rival "Home, Sweet Home," that has become the home-song of the world, and was written by an American author—John Howard Payne. Foster composed many songs which attained great popularity, such as "My Old Kentucky Home;" "Massa's in de Cold, Cold Ground;" "Old Dog Tray;" "Willie, We Have Missed You;" "Ellen Bayne;" "Oh, Susanna;" and "Uncle Ned." All his songs had great pathos and freshness; but "Come Where My Love Lies Dreaming" was his most artistic composition. L. O. Emerson composed "We Are Coming, Father Abraham;" "Out In The Cold." Among his popular sacred songs are: "Stand Up For Jesus;" "Jesus Loves Me;" and his tunes to "Rock of Ages," and "Guide Me, O Thou Great Jehovah," are favorites. George F. Root is the author of the "Battle Cry of Freedom;" "Tramp, Tramp, Tramp;" "Hazel Dell;" and "There's Music In The Air." Harrison Millard composed "Viva l'America," and "Flag of the Free." He is also the author of many ballads, such as "Waiting;" "Under the Daisies;" "When the Tide Comes In;" and "Don't be Sorrowful, Darling." Henry C. Work composed the war songs "Marching through Georgia;" "Kingdom Coming;" "Wake, Nicodemus;" "Grafted into the Army;" "Babylon is Fallen; and "Song of a Thousand Years." He also wrote "Come Home, Father," a temperance song, and "My Grandfather's Clock," which, although of inferior merit, have become very popular. H. P. Danks has composed a large number of songs, of which "Silver Threads among the Gold" is the best known. Septimus Winner, whose *nom de plume* is Alice Hawthorne, wrote "What is Home without a Mother?" "Listen to the Mocking-Bird;" "I've Sailed the Seas Over; or the Song of Enoch Arden," and many others. J. R. Thomas wrote "The Cottage by the Sea;" "Happy be thy Dreams;" "Some One to Love;" and "'Tis but a little Faded Flower." Mathias Keller, composer of the "American Hymn," wrote "Mother, Oh Sing me to Rest,' and "Thine Image," which were very popular in their day.

Theodore Thomas, in a recent magazine article on the "Musical Possibilities of America," states: "The Americans are certainly a music-loving people. At present the musical standard of the American public, taken as a whole, must be pronounced a low one, though we rightly claim for this country a high rank in cultivation. The greater part of the church-music is a sort of patch-work—a little piece from this composer, and another piece from that—put together by an amateur. This low standard of church-music is not owing to the want of competent organists, for we have many of ability; but rather to the fact that they are hampered in their attempts to introduce better music. Recent years have also given us composers of undoubted merit. It is generally acknowledged that we make the best pianos. Our organs are good, and our brass and reed instruments are of a superior quality. But the most noteworthy fact of all is that we are making the best violins. Some of the first living violinists claim that the violins made by George Gemünder are worthy to rank with those of the famous Italian makers, needing only age to prove their great excellence. It will be seen that we have in this country the

possibilities of a great musical future. We have the musical taste of the people for music, their strong desire to have the best, and their readiness to recognize what is best when it is presented to them. We have exceptional natural resources for the making of musical instruments. Nature has done her part of the work generously; it remains for us to do ours."

MUSICAL BOX, a case containing mechanism constructed in such a manner that music can be produced automatically. Machines for making mechanical music have been known since the invention of clocks; but real musical boxes were not introduced till after 1750. They have been greatly improved since then, and some of our modern musical-boxes can play over 100 tunes. The mechanism is similar to that of the barrel-organ. The principal parts are the comb, the cylinder, and the regulator. Bells, drums, and castanets are frequently added to produce musical effects, and in such cases the boxes are sometimes termed mandolins, expressives, quatuors, organocleides, piccolos, etc. When they have a combination of reeds and pipes they are known as flutes, celestial voices, and harmoniphones. Large quantities are exported annually of the musical clocks made in the Black Forest and the musical boxes of Prague, and Sainte Susanne in France. The best musical boxes, however, are manufactured at Geneva, Switzerland.

MUSIC RECORDER. Many forms of apparatus have been invented for writing down music in a legible form by the very act of playing it on a keyed instrument, such as the pianoforte or organ. Beginning with 1747, various attempts had been made practically to effect this object, when, in 1863, Mr. Fenby invented and patented his *phonograph* (quite distinct from Bell's phonograph, q.v.), in which he brought in the aid of electro-magnetism. His chief aim, as an improvement on previous apparatus, was to devise a method of denoting the length of the notes, as well as their pitch and the interval between them. On pressing down any key of the instrument, a stud on the under side touches a spring; the spring sets in action a small electro-magnetic apparatus, which causes a tracer to pass against a strip of paper moving onward at a uniform rate by means of a cylinder and clockwork. The paper is chemically prepared, so as to receive a brown stain whenever the tracer passes along its surface. The length of each note is expressed by horizontal dashes of greater or less length, made by the tracer; and the arrangement is such as to denote the lines of the stave as well as the character of the note. By subsidiary adjustments the apparatus is made to express accidental sharps and flats, changes of time, etc.

The abbé Moigno's *phonautograph*, introduced to the British association in 1860, is a contrivance—not for noting down sounds in any kind of musical notation—but for causing a vibrating surface to tell its number and character of vibrations. A kind of spheroidal drum is covered at one end with a diaphragm or stretched membrane; a sheet of paper is carried along this drum-head by means of clockwork; and a system of small levers moves a pen. A tuning-fork, an organ-pipe, or the voice is sounded in proximity to the drum, the body of air within which acts as a re-enforcement of the sound; the membrane vibrates in a manner which can be *felt* by the pen, although not seen by the eye; and the pen makes zigzag markings on the paper. When the sound is produced by a tuning-fork or an organ-pipe, the zigzag lines are so regular that they serve to count the number of vibrations belonging to each particular note. When the sound is that of a singing voice, the markings become very peculiar, especially in words containing the gutturals *r*, *g*, etc. For the more recent PHONOGRAPH, see under that head.

MUSK, or MUSK DEER, *Moschus moschatus*, a ruminant quadruped, the type of the family *moschidæ*. This family differs from *cervidæ* (deer) in the want of horns, and in the long canines of the males, projecting beyond the lips. The musk is an inhabitant of the elevated mountainous regions and table-lands of central Asia. The habits of the musk are very similar to those of the chamois. Its favorite haunts are the tops of pine-covered mountains, but its summer range extends far above the region of pines. Its habits are nocturnal and solitary, and it is extremely timid. It is much pursued by hunters on account of its odoriferous secretion, which has been known in Europe since the 8th c., and is much valued as a perfume. This secretion, *musk*, is produced in a glandular pouch situated in the hinder part of the abdomen of the males; and its natural use seems to be that of increasing sexual attractiveness. The musk-bag is formed by an infolding of a portion of the skin of the belly, within which a number of membranes are contained, and between these membranes are glands by which the musk is secreted. When newly taken from the animal, musk is soft and almost resembles an ointment; it is reddish-brown, and has an excessively powerful odor. Very little of it reaches Europe unadulterated.—Musk is usually imported either in the form of *grain-musk*, that is, the musk which has been collected chiefly from stones upon which it has been deposited by the animal, in which state it is a coarse powder of a dark-brown color; or in the *pod*, that is, in the musk-sack, which is cut altogether from the animal, and dried with the musk inside. Of both kinds the annual importations are about 15,000 ounces per annum, chiefly from China and India. Small quantities are used in medicine, but the greater portion is employed by the perfumers. It is imported in small boxes or catties, often covered with bright-colored silk, and each containing 25 pods. The kinds generally known in trade are the Tonquin or Chinese, which is worth two guineas an oz. in the pod, or £3

10*s.* per oz. in grain; and the Carbardine, Kabardine, or Siberian, which is always imported in pod, and is very inferior, being only worth about 15*s.* an ounce.

The flesh of the musk is sometimes eaten, but has a very strong flavor. The season of migration from the highest and coldest to more temperate regions, is that at which the musk is chiefly pursued.—No other animal of the family *moschidæ* yields the perfume called musk, or has more than a rudimentary musk-bag. The other species of *moschidæ* belong to the genus *tragulus*, and receive the popular name *chevrotain*. They have a very elongated muzzle; and the accessory hoofs assume the form of appressed conical claws. They inhabit the thick woody copses or jungles of the Indian islands, and are the smallest of ruminant quadrupeds. Some of them are not larger than a hare. Their tusks are not so long as those of the musk. One of them, the *napu* of Java and Sumatra, has the smallest blood corpuscles of any known animal.

MUSKALLONGE, or MUSKALLUNGE, the *esox estor* of the *esocidæ* or pike family. It inhabits the North American lakes and the St. Lawrence river. Its length is sometimes 50 inches, often weighing 60 pounds. They are caught, either with hook or net, ranging from a few pounds up to this excessive weight. See PIKE, *ante*.

MUSK DUCK, *Cairina moschata*, a species of duck, of the non-oceanic section of *anatidæ* (see DUCK); of a genus characterized by an elevated tubercle at the base of the bill, the edges of the mandibles sinuated, the face and lores covered with a bare tuberculated skin, the wings furnished with a knob or spur at the bend. The musk duck, or MUSCOVY DUCK—so called, however, through mistake, and receiving its name musk duck more appropriately from its musky smell—is a native of the warm parts of America. It is very plentiful in Guiana, in that part of the year when winter reigns in the north. It is a larger bird than the common duck, in its wild state almost black, with glosses of blue and green, and white wing-coverts, but varies considerably in domestication. It is often to be seen in poultry yards in Britain, but is rather curious than profitable. It hybridizes readily with the common duck, but the hybrid is sterile.—The musk duck of Australia is a very different species, belonging to the genus *biziura*.

MUSKE'GON, a co. in s.w. Michigan, along the shores of lake Michigan; 500 sq.m.; pop. '80, 26,586—17,391 of American birth. It is mostly rolling and fertile prairie, watered by the Muskegon and White rivers, and a number of smaller streams. The principal productions are corn, wheat, and oats, which are grown in nearly equal quantities. It contains a large number of saw-mills, besides carriage shops, metal-ware manufactories, machine shops, sash and blind manufactories, tanneries, and curriers' shops. It is on the line of the Chicago and West Michigan, and the Michigan Lake Shore railroads. Co. seat, Muskegon.

MUSKE'GON, a city in Muskegon co., Mich., on the Muskegon river, near lake Michigan; pop. '80, 11,262. It is on the line of the Lake Shore, the Grand River Valley, and the Muskegon and Big Rapids railroads, and has daily steam communication with Chicago. The preparation and shipment of lumber is the principal business. The transportation of the lumber employs a large number of vessels, and much is sent by rail. The logs float down the Muskegon river into lake Muskegon, which has an area of some 10 sq. miles. More than 300,000,000 ft. of lumber are annually shipped, and there are between 30 and 40 saw-mills. There are also saw manufactories, foundries, and sash and blind factories. There are 3 national banks.

MUSKET, or MUSQUET (Fr. *mousquet;* from *mouchet*, a sparrow-hawk; in the same way that other shooting-implements were named *falcon*, *falconet*, etc.), the fire-arm for infantry soldiers, which succeeded the clumsy arquebuse, and in 1851 gave way before the Enfield rifle, which, in its turn, was converted into Snider's patent breech-loading rifle, now known as the Snider-Enfield; the latter arm, so far as the regular infantry is concerned, has been replaced by the Martini-Henry breech-loader, but the navy, cavalry, and auxiliary forces still retain the Snider. The first muskets were matchlocks; after which came wheel-locks, asnaphans or snap-hance and flint muskets; and lastly, percussion muskets, which were a vast improvement, both for accuracy and lightness, on all which had gone before. Compared, however, to either the Enfield or Martini-Henry rifle, the musket familiarly known as Brown Bess (possibly a corruption of Ger. *büchse*, a hollow tube or gun) was a heavy, ugly, and ineffective weapon. The following is a table of the ranges attained, on an average, by the musket, the Enfield, and the Martini-Henry:

	Musket. Yds.	Enfield Rifle. Yds.	Martini-Henry Rifle. Yds.
Accurate fire	100	600	1200
Effective against detached parties	150	800	1500
Effective against troops in column	200	1000	1800

MUSKETOON', an obsolete weapon, was a short musket of very wide bore, carrying a ball of 5 oz., and sometimes bell-mouthed like a blunderbuss.

MUSK'ETRY, SCHOOLS OF. When the introduction of the Minié rifle in the French service, and the subsequent arming of the British troops with the still more delicate Enfield rifle in 1851, brought the accuracy of a soldier's fire to be an important consid-

eration in estimating his value (which with the old musket was not the case, as it was proverbial that the bullet never hit the point aimed at, however carefully), the English government at once saw the necessity of providing instruction in the manipulation of the rifle. Accordingly, instructors of musketry were attached to the troops, one to each regiment; and a school was established at Hythe in 1854, under the late gen. (then col.) Hay, where lessons on the theory of the arm, and practice in its actual employment, were the sole occupation of the day. Officers and promising men were sent there as fast as the accommodation permitted; and after a course of a few weeks were able to return to their corps, and became instructors to their comrades, so that the shooting of the whole army soon rose in a surprising degree. Whereas, before the establishment or this school, the English stood low in the scale of shooting, the competitions held during recent years at Wimbledon have demonstrated that no nation can now excel them as marksmen. The formation of the volunteer corps, in 1859, led to a greatly increased demand for musketry instruction, which the government met by forming a second school of musketry at Fleetwood (now abandoned), where the troops and volunteers of Scotland, Ireland, and the northern English counties found the necessary teaching. The Hythe school is superintended by a commandant and inspector-general of musketry instruction, with subordinate instructors. The inspector-general is responsible also for the instruction throughout the regiments all over the world, and to him the musketry returns from each regiment are sent annually.

MUSKING'UM, a co. in s.e. central Ohio; drained by the Licking and Muskingum rivers and several creeks; intersected by the Baltimore and Ohio, the Pittsburg, Cincinnati, and St. Louis, and the Muskingum Valley railroads; about 700 sq.m.; pop. '80, 49,780—46,582 of American birth. The surface is undulating, and the soil fertile; there are forests of valuable woodland; wheat, Indian corn, hay, and dairy products are the staples; coal, iron, and limestone are found. The Ohio canal passes through the county; and there are numerous factories of bricks, carriages, saddles and harness, woolen and cotton goods, etc. Co. seat, Zanesville.

MUSKING'UM RIVER, flowing s.e. through Ohio, and emptying into the Ohio river; formed by the junction of the Tuscarawas and Walhonding rivers. The entire length from Coshocton to Marietta is 115 m., and the stream passes through Muskingum, Morgan, and Washington counties, and is navigable as far as Dresden. The river furnishes water-power for many factories at Zanesville and Marietta and elsewhere.

MUSKOKA, an electoral district in Ontario, Canada; 5,300 sq.m.; pop. '81, 27,202. Capital, Bracebridge.

MUSK OX, *Bos moschatus*, or *Ovibos moschatus*, an animal of the family *bovidæ*, regarded as a connecting-link between oxen and sheep. It inhabits the most northern parts of America, enduring the winter even of Melville island and Banks' land; but, like many other animals, it is partially migratory, some individuals or herds seeking more southern regions and better pastures on the approach of winter, while some remain in the furthest north. It is not found in Greenland, Spitzbergen, or Siberia. The musk ox is scarcely equal in size to the smallest of Highland cattle, but appears larger from the profusion of long matted woolen hair with which it is covered, and which hangs almost to the ground. The head is covered with long hair as well as the body, the face alone having short hair. Beneath the long hair there is a thick coat of exquisitely fine wool. The head is large and broad; the forehead convex; the extremity of the muzzle hairy. The horns are very broad at the base, and in the male meet on the forehead; they do not rise but bend down on each side of the head, and curve outwards and upwards towards the tip, which tapers to a sharp point. They are about 2 ft. long measured along the curvature; and about 2 ft. in girth at the base; a pair of them sometimes weighing 60 pounds. The limbs are short, the legs have short hair. The tail is very short, and is covered with long hair, so that it is undistinguishable to the sight. The general color is brown. The female is smaller than the male, has shorter hair on the chest and throat, and smaller horns. The frog of the hoof is short and partially covered with hair; the foot-marks are very similar to those of the reindeer.

The musk ox feeds on grass, twigs, lichens, etc. It is fleet and active, very sure-footed on rocky ground, and ascends or descends very steeps hills with great ease. It is gregarious; the herds generally number 30 or 40. The powerful horns are excellent weapons of defense against wolves and bears, which are often not only repelled but killed. When musk oxen are assailed by firearms, however, they generally huddle more and more closely together, and do not even seek safety by flight, so long as the assailants are unseen. The flesh is much prized by the Esquimaux, but retains much of the strong musky odor which characterizes the living animal. The horns are used for various purposes; particularly the wide base for vessels. The fine wool has been spun and woven into a fabric softer than silk. No attempt has yet been made to domesticate the musk ox; which, however, seems worthy of it, and suitable for all cold regions.

MUSK PLANT, Musk Root, Musk Tree, Musk Wood. Different parts of a number of plants smell more or less strongly of musk. Among these are the common little musk plant (see Mimulus), the musk-tree of Van Diemen's land (see Aster), and the musk ochro (see Hibiscus).—The musk tree of Jamaica (*moschoxylum swartzii*) belongs to the

natural order *meliaceæ*. It emits from all parts a smell of musk.—All parts of *guarea grandifolia*, another tree of the same order, a native of the West Indies, sometimes called musk wood, also smells strongly of musk, but particularly the bark, which is used in perfumery.—The drug called MUSK ROOT or SAMBUL is brought from the east, and is the root of a plant supposed to be of the natural order *umbelliferæ;* but the plant is unknown, nor is it certain whether its native country is Persia, or some more remote region of central Asia. It has a pure musky odor, and is used as a substitute for musk.

MUSK RAT, or DESMAN (*mygale* or *galemys*), a genus of insectivorous quadrupeds of the shrew (q.v.) family (*sorecidæ*), differing from the true shrews (*sorex*) in having two very small teeth between the two large incisors of the lower jaw, and the upper incisors flattened and triangular. Behind these incisors are six or seven small teeth (lateral incisors or false canine teeth) and four jagged molars. The muzzle is elongated into a small flexible proboscis, which is constantly in motion. The eyes are very small; there are no external ears; the fur is long, straight, and divergent; the tail long, scaly, and flattened at the sides. All the feet have five toes, fully webbed; and the animals are entirely aquatic, inhabiting lakes and rivers, and making holes in the banks with the entrance from beneath the surface of the water. Only two species are known, one (*M.* or *G. pyrenaica*) about 8 in. long, with tail as long as the body, a native of the streams of the Pyrenees; another larger species (*M.* or *G. moschata*), very plentiful in the Volga and other rivers and lakes of the s. of Russia, nearly equal in size to the common hedgehog, with tail about three-fourths of the length of the body. The Russian desman is blaekish above, whitish beneath; it has long silky hair, with a softer felt beneath, and its fur is held in some esteem. Desman skins, however, are chiefly valued on account of the musky odor whieh they long exhale, and which is derived from a fatty secretion produced by small follicles under the tail of the animal. The desman feeds on leeches, aquatic larvæ, etc., searching for them in the mud by means of its flexible proboscis. It seldom, if ever, voluntarily leaves the water, except in the interior of its burrows, which are sometimes 20 ft. long.

MUSK RAT, *Sorex murinus*, an Indian species of shrew (q.v.), in size about equal to the common brown rat, in form and color much resembling the common shrew of Britain, but remarkable for the powerful musky odor of a secretion which proceeds from glands on its belly and flanks. This odor adheres most pertinaciously to any object with which the animal may come in contact, and provisions are often utterly spoiled by it. Even wine and beer are said to be spoiled by it, in spite of the glass and cork of the bottle, although the probability is much greater that it adheres to the outside of the bottle, and that the liquid is spoiled as it is poured out. One of the Indian names of this animal is *sondeli*

MUSK RAT. See MUSQUASH.

MUSLIN, a cotton fabric of oriental origin, is said to have derived its name from the town of Mosul, in Mespotamia, where this material was at one time very largely manufactured. At present no such trade exists there; and for muslins, of the common kinds at least, the Indian market depends upon the manufactures of England and France. But no European manufacturer has ever been able to rival the wonderfully fine muslins of Dacea. This does not arise so mueh from the fineness of the yarn, although that too is very great, but from the marvelous fineness conjoined with a most delicate softness to the touch. The fineness of the yarn is so great that until lately no machinery could produce anything like it; a piece of Dacca muslin, shown in the international exhibition (1862), was 31 ft. in length by 3 ft. in width, and contained in a square inch 104 warp threads and 100 weft threads, yet the entire piece weighed only 3½ ounces. A French manufacturer, M. Thivel Michon of Tavare, has made a muslin of English yarn spun by the Messrs. Houldsworth of Manchester, which surpassed the finest Dacca in the excessive thinness of the yarn, but it wanted its delicate softness. Muslin is much less compact in its texture than calico, indeed it more nearly resembles gauze in appearance; but it is woven plain, without any twisting of the weft threads with those of the warp. The manufacture of muslins in Great Britain and France is very extensive, especially printed muslins, in which the patterns are produced by the same processes as in calico-printing. See WEAVING.

MUSNUD, a Persian throne of state.

MUSOPHA'GIDÆ. See PLANTAIN-EATER.

MUS'PRATT, JAMES SHERIDAN, PH.D., 1821–71; b. Ireland; when a boy made a tour on the continent, and studied chemistry with prof. Graham of Glasgow. In 1838 he possessed sufficient knowledge of chemistry to take charge of the chemical department of a large Manchester manufactory. After an unsuccessful business experiment in America, he resolved to devote himself entirely to the study of chemistry, which he pursued under Liebig, at Giessen, 1843–45. There he published an edition of Plattner's *Treatise on the Blowpipe*, and took the degree of PH.D., with a thesis tracing the resemblance between the carbonates and sulphites. In 1847 he produced a number of new substances from the sulpho-cyanides of ethyl and methyl. On his return to England in 1848 he established and became superintendent of a college of chemistry at Liverpool. From 1854 to 1860 he was engaged on a dictionary of chemistry, which was also pub-

lished in this country and translated into French and German. His *Outlines of Quantitative Analysis for Students* has had a considerable circulation,

MUS'QUASH, Musk-rat, or Ondatra, *Fiber zibethicus,* a rodent quadruped, a native of North America, It is the only known species of the genus to which it belongs which is characterized by dentition similar to that of the voles; in some other characters more nearly agreeing with the beaver. The musquash is in shape nearly similar to the brown rat; the head and body are about 15 in. in length, the tail 10 inches. The whole body is covered with a short downy dark-brown fur, intermixed with longer and coarser hairs. It is common in almost all parts of North America, from lat. 30° to lat. 69°, except in the southern alluvial districts. It is a very aquatic animal, seldom wandering from the rivers, lakes, or marshes in which it makes its abode. The fur is in demand, and forms an article of commerce—skins in large number being still exported from America to Britain and other European countries. The musquash burrows in the banks of streams and ponds; the entrances of its burrows being always under water, so that it must dive to reach them. In marshes the musquash builds a kind of hut, collecting coarse grasses and mud, and raising the fabric from 2 to 4 ft. above the water. The flesh of the musquash, at those seasons when it is fat, is in some request among the American Indians, and is said to be not unpalatable.

MUSSEL, *Mytilus,* a genus of lamellibranchiate mollusks, the type of the family *mytilidæ,* which, however, is much more restricted than the Linnæan genus *mytilus.* The *mytilidæ* belong to the division of *lamellibranchiata,* called by Lamarck *dimyaria,* having two *adductor* muscles—muscles employed in closing the valves of the shell. The mantle has a distinct anal orifice; the foot is small; and there is a large *byssus* (q.v.), which is divided into fibers to its base. The valves of the shell are equal; the hinge is destitute of teeth. Some, but few, of the species are found in fresh water. See Dreissena. Some (*lithodomus*) burrow in stone. How they do it is utterly unknown, but they do burrow even in the hardest stone; and some small tropical species excavate for themselves holes in the shells of great limpets. The *lithodomi* are sometimes called *date-shells.* Some of them are very beautiful, which is the case also with the true mussels, after the epidermis is removed. Even the Common Mussel (*M. adulis*) then exhibits beautiful veins of blue. This species is very abundant on the British coasts, and is much used as bait by fishermen. It is gregarious, and is found in vast beds, closely crowded, adhering by the byssus to rocks, etc. These beds are usually uncovered at low water. The shell is oblong; at its greatest size about 3 in. long, and an inch and a half broad. Mussels, when young, move about by means of the foot, with which they lay hold of objects and drag themselves along, until they find some suitable spot to anchor themselves by a byssus. If detached, they soon find another anchorage. In an aquarium they readily attach their byssus-threads even to the smooth glass, and the threads may be broken more easily than separated from the glass. An ingenious and important application of the strength of these threads has been made by the French, to render Cherbourg breakwater more secure by binding the loose stones together, for which purpose it was *planted* with tons of mussels. The common mussel is much used as an article of food, and is generally found quite wholesome; yet it sometimes proves poisonous, particularly in spring and summer, either causing blotches, swellings, and an eruption, accompanied with asthma, or a kind of paralysis, and even sometimes producing delirium and death. For the Fresh-water Mussel, see that article.

MUS'SELBURGH, a small sea-port and royal and parliamentary burgh of Scotland, in the county of Edinburgh, is situated at the mouth of the Esk, 6 m. e. of Edinburgh. On the west side of the Esk is the fishing village of Fisherrow. Tanning, leather-dressing, and the manufacture of sail-cloth, nets, and salt are carried on. The harbor at Fisherrow is frequented by coasting craft, and by small vessels from Holland and the Baltic. Timber, oil-cake, bark, seeds, and hides are imported; coal is the chief export. On the "links," a famous golfing ground, the Edinburgh races take place annually. Musselburgh unites with Leith and Portobello in sending a member to parliament. Pop. '81, 7,865.

MUSSET, Louis Charles Alfred de, one of the foremost of recent French poets, was b. at Paris Nov. 11, 1810. He studied in succession medicine, law, finance, and painting; but finally, under the influence of the romantic school (q.v.), devoted himself to poetry. The first work that attracted notice was *Les Contes d'Espagne et d'Italie* (1830), which by their elegant but audacious sensuousness gave deep offense. *Le Spectacle dans un Fanteuil* (1832) is a strange medley of contrasts. *Les Nuits* (1840) admittedly show his lyrical power at its best. Many of the *Comédies et Proverbs* were popular on the stage; and Musset wrote several prose romances. In 1852 he was admitted to the French academy. He died at Paris May 2, 1857. The exquisite beauty, tenderness, and power of much of Musset's work is continually marred by the morbid pessimism of a man prematurely old, disillusioned, *blasé;* on this very ground Musset is often regarded as the representative poet of the modern Parisian

MUSSEY, Reuben Dimond, an American surgeon; b. N. H., 1780; d. Boston, 1866; graduated at Dartmouth, 1803; Philadelphia 1809; practiced medicine and surgery at Salem 1809–14; professor of practice of medicine at Dartmouth 1814–19, and of anatomy and surgery from the latter date to 1838, when he removed to Cincinnati and

became professor of surgery in the Cincinnati college of medicine and surgery, occupying the chair till 1852, when he was appointed professor of surgery in the Miami medical college, where he remained till 1860, when he removed to Boston. He was a bold and successful operator, and was the first to ligate both common carotid arteries, an operation which was successful in its results.

MUSSEY, William H., M.D. See page 887.

MUSSULMÁN, *Mosleman*, a Mohammedan (from Arab. *Salama*), equivalent to Moslem, of which word it is, properly speaking, the plural; used in Persian fashion for the singular. We need hardly add that this Arabic plural termination of "án" has nothing whatever to do with our word *man*, and that a further English plural in *men* is both barbarous and absurd.

MUSTANG. See Horse.

MUSTARD, *Sinapis*, a genus of plants of the natural order *cruciferæ*, having yellow flowers, and linear or oblong pods, which terminate in a sword-shaped and compressed or 4-cornered beak, and contain one row of seeds. The seeds are globular, and their cotyledons (q.v.) conduplicate.—The most important species is Black Mustard (*S. nigra*), an annual, which grows wild in fields and by waysides in the middle and south of Europe, and is not uncommon in the southern parts of Britain. Its pods are bluntly 4-angled, smooth, erect, and lie close to the stem, their valves 1-nerved; the leaves are smooth, the lower leaves lyrate, the upper leave linear-lanceolate. The seeds are brownish black.—White Mustard (*S. alba*), also a native of most parts of Europe, and of the southern parts of Britain, is an annual, having divergent pods covered with stiff hairs, the valves 5-nerved, the seeds yellowish, the leaves pinnatifid.—Both these species are cultivated in England and elsewhere, for their seeds, which are ground into powder and mixed with water, to make the well-known condiment called *mustard*. The powder of the seeds is also much used in medicine as a rubefacient. The use of mustard as a condiment is often found favorable to digestion. Mustard seeds depend for their pungency on a principlewhich, when water is added to black mustard, forms *volatile oil of mustard*. (See next article.) There is also in the seeds a bland fixed oil, *oil of mustard*, which is obtained from them by expression, and constitutes about 28 per cent of their weight. The cake which remains after the oil is expressed is too acrid to be freely used for feeding cattle. It is black mustard which is chiefly cultivated, its seeds being more pungent and powerful than that of white mustard; but there is more difficulty in removing the skin of its seed than that of white mustard, which is therefore often preferred, but more in England than on the continent of Europe. Mustard requires a very rich soil. It is cultivated on the alluvial lands of the level eastern counties of England. Wisbeach, in Cambridgeshire, is the great mustard market of England.—White mustard is often sown in gardens and forced in hot-houses, to be used in the seed-leaf as a small salad, having a pleasant pungency. It is also sometimes sown for feeding sheep, when turnip or rape has failed, being of very rapid growth, although inferior in quantity of crop.—Wild Mustard, or Charlock (*S. arvensis*), which is distinguished by turgid and knotty pods with many angles and longer than the two-edged beak, is a most troublesome annual weed in cornfields in Britain, often making them yellow with its flowers in the beginning of summer. Its seeds are said to have yielded the original *Durham mustard*, and are still gathered for mixing with those of the cultivated species. The bland oil of the seeds is used for lamps. —Pekin Mustard (*S. Pekinensis*) is an annual, very extensively cultivated in China, its leaves being used as greens. It is quite hardy in the climate of Britain.—Indian Mustard (*S. ramosa*) is extensively cultivated in India for its seeds, which are used as a condiment; as are those of *S. dichotoma* and *S. glauca*, also cultivated in India. The oil of the seeds is much used throughout India for lamps.—Hill Mustard is a different genus, *bunias* (q.v.)—The Mustard Tree of Scripture is supposed to be *salvadora Persica*, a small tree of the natural order *salvadoraceæ*, a small order allied to *myrsinaceæ*. It abounds in many parts of the east. The seed has no aromatic pungency, and is used like mustard. The fruit is a berry with a pungent taste.

Manufacture.—The manufacture of mustard as it was originally used in this country, and as it still is on the continent, consisted in simply grinding the seed into a very fine meal. A false taste, however, arose for having an improved color, and the flour of mustard was introduced, in which only the interior portion of the seed is used, the husk being separated, as the bran is from wheaten flour. This causes a great loss of flavor, as the pungent oil, on which the flavor chiefly depends, exists in greatest abundance in the husk.—Hence other materials, such as capsicum powder, and other very pungent matters, are added to bring up the flavor, and wheaten flour and other substances are added to increase the bulk and the lightness of color. Indeed, so many sophistications have been added that the mustard of the English tables can no longer be regarded in any other light than an elaborately compounded condiment, for which each manufacturer has his own particular recipe.

MUSTARD, Oil of. The seeds both of the black and the white mustard yield by expression a large quantity of a bland fixed oil, but they do not contain any essential or volatile oil ready formed. It is only the black mustard which by distillation yields the compound usually known as the oil or essence of mustard, and which is in reality sulphocyanide of allyl (see Garlic, Oil of) contaminated with a little brown resinous matter, from which it may be freed by simple re-distillation.

When first obtained, it is a colorless fluid, which gradually becomes yellowish. It has a painfully pungent odor and acrid taste; and when applied to the skin, it speedily raises a blister. It is soluble in all proportions in alcohol, but dissolves very sparingly in water. In the article already referred to, it has been shown that this oil and oil of garlic are naturally convertible into one another; in combination with ammonia it forms a compound which is termed *thiosinnamine*, and which combines directly with acids like a true organic base. Its mode of formation is explained by the equation:

$$\overbrace{C_6H_5,C_2NS_2}^{\text{Oil of Mustard.}} + \overbrace{NH_3}^{\text{Ammonia.}} = \overbrace{C_8H_8N_2S_2}^{\text{Thiosinnamine.}}$$

By digesting oil of mustard with alkalies, or with hydrated oxide of lead, we also obtain a feeble base termed *sinapoline*, whose formula is $C_{14}H_{12}N_2O_2$.

The oil is formed in much the same way as the volatile oil of almonds (q.v.) The black mustard contains the potash salt of a compound termed *myronic acid*, and a peculiar coagulable nitrogenous ferment, which, when the crushed seed is moistened with water, act upon each other, and develop the oil. It is the gradual formation of this oil, when powdered mustard and warm water are mixed, that occasions the special action of the common mustard poultice. The pungency of mustard as a condiment, of horse-radish, etc., is mainly due to the presence of this oil.

MUSTELIDÆ, a family of digitigrade carnivora (q.v)., mostly forming the genus *mustela* of Linnæus; now divided into a number of genera, in which are ranked the weasel, ermine or stoat, sable, marten, ferret, polecat, mink, skunk, etc. The mustelidæ are distinguished by the elongated form of the body and the shortness of the limbs; also by having generally four or five molars on each side in the upper jaw, and five or six in the lower. On each side of both jaws there is a single tuberculate tooth. All the feet have five toes. The skull is much elongated behind the eyes. The mustelidæ display great litheness and suppleness of movement. They are very carnivorous. Otters are ranked among the mustelidæ.

MUSTER (It. *mostrare*, from Lat. *monstrare*, to show) is a calling over of the names of all the men composing a regiment or a ship's company. Each man present answers to his name, those not answering being returned as absent. The muster-roll from which the names are called is the pay-master's voucher for the pay he issues, and must be signed by the commanding officer, the adjutant, and himself. The crime of signing a false muster-roll, or of personating another individual at a muster, is held most severely punishable—by imprisonment and flogging for a common soldier, by immediate cashiering in the case of an officer. In regiments of the line a muster is taken on the 24th of each month; in ships of war, weekly. The muster after a battle is a melancholy proceeding, intended to show the casualities death has wrought. In early times, before the army was a standing force, and when each captain was a sort of contractor to the crown for so many men, the muster was most important as the only security the sovereign had that he really obtained the services of the number of men for whom he paid. Accordingly, any fraud, as making a false return, or as mustering with his troop men not actually serving in it, was by the articles of war of Henry V. made punishable with death for the second offense, and by Charles I. with death "without mercy" for even the first such crime; while any person abetting in any way in the fraud shared the penalty.

MUTE, a small instrument used to modify the sound of the violin or violoncello. It is made of hard wood, ivory, or brass, and is attached to the bridge by means of a slit, a leg of it being interjected between every two strings. The use of the mute both softens the tone and imparts to it a peculiar muffled and tremulous quality, which is sometimes very effective. Its application is indicated by the letters *c.s.*, or *con sordino*, and its discontinuance by *s.s.*, or *senza sordino*. The mute is sometimes used for the cornet, being inserted into the bell of the instrument, thereby subduing the sound and producing the effect of great distance.

MUTINY (Fr. *mutiner*, from *mutin*, "riotous." "Mutin" is connected with the old French *meute*, still seen in *émeute*, a "sedition," and is therefore from the Latin *movere*, "to move" or "stir up." The supposition that the word is derived from the Latin *mutio*, a "muttering," is a mistake). The term is used to denote behavior either by word or deed subversive of discipline, or tending to undermine superior authority. Till lately mutiny comprised speaking disrespectfully of the sovereign, royal family, or general commanding, quarreling, and resisting arrest while quarreling; but these offenses have now been reduced to the lesser crime of "mutinous conduct." The acts now constituting mutiny proper are exciting, causing, or joining in any mutiny or sedition; when present thereat, failing to use the utmort effort to suppress it; when, knowing of a mutiny or intended mutiny, failing to give notice of it to the commanding officer; striking a superior officer, or using or offering any violence against him while in the execution of his duty: disobeying the lawful command of a superior officer. The punishment awarded by the mutiny act to these crimes is, if the culprit be an officer, death or such other punishment as a general court-martial shall award; if a soldier, death,

penal servitude for not less than four years, or such other punishment as a general court-martial shall award. As the crime of mutiny has a tendency to immediately destroy all authority and all cohesion in the naval or military body, commanding officers have strong powers to stop it summarily. A drum-head court-martial may sentence an offender, and if the case be urgent, and the spread of the mutiny apprehended, the immediate execution of the mutineer may follow within a few minutes of the detection of his crime. It, however, behooves commanding officers to exercise this extraordinary power with great caution, as the use of so absolute an authority is narrowly and jealously watched. To prevent mutiny among men the officers should be strict without harshness, kind without familiarity, attentive to all the just rights of their subordinates, and, above all things, most particular in the carrying out to the very letter of any promise they may have made.

MUTINY ACT was an act of the British parliament passed from year to year, investing the crown with powers to regulate the government of the army and navy, and to frame the articles of war. By the bill of rights, the maintenance of a standing army in time of peace, unless by consent of parliament, was declared illegal, and from that time the number of troops to be maintained, and the cost of the different branches of the service, have been regulated by an annual vote of the house of commons. But parliament possesses a further and very important source of control over the army. Soldiers, in time of war or rebellion, being subject to martial law, may be punished for mutiny or desertion; but the occurrence of a mutiny in certain Scotch regiments soon after the revolution, raised the question whether military discipline could be maintained in time of peace; and it was decided by the courts of law, that, in the absence of any statute to enforce discipline and punish military offenses, a soldier was only amenable to the common law of the country: if he deserted, he was only liable for breach of contract, or if he struck his officer, to an indictment for assault. The authority of the legislature thus became indispensable to the maintenance of military discipline, and parliament has, since 1689, at the beginning of every session, conferred this and other powers in an act called the mutiny act, limited in its duration to a year. Although it is greatly changed from the form in which it first passed, 175 years ago, the annual alterations in this act are now very slight, and substantially it has a fixed form. The preamble starts with the above quoted declaration from the bill of rights, and adds that it is judged necessary by the sovereign and parliament that a force of such a number should be continued, "for the safety of the United Kingdom, the defense of the possessions of the crown;" while it gives authority to the sovereign to enact articles of war for the control and government of the force granted. The act comprises 107 clauses, of which the first five specify the persons liable to its provisions—viz., all enlisted soldiers or commissioned officers on full pay, and to those of the regular army, militia, or yeomanry, when employed on active service, and to recruits for the militia while under training. Clauses 6 to 14 treat of courts-martial, their procedure and powers. Clauses 15 to 28 relate to crimes and their punishment, the leading offenses being mutiny, desertion, cowardice, treason, insubordination, for each of which death may be the penalty; frauds, embezzlement, etc., for which penal servitude is awarded. Clauses 29 to 33 provide for the government of military prisons, and for the reception of soldiers in civil jails, under the sentences of courts-martial. Clauses 34 to 37 enact rules to guide civil magistrates in apprehending deserters or persons suspected of desertion. Clause 38 refers to furlough; 39 to 41, on the privileges of soldiers, enact that officers may not be sheriffs or mayors; that no person acquitted or convicted by a civil magistrate or jury be tried by court-martial for the same offense; and that soldiers can only be taken out of the service for debts above £30, and for felony or misdemeanor. Clauses 42 to 59 have reference to enlistment (q.v.); 60 to 74 to stoppages, billets, carriages, and ferries, providing for the compulsory conveyance and entertainment of troops by innkeepers. Clause 75 relates to the discharge of soldiers; and the remaining 23 clauses advert to miscellaneous matters, and the penalties under the act on civil functionaries who neglect to comply with its requirements. By clauses 105 and 106 the militia, yeomanry, and volunteers, may, on emergency, be attached to the regular forces. Clause 107 renders a soldier liable to maintain his wife and children, and his bastard children.

MUTIUS SCÆVOLA. See MUCIUS SCÆVOLA.

MUTSUHITO or MUTS-HITO. The present reigning emperor of Japan, and the 123d mikado of the line. His name means the "man of peace," or "weak man." He has no family name. He is the second son of the mikado Komei Tennō (1847–67); his mother Fujiwara Asako. He was born Nov. 3, 1852, and grew up in the palace at Kioto, never seeing a foreigner until his nineteenth year. On the death of his father Jan. 30, 1867, he was declared emperor under the care of a regent. Upon the *coup d'etat* of Iwakura and others, Jan. 3, 1868, the regent was dismissed. Mutsuhito became the active mikado, and the new government was proclaimed; the decree abolishing forever the office of "tycoon" being dated Feb. 4. On March 23 he gave the first audience ever granted by an emperor of Japan to representatives of Christian nations, the envoys of France and Holland being admitted. The British minister (see PARKER, SIR H. S.) who on the 27th attempted a similar audience, had his cortege attacked by assassins. On March 28 the imperial decree was issued by which treaty relations with foreign

nations were for the first time acknowledged by the mikado, and all fanatics who should attack foreigners were outlawed. On April 6, in the great hall of the castle of Nijo in Kioto, occurred the most momentous act of his life, and thence dates the real beginning of modern Japan. In presence of the court nobles and feudal princes (daimios) the mikado took the oath which is now the basis of the new government. The first clause of this oath is as follows: "The practice of discussion and debate shall be universally adopted, and all measures shall be adopted by public argument." Besides this he promised that the "uncivilized customs of former times" should be broken through, and intellect and learning sought for throughout the world, to assist in leading Japan into the path of modern civilization. From this oath the reforms of the past twelve years have proceeded, and the drift of Japanese politics toward constitutional government has begun. On Feb. 7, 1869, he removed the national capital to Tokio, and soon after married Ichijo Tadaka, a noble lady of the 2d degree of the 1st rank. In 1872 he adopted European dress and habits of life, and has since made many tours throughout the empire, completely revolutionizing the old traditional court and governmental etiquette.

MUTTRA, or MATHURÁ, a t. of British India, capital of a district in the n.w. provinces, 97 m. s.s.e. of Delhi, is situated on the right bank of the Jumna. The fort was built by the celebrated astronomer, Jey Singh (who became prince of Amber in 1693); and on the roof of one of the apartments is a ruinous observatory, containing a great number of astronomical instruments. Access is had to the river—which, along with the town, is considered sacred by the Hindus—by numerous ghâts, ornamented with little temples; and its banks are, every morning and evening, crowded by devotees of all ages and both sexes, to perform their religious exercises. In Hindu mythology, it is regarded as the birthplace of the divinity Krishna. In honor of the monkey-god Hanuman, monkeys are here protected and fed, being allowed to swarm everywhere. There are also great numbers of paroquets, peacocks, and sacred bulls at large, without owners. There is a very extensive military cantonment about a mile s. of the town. Muttra appears at an early period to have been of much more importance than it is at present; and its enormous wealth and splendor made it an object of attack to the first Afghan invaders. Mahmud of Ghuznee, in 1017, gave it up to plunder, breaking down and burning all the idols, and amassing a vast quantity of gold and silver, of which the idols were made. After this calamity, it sank into comparative obscurity. In Oct., 1803, it was, without resistance, occupied by the British troops. Pop. '72, 59,281.

MU'TUAL INSTRUCTION. See MONITORIAL SYSTEM.

MU'TULE, a plain block under the corona of the cornice of the Doric style, similar in position to the modallio of the Corinthian order, and having a number of guttæ or drops worked on the under side. See ENTABLATURE.

MU'TUUM is a term used in Scotch law, borrowed from the Roman law, to denote a contract of loan of a certain kind of things, as corn, wine, money, which are consumed in the use, and as to which the borrower is bound to restore as much of the same kind at some future time.

MUYSCAS, or CHIBELAS, a nation of Indians w. of the Andes, in New Granada, as far as the vicinity of Santa Fé de Bogota. They seem to have been the nearest in civilization to the Quichuans. They were quickly Christianized, and, like all these tribes, on the expulsion of the Jesuits, decreased rapidly in numbers and intelligence. It seems uncertain whether the language is really extinct, but it was simple, and is usually considered unconnected with any neighboring group.

MUZA IBN NOSEYR, the Arab conqueror of Spain, was born 640 A.D. He displayed great bravery and high military talents in the contests of that turbulent period, so much so that he was appointed by the caliph general of the army which was raised for the conquest of Africa in 698–99. After an insignificant expedition into the interior of Africa, he set out in 707 for Mauritania, conquering the kindred tribes of eastern Barbary, and enrolling their warriors under his standard; and by 709 the whole of northern Africa, including the Gothic strongholds on the coast, acknowledged the authority of the caliph. At this period the Gothic monarchy in Spain was in a state of complete disorganization, and Muza Ibn Noseyr, seizing the favorable opportunity thus presented, sent his lieut., Tarik Ibn Zeiad, in April, 711, to make an incursion into Spain. Tarik landed at Gibraltar, marched inland to the banks of the Guadalete, where he was met by Roderic the Gothic king. In the battle which ensued the Goths were decisively vanquished, their king perished in the waters of the Guadalete, and the whole of southern Spain lay at the mercy of the victor. Muza Ibn Noseyr, on hearing of these successes, sent orders to Tarik to halt for further instructions; but the lieutenant, flushed with success, pressed on to the very center of Spain, and seized Toledo, the capital of the Gothic kingdom. Muza Ibn Noseyr immediately set out for Spain at the head of 18,000 men (June, 712), took Seville, Carmona, Merida, and other towns, and then marched upon Toledo, where he joined Tarik, whom he caused to be bastinadoed and incarcerated, but afterwards reinstated in obedience to an order from the caliph. Muza Ibn Noseyr then marched first n.w. and then e., subduing the country as he went; he then crossed the Pyrenees into France, but soon after returned to Spain, where he and Tarik received messages from the caliph, commanding their immediate presence at

Damascus; Tarik immediately obeyed, but Muza Ibn Noseyr delayed till a second message was sent to him. On reaching Damascus he was treated with neglect, and, on the accession of the caliph Suleiman, was cast into prison, and mulcted in 200,000 pieces of gold; his two sons were deprived of their governments of Kairwan and Tangier; and the third son, who governed Spain in his father's absence, was beheaded, and his head sent to Muza. Muza Ibn Noseyr died soon after in the greatest poverty, at Hedjaz, 717 A.D.

MUZIANO, Girolamo, 1528–90; b. Aquafredda, near Brescia, Italy; hence his title, Bressano, or Brescianino. His first instructor was the painter Girolamo Romanino. He afterwards studied at Venice and Rome, and devoted himself to the painting of landscapes. His earliest important painting, "The Resurrection of Lazurus," attracted the attention of Michael Angelo, who was so struck by its bold and accurate design that he took Muziano under his protection and secured for him a large number of commissions. Muziano made a study of mosaics, and vastly improved that branch of art. He founded and richly endowed the famous academy of St. Luke. The most of his pictures are in the churches and palaces of Rome, where he spent the larger part of his life. Among them may be mentioned: "St. Jerome," and a "Descent from the Cross" (Borghese palace); "St. Jerome" (Doria palace); "St. Francis" (Mattei palace); "Resurrection of Lazurus" (Vatican); "St. Matthew and St. Paul" (Ara Coeli); "Annunciation" (St. Urban's); "Nativity of Jesus Christ" (Madonna de' Monti); "St. Nicholas" (St. Louis-des-Français); "Cristo Morto" (Santa Cattarina); "Jesus Christ giving the Keys to St. Peter," and a "Flagellation" (in the sacristy of St. Peter's). His frescos are to be seen in the Vatican, at Foligno, etc. The galleries of Bologna, Dresden, Reims, and the Louvre possess specimens of Muziano's work. His designs in India ink are highly prized. He is distinguished for his excellence in design and coloring; for the nobility of his conceptions, and the characteristic expression of his faces. His frescos are sometimes rather sharp and hard in outline and color. Died in Rome, honored as one of the greatest painters in the school of Michael Angelo.

MUZZEY, Artemas Bowers, b. Mass., 1802; educated at Harvard college and the Harvard divinity school. He was settled over the Unitarian church in Framingham in 1830, and was afterwards minister of Unitarian churches in Cambridgeport, Cambridge, and Concord, N. H. His last charge was at Newburyport, Mass., where he remained till 1865, when he retired from the pulpit. Among his numerous works, aside from sermons and tracts, may be mentioned: *The Young Man's Friend*, 1836; *The Young Maiden*, 1840, which had a great success; *Man a Soul*, 1842; *The Sabbath-School Hymn and Tune Book*, 1855; *The Blade and the Ear*, 1864; and *The Higher Education*, 1871.

MYACITES, a genus of extinct lamellibranchiate mollusks, belonging to the family *anatinidæ*. They commenced their existence in the Silurian formation, and extended through the triassie and Jurassic into the cretaceous, where they became extinct. They had a gaping ventricose shell, with an external ligament.

MYCALE, the ancient name of a mountain now called Samsun, in the s. of Ionia in Asia Minor. It terminates in the promontory cape Santa Maria, opposite the island of Samos. The strait between the island and the promontory is where the great nava. victory of the Greeks over the Persians took place 479 B.C.

MYCE'LIUM, in botany, a development of vegetable life peculiar to *fungi*, but apparently common to all the species of that order. The *spawn* of mushrooms is the mycelium. The mycelium appears to be a provision for the propagation of the plant where its spores may not reach, its extension in the soil or matrix in which it exists, and its preservation when circumstances are unfavorable to its further development. It consists of elongated filaments, simple or jointed, situated either within the matrix or upon its surface. It is often membranous or pulpy. The development of the fungus in its proper form seems to be ready to take place, in proper circumstances, from any part of the mycelium. Fungi often remain long in the state of mycelium, and many kinds of mycelium have been described as distinct species and formed into genera. Fries has rendered great service to botany in investigating these spurious species and genera, and determining their true nature. Liquors in which the flocculent mycelius of a fungus is spreading are said to be *mothery*.

MYCE'NÆ, a very ancient city in the north-eastern part of Argolis, in the Peloponnesus, built upon a craggy height, is said to have been founded by Perseus. It was the capital of Agamemnon's kingdom, and was at that time the principal city in Greece. About 468 B.C., it was destroyed by the inhabitants of Argos, and never rose again from its ruins to anything like its former prosperity. In Strabo's time its ruins only remained; these are still to be seen in the neighborhood of Kharvati, and are specimens of Cyclopean architecture. The most celebrated is the "Gate of Lions," the chief entrance to the ancient Acropolis. Excavations prosecuted at Mycenæ by Dr. Henry Schliemann brought to light in 1876 several ancient tombs, containing a large quantity of gold and silver ornaments, etc.

MYCETES, a genus of South American monkeys. See Howler, *ante*.

MYELI'TIS (*myelos*, marrow), is the term employed to signify inflammation of the substance of the spinal cord. It may be either acute or chronic, but the latter is by far the

most common affection. The *chronic* form begins with a little uneasiness in the spine, somewhat disordered sensations in the extremities, and unusual fatigue after any slight exertion. After a short time paralytic symptoms appear, and slowly increase. The gait becomes uncertain and tottering, and at length the limbs fail to support the body. The paralysis finally attacks the bladder and rectum, and the evacuations are discharged involuntarily; and death takes place as the result of exhaustion, or occasionally of asphyxia if the paralysis involves the chest. In the *acute* form there is much pain (especially in the spinal region), which usually ceases when paralysis supervenes. The other symptons are the same as those of the chronic form, but they occur more rapidly and with greater severity, and death sometimes takes place in a few days.

The most common causes of this disease are falls, blows, and strains from over-exertion; but sexual abuses and intemperate habits occasionally induce it. It may also result from other diseases of the spine (as caries), or may be propagated from inflammation of the corresponding tissue of the brain.

The treatment, which is much the same as that of inflammation elsewhere, must be confided entirely to the medical practitioner; and it is therefore unnecessary to enter into any details regarding it. When confirmed paralysis has set in, there is little to hope for. but in the early stage the disease is often checked by judicious remedies.

MYENSK, a t. of European Russia, in the government of Orel, on the Zusho. It has thirteen churches, and a pop. of nearly 13,000. It has a lively trade chiefly in spirits, soap, hemp, and dried fruits.

MYER, Albert J., 1828–80, b. N. Y.; son of a jeweler who established himself in that business in Buffalo, N. Y., while Albert was a child. He graduated at Hobart college, Geneva, N. Y., in 1847; and, returning to Buffalo, began the study of medicine with Dr. Frank H. Hamilton, and took his degree of M.D., at the university of Buffalo in 1851. In 1854 he was appointed assistant surgeon in the U. S. army, and assigned to Texas, where he first developed his now celebrated signal system, and which was adopted by the secretary of war for the use of the army. From 1858 to '60 Myer was a signal officer with the rank of major. On the outbreak of the war he was made signal officer on the staff of gen. Butler, and afterwards on that of gen. McClellan, and was successively brevetted lieut.col., col., and brig.gen.; his last promotion being for "distinguished services in organizing, instructing, and commanding the signal corps of the army, and for especial service on Oct. 5, 1864, at Allatoona, Ga.;" on July 28, 1866, he was made colonel in the regular army and chief signal officer. In 1870 he commenced his work of observing and giving notice by telegraph of the approach and force of storms on the northern lakes and sea-coast, at the military post in the interior, and at other points in the states and territories. He organized the meteorological division of the signal service, and in 1873, by special act of congress, was placed in charge of the telegraphic duties in this connection, and authorized to establish signal stations at lighthouses and live-saving stations. In the same year he was a delegate to the meteorological congress held in Vienna. Gen. Myer published *A Manual of Signals for the United States Army.* On the last day of the last session of Congress before his death he received his promotion to the full rank of brig.gen. of the U. S. army. On account of the publication in the leading newspapers, of the daily telegraphic prognostications of the weather-bureau, under the head of "probabilities"; gen. Myer was familiarly and playfully known by the name "old probabilities."

MYERS, Peter Hamilton, b. N. Y. 1812; made his first appearance as an author, in 1848, when he published *The First of the Knickerbockers, a Tale of* 1673. He has since written a number of novels, among which are *The Young Patroon,* 1848; *The King of the Hurons;* and *The Prisoner of the Border,* 1857. He has published also a book of poems called *Ensenore, a Romance of Owasco Lake.*

MY'GALE, a genus of spiders, the type of a family *Mygalidæ.* They have four pulmonary sacs and spiracles, four spinnerets, eight eyes, and hairy legs. They make silken nests in clefts of trees, rocks, etc., or in the ground, sometimes burrowing to a great depth, and very tortuously. To this genus belongs the bird-catching spider (q.v.) of Surinam; but it seems now to be ascertained that several of the larger species frequently prey on small vertebrate animals. They do not take their prey by means of webs, but hunt for it and pounce upon it by surprise. They construct a silken dwelling for themselves in some sheltered retreat. Some of them make a curious lid to their nest or burrow. They envelop their eggs, which are numerous, in a kind of cocoon.

MYLA'BRIS, a genus of coleopterous insects, nearly allied to *Cantharis* (q.v.), and deserving of notice because of the use made of some of the species as blistering flies. *M. cichorii* is thus used in China and India; and *M. Fuesselini,* a native of the south of Europe, is supposed to have been the blistering fly of the ancients.

MYLI'TTA (? corresponding to Heb. *Meyaledeth,* Genitrix, who causes to bear), a female deity, apparently first worshiped among the Babylonians, who gradually spread her worship through Assyria and Persia. She is originally, like almost every other mythological deity, a cosmic symbol, and represents the female portion of the twofold principles through which all creation burst into existence, and which alone, by its united active and passive powers, upholds it. Mylitta is to a certain degree the representative

of earth, the mother, who conceives from the sun, Bel or Baal. Mylitta and Baal together are considered the type of the "Good." Procreation thus being the basis of Mylitta's office in nature, the act itself became a kind of worship to Mylitta, and was hallowed through and for her. Thus it came to pass, that every Babylonian woman had once in her life to give herself up to a stranger, and thereby considered her person consecrated to the great goddess. The sacrifice itself seems, especially in the early stage of its introduction among the divine rites of the primitive Eabylonians, to have had much less of the repulsiveness, which, in the eyes of highly cultivated nations, must be attached to it; and it was only in later days that it gave rise to the proverbial Babylonian lewdness. Herodotus's account of this subject must, like almost all his other stories, be received with great caution.

MYLIOBATIDÆ. See RAY.

MY'LODON (Gr. grinder-teeth), a genus of huge fossil sloths, whose remains are found in the Pleistocene deposits of South America, associated with the *Megatherium* and other allied genera. A complete skeleton, dug up at Buenos Ayres, measured 11 ft. from the fore part of the skull to the end of the tail. Although like the modern sloth in general structure and dentition, its immense size forbids us to suppose that it could have had the same arboreal habits, and the modifications of its structure seem to have fitted it for the uprooting and prostrating of the trees, the foliage of which supplied it with food.

MY'NIAS, more accurately MINYAS, was, in Greek mythology, the son of Chryses. He was king of Jolcos, and gave his name to the people called *Minyæ.* He built the city of Orchomenus, where rites (named after him) were selected in his honor. His three daughters, Clymene, Iris, and Alcithoë, according to Ovid, but Leuconoë, Leucippe, and Alcithoë according to other authors, were changed into bats for having contemned the mysteries of Bacchus.

MYNPURI, or **MAINPURI,** a t. of British India, capital of a district in the n.w. provinces, is situated on the banks of a small affluent of the Ganges, 160 m. s.e. of Delhi. It lies at an elevation of 620 ft. above the sea, and is a favorite station for troops, as provisions and water are abundant and good. Mynpuri possesses a Jain temple. The rebels were driven from this place in 1857. Pop. '71, 21,179.

MYOSO'TIS. See FORGET-ME-NOT.

MYOX'IDÆ, a family of rodents commonly known as dormice. From their resemblance to many of the squirrels and marmots they have sometimes been placed in the fumily *sciuridæ.* The common dormouse, *myaxus avillanarius,* is a well-known hibernating British species. The family are confined to the old world, and contain about 12 species. They have 4 rooted molars on each side of the jaw, a rudimentary thumb, and are destitute of a *cæcum.* See RODENTIA.

MYR'CIA, a genus of trees of the natural order *Myrtaceæ,* to which belongs the Wild Clove or Wild Cinnamon of the West Indies (*myrtaceæ acris*), a handsome tree of 20 or 30 feet high. Its timber is very hard, red and heavy. Its leaves have an aromatic cinnamon-like smell, and an agreeable astringency, and are used in sauces. Its berries are round, and as large as peas, have an aromatic smell and taste, and are used for culinary purposes.

MYR'IAGRAM. See METRIC SYSTEM.

MYRIAM'ETER. See METRIC SYSTEM.

MYRIA'PODA (Gr. myriad-footed), a class of *Articulata,* resembling *Annelida* in their lengthened form, and in the great number of equal, or nearly equal, segments of which the body is composed; but in most of their other characters more nearly agreeing with insects, among which they were ranked by the earlier naturalists, and still are by some. They have a distinct head, but there is no distinction of the other segments, as in insects, into thorax and abdomen. They have simple or compound eyes; a few are destitute of eyes. They have antennæ like those of insects. The mouth is furnished with a complex masticating apparatus, in some resembling that of some insects in a larval state, in others, similar to that of crustaceans. Respiration is carried on through minute pores or spiracles, placed on each side along the entire length of the body, the air being distributed by innumerable ramifying air-tubes to all parts. In most parts of their internal organization the myriapoda resemble insects; although a decided inferiority is exhibited, particularly in the less perfect concentration of the nervous system. The resemblance is greater to insects in their larval than in their perfect state. The body of the myriapoda is protected by a hard *chitinous* covering. The number of segments is various, seldom fewer than 24; although in some of the higher genera they are consolidated together in pairs, so that each pair, unless closely examined, might be considered as one segment bearing two pairs of feet. The legs of some of the lower kinds, as *Julus* (q.v.) are very numerous, and may be regarded as intermediate between the bristle-like appendages which serve many annelids as organs of locomotion, and the distinctly articulated legs of insects. In the higher myriapoda, as *Scolopendra,* the legs are much fewer, and articulated like those of insects. None of the myriapoda have wings. Some of them feed on decaying organic matter, chiefly vegetable; those of higher organization are carnivorous. The myriapoda do not undergo changes so great

as those of insects, but emerge from the egg more similar to what they are ultimately to become; although some of them are at first quite destitute of feet; and, contrary to what takes place in insects, the body becomes more elongated as maturity is approached, the number of segments and of feet increasing.
